A REPRINT

OF THE LAST (1880) EDINBURGH AND LONDON EDITION

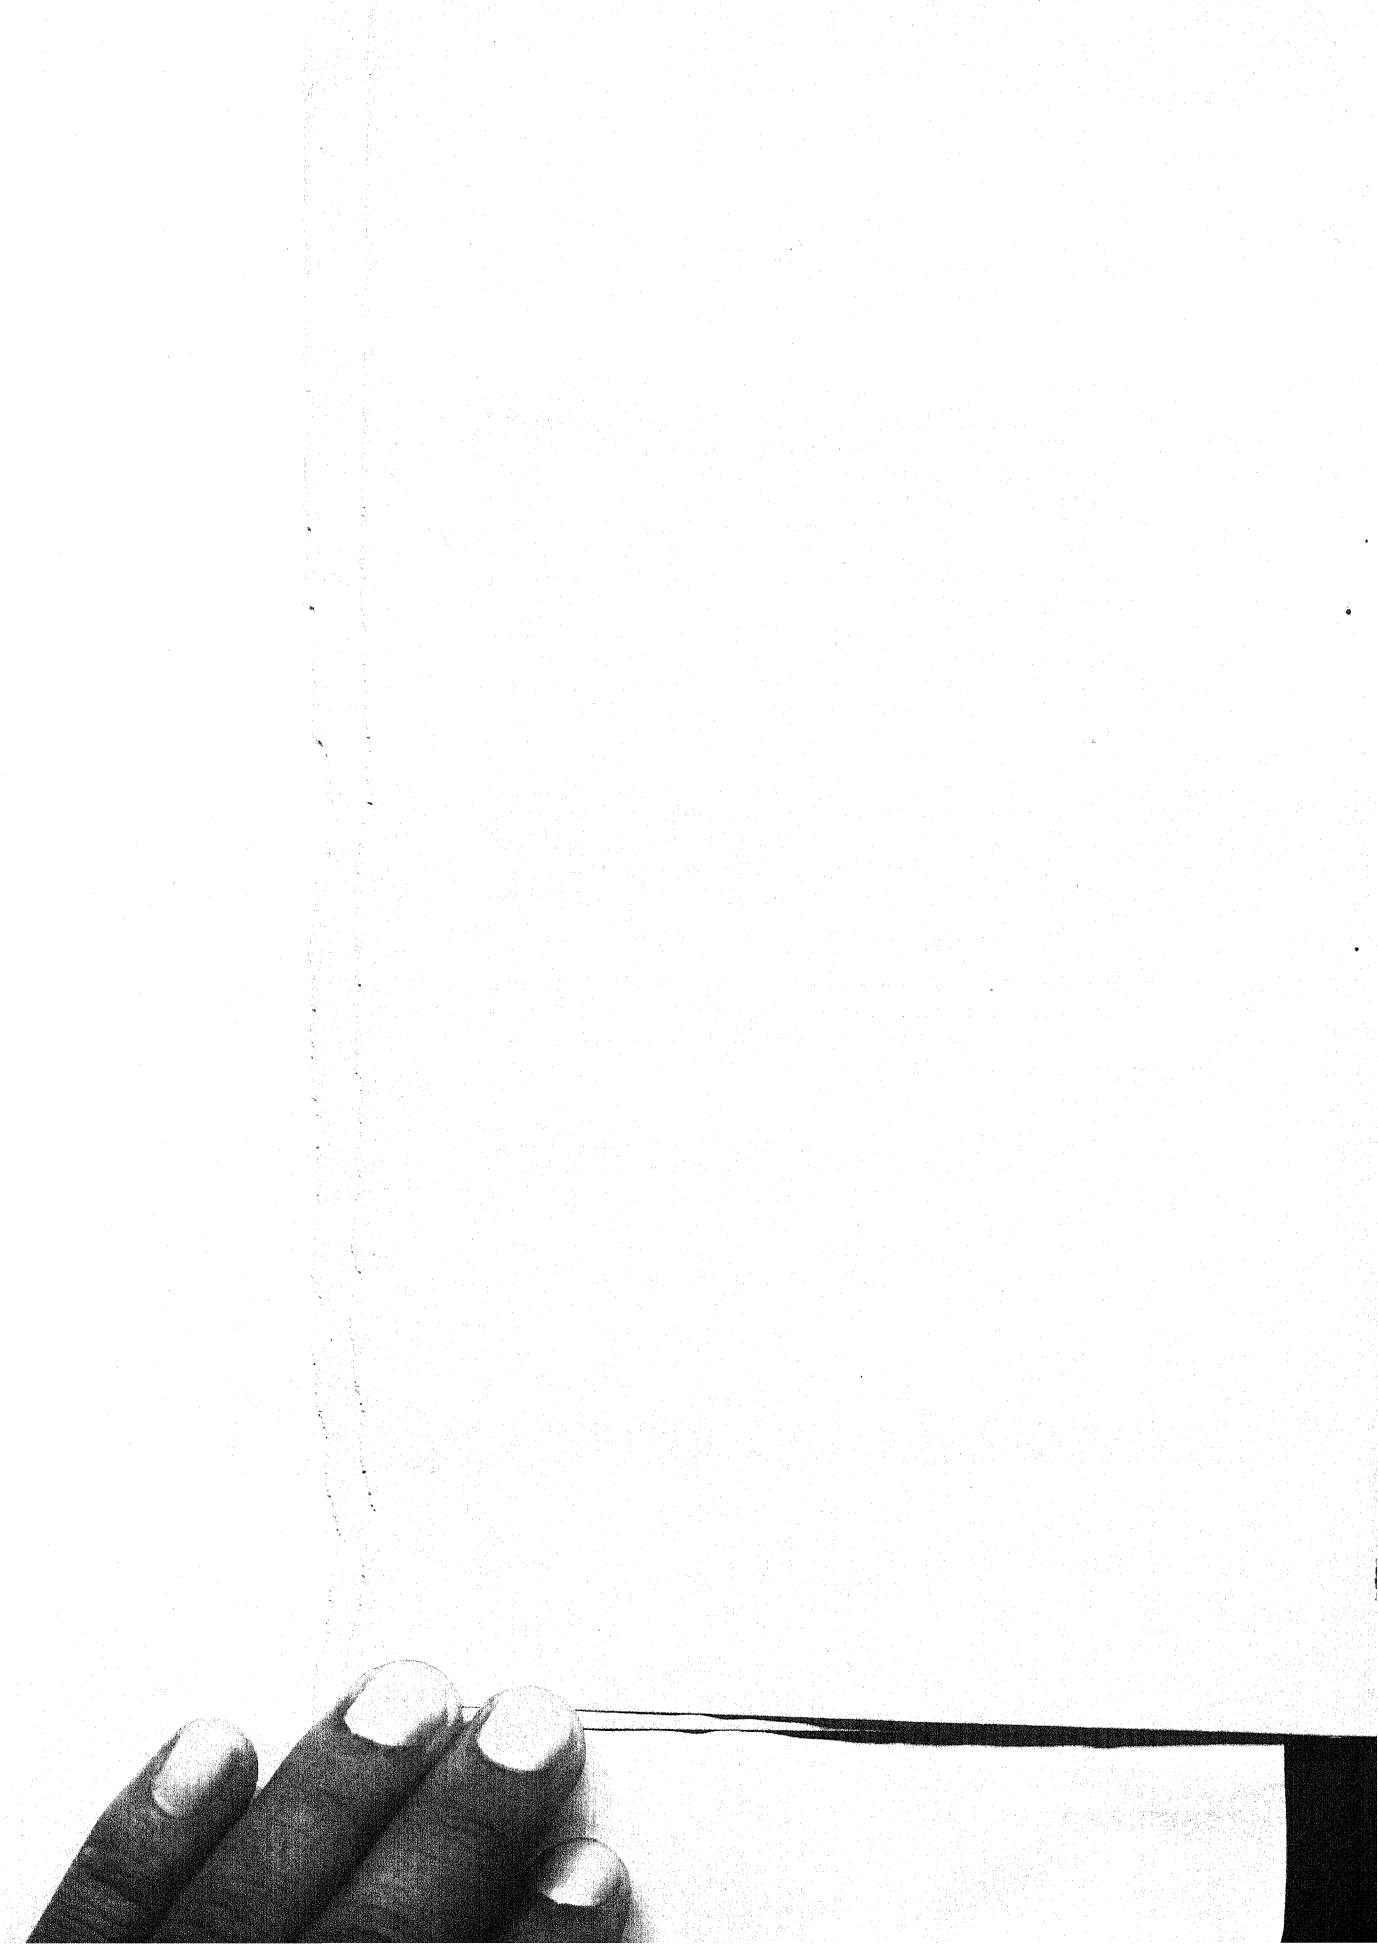
OF CHAMBERS'S ENCYCLOPÆDIA,

With Copious Additions by American Editors.

FIFTEEN VOLUMES.

VOLUME IX.

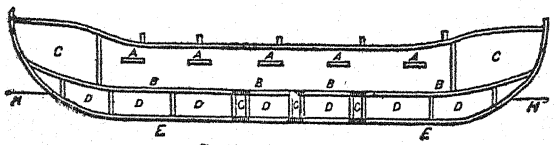
NEW YORK:
AMERICAN BOOK EXCHANGE,
764 BROADWAY,
1881.



AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA**. The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—AMERICA. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.



The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

COPYRIGHT, 1880, BY
THE AMERICAN BOOK EXCHANGE.

LIFE-BOAT, a boat adapted to "live" in a stormy sea, with a view to the saving of life from shipwreck. Its qualities must be buoyancy, to avoid foundering when a sea is shipped; strength to escape destruction from the violence of waves, from a rocky beach, or from collision with the wreck; facility in turning; and a power of righting when capsized.

A melancholy wreck at Tynemouth, in Sept., 1789, suggested to the subscribers to the South Shields news-room, who had witnessed the destruction of the crew one by one, that some special construction of boat might be devised for saving life from stranded vessels. They immediately offered a premium for the best form of life-boat; and the first boat built with the express object of saving life was that constructed on this occasion by Mr. Henry Greathead. It was of great strength, having the form of the quarter of a spheroid, with sides protected and rendered buoyant within and without by the superposition of layers of cork. So useful was it in the first twenty-one years after its introduction that 300 lives were saved through its instrumentality in the mouth of the Tyne alone. Mr. Greathead received the gold medals of the society of arts and royal humane society, £1200 from parliament in 1802, and a purse of 100 guineas from Lloyd's, the members of which society also voted £2,000 to encourage the building of life-boats on different parts of the coast. Although various other life-boats were invented from time to time, Greathead's remained the general favorite until about the year 1851, and many of his construction are still to be seen on different points of the coast. They failed, however, occasionally; and several sad mishaps befell the crews of life-boats, especially in the case of one at South Shields, in which twenty pilots perished. Upon this the

Section lengthwise.

duke of Northumberland offered a prize for an improved construction, and numerous designs were submitted, a hundred of the best of which were exhibited in 1851. Mr. James Beeching of Yarmouth obtained the award; but his boat was not considered entirely satisfactory, and Mr. R. Peake, of her majesty's dockyard at Woolwich, was intrusted with the task of producing a life-boat which should combine the best qualities of the different inventions. His efforts were very successful, and the national life-boat institution adopted his model as the standard for the boats they should thereafter establish on the coasts.

Sections of Mr. Peake's life-boat are shown above, one lengthwise through the keel, the other crosswise in the middle. A, A, are the thwarts on which the rowers sit; BB, a water-tight deck, raised sufficiently above the bottom of the boat to be above the level of the sea when the boat is loaded; C, C, are air-tight chambers running along each side, and occupying from 3 to 4 ft. at each end: the buoyancy afforded by these more than suffices to sustain the boat when fully laden, even if filled with water. To diminish the liability to capsize in a heavy sea, the life-boat has great beam (breadth) in proportion to her length, viz., 8 ft. beam to 30 length. In addition, the bottom is almost flat. As in her build it has been found convenient to dispense with cross-pieces, some means are required to preserve the rigidity of the whole structure amid the buffetings of a tempest. To achieve this, and also to serve the purposes of light ballast, Mr. Peake fills the space between the boat's bottom and the water-tight deck (BB) with blocks, tightly wedged together, of cork and light hard wood, D, D. These would form a false bottom, were a rent made in the outer covering, and, by their comparative weight, counteract in some degree the top-heaviness induced by the air-vessels, which are entirely above the water-line (H). This arrangement would be insufficient to maintain the equilibrium of the

boat, however, and especially under sail, so Mr. Peake has added a heavy iron keel (E) of from 4 to 8 cwt., which effectually keeps the boat straight. Some builders object to this iron ballast: the Liverpool and Norfolk boats take out their plugs, and preferably admit water until steadiness is secured; but Mr. Peake has an additional object in view—that of causing the boat to immediately right itself if turned upside down, as the best boats sometimes will be in heavy gales. It will be noticed that the ends of the boat rise above the center 1½ to 2 feet. This, for one thing, facilitates turning, as the pivot on which her weight rests is shortened; for another, if she capsizes and is thrown bottom up, these raised caissons are sufficient to sustain her by their buoyancy. So long, then, as she floats precisely in an inverted state, she will be steady; but the slightest motion to either side—which, of course, in practice ensues instantly—throws the heavy keel off the perpendicular, in which its center of gravity was exactly over the line between bow and stern, and the boat must immediately right itself. There is a covered trough over the keel to contain the tackle, sails, etc., when not in use; in service, it is also useful to receive any water that may penetrate among the cork and wooden chocks beneath the water-tight deck: this leakage is at times considerable when the outer skin of the boat has sustained damage. The trough may be fitted with a small hand-pump, to enable one of the sitters to clear it out when necessary.

Perhaps the most beautiful contrivance in the life-boat is that for discharging the water which she ships. This consists of 6 relieving tubes, G, each 6 in. in diameter, passing through the deck, B, the ballast, D, and the bottom. The tubes, which are near the center of the boat, 3 on each side, have at the bottom a valve opening outwards. As the deck, B, is always above the water-level, any water in the boat necessarily flows out through these tubes, so that if a wave bursts over her, and completely fills the boat, the relieving tubes free her, and she is empty again in a few minutes. The greater the height of water within, the faster will it run out. The advantages of the life-boat may be thus summed up. The air-chambers and the light ballast render sinking impossible; the keel nearly prevents capsizing, and rectifies it, if it does happen; while the relieving tubes effectually clear off any water that finds its way within. With such precautions, the safety of the crew appears almost assured, and, in fact, loss of life in a life-boat is a very rare occurrence.

The boat is kept on a truck—of considerable strength, as the life-boat weighs two tons—close to the beach, and is drawn to the water's edge when required; the crew are trained to their work, and, it need not be added, are among the hardiest of seamen. Ordinary life-boats are rowed by 8 or 12 oars (of the best fir) double banked; but for small stations, where it would be difficult to collect so many men at short notice, smaller boats are made, rowing six oars single banked.

The importance of the life-boat in saving life can scarcely be over-estimated. Hundreds of vessels have their crews rescued through its use every year; and as the national life-boat institution obtains funds, this invention is being gradually extended all round the coast of the United Kingdom, while foreign nations have not been remiss in thus protecting their shores.

The *Royal National Life-boat Institution*, after an unrecognized existence for several years, was formally incorporated in 1824. Its objects are to provide and maintain in efficient working order life-boats of the most perfect description on all parts of the coast; to provide, through the instrumentality of local committees, for their proper management, and the occasional exercise of their crews; to bestow pecuniary rewards on all who risk their lives in saving, or attempting to save, life on the coast, whether by means of its own or other boats, and honorary rewards, in the form of medals, to all who display unwonted heroism in the noble work. It is supported entirely by voluntary contributions. It saves about 900 lives annually, and is therefore eminently worthy of support. In 1875 it expended £36,136 on life-boat establishments, pecuniary rewards (£3,289), etc. The society has now a fleet of 256 life-boats stationed all round our shores. The coxswains of the boats alone are paid at the rate of about £8 a year. The members of the crew are paid for each service performed. From its formation up to the end of 1875, the society was instrumental in saving 23,789 lives, and gave rewards in cash to the extent of £48,000, besides 92 gold and 871 silver medals.

The size of a common life-boat renders it inconvenient for stowage on shipboard. To obviate this, the rev. E. L. Berthon, of Fareham, invented a collapsing boat, which is readily expanded, possesses great strength, and at the same time occupies comparatively little space when out of use. Its sides are connected by various hinges. This boat is extensively employed for ocean steamships.

LIFE-ESTATE, in English law, is an estate or interest in real property for a life. The life may be either that of the owner or of some third party, in which latter case it is called an estate *pur autre vie*. Life-estates in lands are classed among freeholds (q.v.). The tenant for life has certain rights in regard to the uses of the estate. He is entitled to cut wood to repair fences, to burn in the house, etc. He cannot open a mine on the estate, but, if it was already opened, he is entitled to carry it on for his own profit. Life-estates are created by deed, but there are certain estates created by law, as courtesy (q.v.), dower (q.v.), tenancy in tail after possibility of issue extinct. As to Scotland, see LIFE-RENT.

LIFE-GUARDS, the two senior regiments of the mounted portion of the body-guard of the British sovereign and garrison of London. They took their origin in two troops of horse-grenadiers raised respectively in 1693 and 1702: these troops were reduced in 1783, and reformed as regiments of life-guards. Although usually employed about the court and metropolis, the life-guards are not exempt from the liability to foreign service when required, having distinguished themselves in the Peninsula and at Waterloo. The men are all six feet high and upwards, armed with sword and carbine, wear knee-boots, leather breeches, red coats, and steel helmets. They also wear steel cuirasses, the utility of which is considered very doubtful. With this unwieldy armor, they require powerful horses, which are uniformly black. The two regiments comprise 868 men, with 550 horses; their pay and personal allowances amount to about £50,000.

LIFE-INSURANCE. See INSURANCE.

LIFE MORTARS AND ROCKETS. When a life-boat is not at hand, or a raging sea and a shoal coast render its use impracticable, a distressed ship may often receive help from shore, provided the distance be not too great for the throwing of a rope. A small rope may draw a thicker, and that a hawser, and the hawser may sustain a slinging apparatus for bringing the crew on shore. For short distances, capt. Ward's *heaving-stick* has been found useful: it is a piece of stout cane 2 ft. long, loaded at one end with 2 lbs. of lead, and at the other attached to a thin line. It is whirled round vertically 2 or 3 times, and then let go; but it cannot be relied on for more than 50 yards. Kites of various kinds have been employed, but are not found to be certain enough in action. The firing by gunpowder of some kind of missile, with a line or rope attached to it, is the method which has been attended with most success. In 1791 sergt. Bell, of the royal artillery, devised a mode of firing a shot and line from a distressed ship to the shore. It was afterwards found to be more practically useful to fire from the shore to the ship. In 1807 capt. Manby invented his *life-mortar* (see MANBY). His mortar was an ordinary 5½-in. 24-pounder cohorn, fixed at a certain angle in a thick block of wood. The missile discharged from it was a shot with curved barbs, something like the flukes of an anchor, to catch hold of the rigging or bulwarks of a ship. How to fasten the shot to the rope was at first a difficulty: chains were not found to answer; but at length strips of raw-hide were found suitable. To assist in descrying the exact position of a distressed ship on a dark night, in order to aim the mortar-rope correctly, Manby used a chemical composition as a firework, which would shine out in brilliant stars when it had risen to a certain height. A third contrivance of his for replacing the shot by a shell filled with combustibles, in order to produce a light which would render the rope visible to the crew, was not so successful.

Many variations have been made in the line-throwing apparatus. Col. Boxer has recently substituted a *bolt* for the shot, with four holes at the end; fuses thrust into these holes shed a light which marks the passage of the bolt through the air. Trengrove's rocket-apparatus, invented in 1821, consisted of an ordinary 8-oz. sky-rocket (see ROCKET). Certain practical difficulties, however, affected it, and it did not come much into use. In 1832 Dennett's apparatus was invented. It nearly resembled the old sky-rocket, but with an iron case instead of a paper one, and a pole 8 ft. long instead of a mere stick; it weighed 23 lbs., was propelled by 9 lbs. of composition, and had a range of 250 yards. A ship's crew having been saved by the aid of this rocket at Bembridge, in the isle of Wight, the board of customs caused many of the coastguard stations to be supplied with the apparatus in 1834. Carte's apparatus, brought forward in 1842, depended on the use of a Congreve rocket (see ROCKET) instead of an ordinary sky-rocket. It does not appear that this apparatus was ever adopted by the authorities. Mr. Dennett next sought to improve the power of his apparatus, by placing two rockets side by side, attached to the same stick; and it certainly did increase the range to 400 yards; but as the simultaneous and equal action of the rockets could not be always insured, the scheme was abandoned. Col. Delvigne, of the French army, invented a *life-arrow*, to be fired from an ordinary musket. It is a stick of mahogany, shaped something like a billiard-cue; the thicker end presses on the powder; while the thinner end, loaded with lead, is fitted with loops of string; a line or thin rope is attached to the loops, and the thin end of the stick projects beyond the barrel. The jerk, when the arrow or stick is fired, causes the loops to run down the stick to the thick end; this action has an effect like that of a spring, preventing the stick from darting forward so suddenly as to snap the line. The apparatus will send an arrow of 18 oz. to a distance of 80 yards, with a mackerel line attached. Another French contrivance, Tremblay's rocket with a barbed head, was soon adopted for the emperor's yacht; but as it is to be fired from the ship to the shore, it partakes of the same defects as sergt. Bell's original invention.

The most effective apparatus yet invented is col. Boxer's. Finding that Dennett's parallel rockets on one stick do not work well, he succeeded after many trials in a mode of placing two rockets in one tube, one behind the other. The head is of hard wood; there is a wrought-iron case, with a partition between the two rockets. When fired, the foremost rocket carries the case and the attached line to its maximum distance, and the rearmost rocket then gives these a further impetus. The effect is found to be greater than if the two rockets were placed side by side, and also greater than if the quantity of composition for the two rockets were made up into one of larger size. The rocket is

fired from a triangular stand, and is lighted by fuse, port-fire, or percussion-tube; the elevation is determined by a quadrant or some similar instrument.

The lines used with these several projectiles have varied greatly; but the best is found to be Italian hemp, spun loosely. It is very elastic, and when thick enough for the purpose, 500 yards weigh 46 lbs. In Boxer's rocket, the line passes through the tail of the stick, then through the head, where it is tied in a knot, with India-rubber washers or buffers to lessen the jerk. The line is carefully wound on a reel, or coiled in a tub, or faked in a box provided with pins ranged round the interior—to enable the line to run out quickly without kinking or entangling. Dennett's faking box for this purpose is the one now generally adopted.

Life-belts, jackets, and buoys of various kinds are used, made of cork, inflated India-rubber, etc.; but one apparatus now employed in conjunction with the life-rockets is known by the curious name of *petticoat-breeches*, or more simply, *sling life-buoy*. It is not strictly either a belt or a buoy, but a garment in which a man may be slung clear out of the water. When a rocket has been fired, and a line has reached the distressed ship, signals are exchanged between the ship and the shore; a thicker rope is pulled over to the ship by means of the line, and a hawser by means of the rope. When all is stretched taut, by fastening to the masts, etc., articles can be slung and drawn to and fro. The petticoat-breeches, invented by lieut. Kisbee, consists of a circular cork life-buoy forming the top ring of a pair of canvas breeches; one of these is hauled over from the shore to the ship; a man gets into it, his legs protruding below the breeches, and his armpits resting on the buoy; and he is hauled ashore by block-tackle. The crew of a wrecked ship can thus one by one be relieved. To prevent losing the hawser and other apparatus, when the last man has left the ship, an apparatus called a hawser-cutter is used, working *in* the ship, but worked *from* the shore. Other apparatus will be found noticed in LIFE-PRESERVERS.

After the destruction of the *Northfleet* in 1873, off Dungeness, an exhibition was organized at the London tavern, to which the inventors of new life-saving appliances were invited to contribute. Among the apparatus were Hurst's *life-raft*, consisting of a double pontoon, bridged over, stowed outside a ship, and lowered by simply cutting the lashings; Christie's *life-raft*, a large rectangular framework, rendered buoyant by numerous air-tight spaces, some of which are available for stowing water and provisions; and Parratt's *tubular life-raft*, composed of cylindrical air-bags made of painted canvas, supporting a flooring of sail-cloth and netting, and rendered rigid by poles fixed in various directions. Many other novelties were displayed at the London tavern, and also at a similar collection in the annual international exhibition, in the forms of life-boats, rafts, garments, belts, buoys, etc. Since then, nothing new and important has been introduced in connection with life mortars and rockets or their appendages.

LIFE-PRESERVERS, inventions for the preservation of life in cases of fire or shipwreck. The fire life-preservers will be found treated of under FIRE-ESCAPES. The other class includes the various contrivances for preserving the buoyancy of the human body, and for reaching the shore. Of these, the readiest and most effective are empty water-casks, well bunged-up, and with ropes attached to them to hold on by. It has been found that a 36-gal. cask so prepared can support 10 men conveniently, in tolerably smooth water. Cook's and Rodger's patent life-rafts consist of square frames buoyed up by a cask at each corner. Among foreign nations, frames of bamboo, and inflated goat and seal skins, have been long employed as life-preservers; and in China, it is customary for those living on the banks of the canals to tie gourds to their children, to buoy them up in case of their falling into the water. Since the introduction of cork, jackets and belts of that material in immense variety have been patented. It has been calculated that one pound of cork is amply sufficient to support a man of ordinary size and make. A few years ago, on the invention of india-rubber cloth, inflated belts of this material were made, and found to be superior in buoyancy to the cork belt, besides, when emptied of air, being very portable. They are, however, much more liable to damage by being punctured or torn, or to decay by being put away while damp. Some of these defects are remedied by having the interior of the belt divided into several compartments; so that, when one is damaged, the remainder may still suffice. Various forms of inflated mattresses, pillows, etc., have been made on the same principle, and been found very effective; one shown at the great exhibition of 1851 having sustained 96 lbs. for five days without injury. But the favorite life-buoy among sailors is composed of slices of cork neatly and compactly arranged, so as to form a buoyant zone of about 30 or 32 in. in diameter, 6 in width, and 4 in thickness. It consequently contains about 12 lbs. of cork, and is generally covered with painted canvas to add to its strength and protect it from the injurious action of the water. A buoy so constructed can sustain 6 persons, and it is generally furnished with a *life-line* (a cord running round the outside of the buoy and fastened to it at 4 points) to afford a more convenient hold. This life-preserver is found on board all vessels. See LIFE MORTARS AND ROCKETS.

LIFE-RAFTS, structures made to serve the purposes of life-boats when the latter are lacking. They may be made of various materials, such as are at hand. Logs, boards, stools, broken timbers, bound together with ropes or cords, or even the bark of

trees when ropes cannot be found, are susceptible of being formed into rafts which may be managed by resolute and experienced men in the saving of life from a wrecked ship. But apparatus is sometimes provided for the purpose of forming rafts to be used in emergencies. A number of cork life-preservers or inflated bags covered with canvas, and divided into two sections with a space between, may be used. Mr. H. B. Mountain has devised a raft in which a water-proof canvas sack has its edges secured along the centers of two mattresses so as to provide an open chamber between them in which persons may be seated. It has been attempted to construct a vessel in such a way as to have cabins or structures removable, so that they may be floated away in case of wreck, but all such ingenious devices are probably much less useful and manageable than life-boats, which can be as easily provided.

LIFE-RENT, in Scotch law, means a right to use a heritable estate for life, the person enjoying it being called a life-renter. The rights of a life-renter nearly resemble, though they are not identical with, those of a tenant for life in England. See LIFE-ESTATE.

LIFE-ROCKET DEPARTMENT, or, rather, that branch of the marine department of the board of trade which has the management of life-rockets, mortars, lines, buoys, and belts, divides with the national life-boat institution the labors connected with the prevention of shipwreck, and the rescue of shipwrecked persons. This has been the arrangement since 1855. Until that year the life-mortars in use were partly under the control of the admiralty, partly under the board of customs, partly under the institution just named, and partly belonging to private individuals. The merchant shipping act, passed in 1854, and put in force in the following year, placed the whole under a different organization.

To work out properly the rocket and life-saving system, a topographical organization is in the first instance adopted. The coasts of the United Kingdom are classified into 59 coast-guard divisions or wreck-registrars' districts; and the coast-guard inspector of each division or district has control over all the rockets, mortars, buoys, belts, and lines kept at the various seaside stations in his district. There were in 1874 about 300 such stations; some supplied with mortars, some with rockets as well as mortars, but the greater number with rockets only. Most of the mortars are Boxer's improvement on Manby's; and most of the rockets are Boxer's improvement on Dennett's. Boxer's rockets, found more effective than mortars, are made at the royal laboratory at Woolwich, and are supplied by the war department to the stations, on requisition from the board of trade; as are likewise mortar-shot and shells, fuses, portfires, signal-lights, gunpowder, etc. At each station is kept a cart, expressly made to contain all the requisites for the rocket apparatus, ready packed. Eighteen rockets are supplied with each apparatus; and a new supply is obtained before these are exhausted. Between 1874 and 1880, the system has extended year by year in the number of stations and of men; but while details of organization have changed, no new principle has been introduced. Simpler apparatus, consisting of life-belts and life-lines, is kept at a much greater number of stations. The system is worked by the coast-guard, the men being paid for periodical drilling, and for regular service. Special services are rewarded with gifts of money, medals, etc.

LIFE SAVING SERVICE. The first instance on record of a combined public effort in the direction of life-saving is that of the national life-boat association, in England, founded in 1824 under the name of the royal national association for the preservation of life from shipwreck. But as early as 1785, when the first patent was granted for a life-boat, the subject was attracting general attention; and a second boat, invented four years later, is said to have saved nearly 300 lives from vessels wrecked near the mouth of the Tynemouth haven, during the following fifteen years. The life-boat association was established "to grant funds for making life-boats, boat-houses, and life-buoys; to assist in training boatmen and coast-guardsmen to aid ships in distress; to interchange the fullest information, with corporate bodies and local committees, concerning life-saving appliances; and to reward by money, medals, and votes of thanks, those who might render aid to ships in distress, or to persons escaping from such ships." Between 1824 and 1877 this institution saved 25,435 lives: in 1876 it had 2,541 life-boats. But this association had been already indirectly preceded in the United States in the same direction, through the application of the machinery of the Massachusetts humane society to live-saving, as early as 1786. This organization, formed for general benevolent purposes, and incorporated 1791, devoted attention to the dangers of the coast of Massachusetts and to the succor of shipwrecked seamen and others, by erecting huts for their shelter on specially exposed portions, the first of these having been set up on Lovell's island, near Boston. The first life-boat station of the society was established at Cohasset in 1807, and was followed by the erection of a number of others. This movement attracted the attention of the government, which in 1847 appropriated $5,000 "for furnishing the light-houses on the Atlantic coast with the means of rendering assistance to shipwrecked mariners." In 1855 a second appropriation, of $10,000, was made by congress; in 1857, one of $10,000; and in 1870, one of $15,000. This society is still in active service, having 78 stations. Other societies, designed to aid in the protection and safety of life, were organized from time to time in different localities, but accomplished little or nothing, excepting the live-saving benevolent association of New York, founded in 1849, and still in operation, but whose work has generally been in other directions from

that under consideration. In the meantime the U. S. government had frequently had the life-saving question under consideration. As early as 1807 an effort was made to organize a coast survey, but it was unsuccessful; and it was not until 1832 that this most important department of the government was finally established; being followed by the organization of the lake survey in the hands of the engineer corps of the U. S. army. In 1848 congress appropriated $10,000 to provide surf-boats and organize a life-saving service for the coast of New Jersey. With this sum eight buildings, suitably appointed, were erected; and when, in 1849, congress appropriated $20,000 for the general purpose, a similar number of buildings was erected on the coast of Long island, and six additional ones on that of New Jersey. In 1850, $20,000 more, appropriated by congress, enabled the establishment of stations at other points along the coast of the Atlantic and the gulf, provided with life-boats and other material. In 1852 the reformation of the light-house system gave a great impetus to the movement towards a suitable life-saving service; a system which now operates 1336 lights on the sea-coast and inland shores, besides fog-signals, buoys, and other machinery. In the two years following 1852 congress appropriated $42,500 to the purposes of life-saving, and the service, while being continued along the sea-coast, was also extended to the great lakes. In 1854 a law was passed by congress which increased the efficiency of this service, and from that time slight improvements continued to be made. But it was not until 1871 that the present system may be said to have been fairly organized. On April 20 in that year, congress appropriated $200,000, and the service was reorganized, under the general direction of Mr. Sumner I. Kimball, the present (1881) superintendent. New stations were appointed and provided; the efficiency of the *personnel* of the service was improved; and a suitable commission decided upon the selection of appliances for life-saving, which were adopted and procured. In 1873 the limits of this service were broadened, the sum of $100,000 being appropriated by congress for this purpose. Finally, by the act of June 20, 1874, congress perfected its work. This act authorized the arrangement of the life-saving stations into complete stations, life-boat stations, and houses of refuge; created new districts with salaried officials; established a system of honors in the bestowal of medals; and arranged for the tabular collection of statistics displaying the efficiency of the service, and directing attention to places requiring protection at its hands. The storm-signal department of the signal service was now connected with the life-saving stations, through the use of an appropriation by congress of $30,000 specifically for that purpose. The record of this season showed how admirably the service had been adapted to the purpose for which it had been organized: 1165 lives were saved on the three coasts covered by its operations, while only two were lost. The years following were marked by constant and marked improvement in the scope and the working of the service. A valuable code of signals to enable vessels in danger to communicate with the stations was adopted in 1878; a line of telegraph between capes Henry and Hatteras, and in the vicinity of the stations on the North Carolina coast, connecting with the head-quarters of the signal service in Washington, was applied to the uses of the life-saving service; and preparations were made which resulted in the adaptation of a system of telephones to the same purpose at twelve of the stations on that coast. The act of congress of June 18, 1878, organized the life-saving service into a distinct department; it having been previously associated with the revenue marine. This act also extended the annual term of service of the crews, doubled the pay of station-keepers, and authorized compensation for the voluntary life-boat service which had been established on the lakes.—The scene of the labors of the life-saving service covered, in 1871–72, the coast of Long island and New Jersey; the seasons of 1872–74, that of cape Cod in addition to these; the season of 1874–75, the coasts of New England, Long island, New Jersey, and the coast from cape Henry to cape Hatteras; season of 1875–76, coasts of New England, Long island, New Jersey, coast from cape Henlopen to cape Charles, and that from cape Henry to cape Hatteras; season of 1876–77, all the foregoing, with the addition of Florida and the lake coast; season of 1877–78, the coast of Maine, New Hampshire, Massachusetts, Rhode island and Long island, New Jersey, cape Henlopen to cape Charles, cape Henry to cape Hatteras, eastern coast of Florida, lake coast, and Pacific coast; 1878–79, same as the last. Following is a general summary of disasters which have occurred within the scope of live-saving operations from Nov. 1, 1871 (date of introduction of present system), to close of fiscal year ending June 30, 1879:

Total number of disasters	797
Total value of vessels	$10,722,733
Total value of cargoes	5,923,294
Total value of property saved	9,510,408
Total value of property lost	7,099,619
Total number of persons on vessels	8,392
Total number of persons saved	8,030
Total number of lives lost	362
Total number of persons sheltered	1,753
Total number of day's shelter afforded	4,790

Of the number of lives lost, 183 were at the disasters to the U. S. steamer *Huron*, Nov. 24, 1877, and that of the steamer *Metropolis* Jan. 29, 1878.—At the close of the fiscal year

ending June 30, 1878, there were 12 life-saving districts, covering 173 stations; 981 surfmen employed; net expenditures for the year $363,674.72; balance of appropriations unexpended, $30,017.28. The *personnel* of the service included one general superintendent, Sumner I. Kimball; one assistant general superintendent, William D. O'Connor; one inspector of life-saving stations, capt. James H. Merryman; two superintendents of construction of life-saving stations, capt. John McGowan, capt. James H. Merryman; 12 assistant inspectors, 2 lieutenants U. S. revenue marine on special duty, 12 district superintendents, 1 assistant district superintendent.

LIFTS, ropes on shipboard for raising or lowering and maintaining in position the yards. They pass from the deck over pulleys at the mast-head, and thence to near the extremities of the yard. The lift bears the designation of the yard to which it is attached, as *fore-lift*, *maintop-gallant-lift*, etc. See RIGGING.

LIGAMENTS are cords, bands, or membranous expansions of white fibrous tissue, which play an extremely important part in the mechanism of joints, seeing that they pass in fixed directions from one bone to another, and serve to limit some movements of a joint, while they freely allow others.

Todd and Bowman, in their *Physiological Anatomy*, arrange ligaments in three classes: 1. *Funicular*, rounded cords, such as the external lateral ligament of the knee-joint, the perpendicular ligament of the ankle-joint, etc.; 2. *Fascicular*, flattened bands, more or less expanded, such as the lateral ligaments of the elbow-joint, and the great majority of ligaments in the body; 3. *Capsular*, which are barrel-shaped expansions attached by their two ends to the two bones entering into the formation of the joint, which they completely but loosely invest: they constitute one of the chief characters of the ball-and-socket joint, and occur in the shoulder and hip joints. See JOINTS.

LIGAMENTS (*ante*). See SKELETON.

LIGAN. See FLOTSAM, *ante*.

LIGATU'RA, an Italian term in music, meaning binding, frequently marked by a slur, thus ⁀, which is placed over certain notes for the purpose of showing that they are to be blended together; if in vocal music, that they are to be sung with one breath; also used in instrumental music, to mark the phrasing.

LIGATURE, the term applied, in surgery, to the thread tied round a blood-vessel to stop bleeding. The ligatures most commonly used consist of strong hempen or silk threads; but catgut, horsehair, etc., have been employed by some surgeons. A ligature should be tied round an artery with sufficient tightness to cut through its middle and internal walls. Although the operation of tying arteries was clearly known to Rufus of Ephesus, who flourished in the time of Trajan, it subsequently fell into desuetude, till it was rediscovered by Ambrose Paré, in the 16th century.

LIGATURE (*ante*). The ligature had been partially applied by the Roman surgeons, but it fell into disuse during the dark ages, and was not revived till 1536–37, when the celebrated Ambroise Paré (q.v.) introduced it while in Italy with the army of marshal René de Mont-Jean. This example did not, however, suffice to make the practice general, and it was long before it was introduced into England, where, as late as 1761, it needed advocates in cases of wounded arteries. Thirty years after this, John Hunter employed the ligature in the treatment of aneurism in a new way, viz., by tying the artery at a considerable distance from the aneurismal sack, and where it was in a healthy condition. But this great improvement was coldly received.

Ligatures are applied chiefly: 1. For removing tumors of various kinds, such as hemorrhoids of the rectum, and fibrous, fleshy, and erectile tumors in various parts; 2. For arresting hemorrhage in arteries, either at the time of an amputation, or any operation in which an artery is divided, or when an artery is wounded by accident; 3. For arresting the flow of blood, to diminish either the *supply* of blood going to a part, or the *flow* of blood in an aneurismal or otherwise weakened artery.

Ligatures are of various materials, as linen thread or twine, silk, animal membrane, such as the gut of the silk-worm, deer-skin, catgut, gold, silver, platinum, or lead wire. The principles indicating the use of these various materials vary with circumstances. It is often desirable, instead of keeping a wound open, to close it immediately, in which case the ligature must be of such material that it can be left in the wound and allow of the flesh to heal over it. Linen thread or silk will not then answer, because of the irritation they would create. Fine gold and silver wire has been successfully used in such cases, the ends of the ligature being cut off short. After a while the small piece of ligature will make its way to the surface, after having fulfilled its office, or it may become covered with a cellular capsule. The older surgeons used animal membranes, but with indifferent success. Wardrop used the gut of the silk-worm, and catgut was employed by sir Astley Cooper, with a view to absorption of the ligature. In one patient of Cooper's, 80 years of age, the wound healed in four days; another in twenty, and it was supposed that the material was absorbed. Other surgeons who attempted to imitate the process failed; the catgut was often found too weak, or wanting in firmness; and sir Astley himself, after having some unsuccessful cases, abandoned the use of this material and returned to that of the ordinary hempen thread. The wire ligature now so much used, and which in many modern operations is absolutely necessary for suc-

cess, is an American invention. It originated with Drs. Physick and Levert, who performed several operations with threads of gold, silver, platinum, and lead. When the ends of the ligature were cut off close to the vessels they usually became imbedded in a cellular capsule, and did not occasion irritation. But this practice also fell into disuse, to be revived in recent times with certain modifications which render it almost one of the necessary adjuncts of modern surgery. The use of the catgut ligature has also recently been revived with the very important improvement of treating it with a solution of carbolic acid.

The immediate effects on an artery of a ligature applied with sufficient force are the division of the internal and middle coats and the constriction of the outer one. See ARTERY, *ante*. An examination of the vessel a few days after will reveal the formation of a pyramidal coagulum, composed of plastic matter at its base and a fibrinous clot at its apex. The vessel at this point will also be surrounded by coagulable lymph. At the expiration of two or three months the end of the artery will be converted into a fibro-cellular cord as far up as the first branch above the ligature.

The principles involved in the application of ligatures to wounded arteries may be briefly stated in two axioms: 1. Cut directly down on the wounded part, and tie the vessel there; 2. Apply the ligature to both ends of the wounded vessel if it be divided, or, if it be only punctured, to both distal and proximal sides of the puncture; or, in other words, in either case tie the artery in two places. The principles are: if we wish to get at both ends of the vessel conveniently, we should cut directly down to the point of injury; we tie both ends of the divided vessel, or on both sides of the wound in it, because if the proximal side (that towards the heart) alone is tied, vascular connections which may exist between the distal portion of the artery and other vessels may cause recurrent hemorrhage. If it does not take place soon after the application in the form of arterial blood, venous blood will be likely to make its appearance in the course of two or three days.

At first ligatures were applied to arteries, in operations for aneurism, near the sack, and on the proximal side (that nearest the heart). The vessel so near the aneurism rarely being healthy, generally soon gave way, and the operation proved fatal. John Hunter, as above mentioned, made the improvement of tying at a distance from the tumor, and also on the proximal side, and that is still the most favorable position; but Brasdor afterwards conceived the idea of tying on the distal side, because the flow of blood may be arrested in this way, and consolidation effected in the usual way by the laminated deposit of fibrine. The proximal operation is, however, preferable when anatomical difficulties do not prevent or greatly interfere. The immediate object of applying a ligature for aneurism is to cause consolidation in the parts, thereby producing a condition which will prevent the rupture of the vessel by the heart's action. This consolidation it produces by producing coagulation of blood within the vessel, and a deposit of plastic lymph around it. In successful cases, after consolidation and formation of tissue have advanced sufficiently, the tissues give way which are included in the ligature, and this may be easily removed. The success of the operation depends upon the re-establishment of the circulation in those parts which are supplied by that portion of the vessel which is severed from its connection with the heart. This is effected by nature in establishing anastomosing circulation with collateral branches. The bleeding which may result after the ligature of an artery is called secondary hemorrhage, and may arise from the giving way of the coats of the vessel, because it may not have been properly tied, or because the condition of the patient is not such as to allow of natural coagulation of the blood.

The great operations in arterial ligature are the tying of the subclavian, innominate, carotid, and iliac arteries. See CIRCULATION, *ante*. The axillary, brachial, femoral, and smaller arteries of the limbs are frequently tied for various reasons; but sometimes success is rendered difficult, even in these minor operations, from liability to gangrene of the limb, in consequence of the deprivation of circulation; and the operation is justified where an aneurism has burst or a ligature of an already tied artery has given way. Life is sometimes prolonged for many hours and even several days, which, under some circumstances, is a matter of great importance. The ligation of arteries often demands the greatest dexterity, skill, and surgical knowledge. Tissues which lie at considerable depths require to be divided by the knife; much of the work has to be done without the aid of the sight.

The abdominal aorta has been tied in seven instances. The first operation was performed by the great English surgeon, sir Astley Cooper, in 1817, the patient surviving 48 hours. The next was by James of Exeter, in 1829, the patient living only a few hours afterwards. Murray, at the cape of Good Hope, in 1834, performed the next operation, which terminated fatally in 24 hours. Monteiro of Rio Janeiro, in 1842, had the most remarkable prolongation of life under this operation, the patient living 10 days. South of London performed the fifth operation in 1856, with 43 hours' lease of life. McGuire of Richmond, U. S. A., performed the sixth operation in 1868, the patient surviving 12 hours. Stokes of Dublin tied the artery in the seventh instance in 1869, with a fatal issue in 13 hours.

The common iliac artery, according to statistics of Dr. Stephen Smith of New York, has been ligated 40 times, with 10 recoveries. Of 14 cases in which this vessel

was tied for hemorrhage, 13 proved fatal. The majority of the recoveries took place after ligature for aneurism, which constituted about one-half of the cases. The first time a ligature was ever placed around this artery in the living subject was by Dr. William Gibson of Philadelphia, in 1812, in a case of gun-shot wound. The patient died on the 13th day of peritonitis and secondary hemorrhage. It was tied in 1827 by Dr. Valentine Mott, with a successful result. The operation lasted less than one hour. It was performed on Mar. 15, and the ligature was removed on April 3 following. On May 20 the patient made a journey of 25 miles. *The internal iliac artery* was ligatured for the first time in 1812 by Stevens of St. Croix, since which it has been tied 19 times, in 6 cases with success—viz., by Arndt, Dr. White of Hudson, N. Y. (on a tailor 60 years old), Valentine Mott, Syme, Morton, and Gallozzi. *The external iliac artery* was first tied by the celebrated Dr. Abernethy of London, in 1796, in a case of femoral aneurism (Power). During the following 50 years the operation was performed in 100 recorded cases for inguinal aneurism (Norris), with a result of 73 cures and 27 deaths. In one remarkable case both external iliacs were tied, with a successful result, by Tait (Erichsen). In 1814 sir Astley Cooper had performed the operation seven times, with success in four cases. In 1860 it had been tied for aneurism of the femoral artery 43 times (Power).

Ligature of the innominata, or brachio-cephalic artery.—From a table in an essay awarded the second prize by the American medical association in 1878 to Dr. John A. Wyeth of the university of Louisville, Ky., there are recorded 16 cases of ligature of this artery, the largest of the branches of the aorta, and which divides into the right subclavian and right common carotid. One of these operations was attended with success, that by Dr. A. W. Smyth of New Orleans, in 1864, in a case of aneurism of the subclavian artery. The following note is taken from the table: "Aneurism resulted from violent stretching of the arm; three months later innominate and carotid were tied simultaneously; did well until the 14th day, when hemorrhage (16 oz.) occurred, which was controlled by compress; 15th and 16th days, continued slight hemorrhage; 17th day, wound was filled with small shot; 51st day, terrible hemorrhage; 54th day, vertebral artery tied; 55th day, shot removed from wound; patient continued to do well, and recovered." The man died 10 years afterwards of hemorrhage from the original sack of the aneurism. The first ligation of this artery was by Valentine Mott, in 1818, and marked an era in surgery. The patient survived till the 26th day. Four years later Von Graefe of Berlin performed the operation, and the patient lived till the 67th day.

Ligature of the subclavian artery.—In a report made to the American medical association in 1867 by Drs. Willard Parker, George W. Norris, J. H. Armsby, and William H. Mussey, there are tabulated 157 well-authenticated cases. The first operation was performed by Keate, in 1800, for traumatic axillary aneurism, four months after the injury. The patient recovered. The next operation was by Ramsden, in 1809, also for axillary aneurism. The patient died on the fifth day. Four other fatal operations followed, till, in 1815, Chamberlayne was successful. The eighth case was by Dr. Wright Post of New York, in 1817, which also terminated favorably, the patient recovering. The ninth and tenth cases were by the celebrated French surgeon, Dupuytren, both in 1819, one being successful and the other fatal. These early and pioneer operations are surrounded with great interest. They were careful steps in the art of surgery, taken by great men. The second American operation for ligature of the subclavian artery was by Valentine Mott, in 1830, for axillary aneurism, and was successful. Dr. Mott's second case, in 1831, was fatal on the 18th day. The first distal ligature of the subclavian artery was by Wardrop, an English surgeon, in 1827, for aneurism of the innominata. This distal operation on arteries was conceived by Brasdor, but first carried out by Deschamps. See BRASDOR'S OPERATION, *ante*. The next operation on the distal side of the aneurism was performed by Dupuytren, in 1829, but did not result in recovery, the patient dying of exhaustion on the 7th day. There were 10 distal cases, 8 of which died. The two successful ones were by Wardrop and Heath. Between 1831 and 1844, not inclusive, ligature of the subclavian artery was performed 41 times, with 16 favorable and 25 unfavorable results. Dr. Mott's third operation for ligature of the subclavian was in 1838, and resulted in recovery. Drs. John C. Warren of Boston, Valentine Mott and A. C. Post of New York, each tied the artery with successful results in 1844, all of the patients recovering. Dr. Mott's fifth case, in 1850, was also successful, making a record of five cases of ligature of the subclavian artery, two being upon the left, the most difficult side, with only one fatal result. Dr. Willard Parker has also tied the subclavian artery five times, with but two fatal results, in one of which the patient survived till the 42d day. Of the whole 157 cases, 79 were successful and 78 fatal. The committee reported 39 additional cases, with 28 fatal results. They also remark that the subclavian artery, in its first division, has been tied 13 times without a single recovery; in its second division, 9 times, with 4 deaths; and in its third division, 174 times, with 89 deaths.

In the essay of Dr. Wyeth, above quoted, there is a tabulated collection of 286 cases of ligature of the subclavian, which he comprises in three sections: those in which the ligature was applied to the first division of the artery; those in which it was applied in the middle part of its course; and those in which the third division was the seat of operation. This report agrees with the preceding in regard to the 13 cases of

ligature in the first division of the vessel. One of these cases, that of Rossi, in 1844, possesses uncommon interest, from the fact that the autopsy showed that the only artery going to the brain which was not obliterated, and therefore capable of carrying blood, was the left vertebral, and yet the patient survived six days, dying of cerebral anæmia. In its second division, the subclavian has been ligated 13 times, with four cures, the first by Dupuytren in 1819; the second by Nichols of Norwich, England, in 1832; the third by J. C. Warren of Boston in 1844; and the fourth by T. G. Morton of Philadelphia in 1866. The subclavian has been tied in its third division, that next the axilla, in 254 cases. The first was Ramsden's case in 1809. Recovery followed in 120 cases, or nearly 50 per cent.

Ligation of the common carotid artery.—Dr. Wyeth, in an essay on the surgical anatomy and history of the common, external, and internal carotid arteries, and which was awarded the first prize by the American medical association in 1878, reports 794 cases of ligature of the common carotid artery, 18 of the internal, and 91 of the external carotid. These are collected from all parts of the world, and embrace many in military surgery furnished during the late American and European wars, the records of which, until recently, have not been accessible. The common carotid artery was first tied by Abernethy in 1803, the patient surviving 30 hours. The operation was performed six times by Dr. Gurdon Buck of New York between the years 1839 and 1857. All recovered from the operation but one; and three were cured. Five operations were performed by Dr. Detmold of New York, with four recoveries, two cures, and one checking of malignant growth for several months. Dr. Frank H. Hamilton has tied the common carotid 11 times, with 8 recoveries, one cure, and one improvement. The case of cure was for aneurism. Most of the other cases were of malignant disease, in which only temporary relief was expected. Three cases were by Dr. J. C. Hutchison of Brooklyn, two of which were cured. One of these was a wound, and the other a case of severe neuralgia, for which many teeth and portions of the alveolar process had been removed. The fatal case was one of aneurism of the innominate artery, and the patient survived till the 41st day. Five operations were by Von Langenbeck, with two recoveries, including one cure. Four were by Liston, with one temporary recovery. Three were by Dr. George McClellan of Philadelphia, one for erectile tumor of orbit, one for erectile tumor of cheek, and one for vascular fungus of the dura-mater. All were cured. There are 31 cases of ligature of the common carotid given in Dr. Wyeth's table, performed by Dr. Valentine Mott, with 26 recoveries, including 9 cures and 6 improvements. Dr. A. B. Mott, son of Valentine, has performed the operation 11 times, with 10 recoveries, including 7 cures. Nunneley has tied the artery six times for aneurism of the orbit, with five recoveries, including two cures, and one decided improvement. There are 13 cases by Dr. Willard Parker. The first, in 1848, was one of epilepsy. The patient had had a portion of skull removed by the trephine, with temporary improvement; but, the attacks recurring, the carotid was tied. The patient died of some other affection 27 years after. Of the other 12 cases, 10 recovered, including 3 cured, and 3 benefited. In four there was no benefit, but they were cases of malignant disease, which demanded interference. Pirigoff has tied the artery 12 times, with 6 recoveries, including 1 cure, but they were difficult cases; three for aneurism of the innominata, others for shot-wounds and tumors. Preston, in India, tied the artery six times, with recovery in all. One was for epilepsy of 5 years' standing. There was no return of the attack for 5 months, and much improvement of the general health. Dr. Sands of New York has ligated the artery 8 times, with 5 recoveries, including 2 cures, one of which was in an operation for the removal of the lower jaw-bone. Syme has tied the artery 6 times, with 4 cures. Dr. John C. Warren of Boston tied the artery 8 times, with 8 recoveries, including 3 cures. The first operation was in 1827, for aneurism of 4 years' standing, and was successful. Dr. James R. Wood of New York has tied the artery 9 times, with 6 recoveries, including 2 cures and 2 improvements. The other cases were of a malignant nature, and incurable. Of 27 cases tabulated by Erichsen of ligature of both right and left common carotids, 19 recovered. There was an interval between the two operations of a few months; in one case of a year; and in one case of 38 years; the right carotid having been tied by Dupuytren in 1819, the left by Robert in 1857, the latter operation being soon followed by death.

In regard to the effects upon the brain of ligation of the carotids, it may be remarked that ligature of one carotid causes cerebral disturbance in more than one-fourth of the cases, and of these more than one-half are fatal. The tying of both carotids, with an interval of several days or weeks, appears not to cause more cerebral disturbance than when but one is tied. The cerebral symptoms caused by ligature of one or both carotids sometimes depend upon a diminished supply of blood, and consist of convulsive movements, syncope, and paralysis. In other cases there will be increased pressure upon the brain, followed by drowsiness, stupor, coma, and apoplexy. Inflammation is also one of the effects, usually coming on in a few hours after the operation. The lungs are also frequently affected after ligation of the carotids, as has been specially pointed out by Jobert and Miller, becoming congested, with a tendency to a low form of inflammation, in consequence of deficient innervation.

LIGHT is the subject of the science of optics (q.v.). We here just notice its principal phenomena, and the hypotheses advanced to explain them. Every one knows that light

diverges from a luminous center in all directions, and that its transmission in any direction is *straight*. It travels with great velocity, which has been ascertained, by observations on the eclipses of Jupiter's satellites and other means, to be 186,000 miles per second. Shadows (q.v.) are a result of its straight transmission; and it follows from its diverging in all directions from a luminous center that its intensity diminishes inversely as the square of the distance from the center. When it falls on the surfaces of bodies, it is reflected from them regularly or irregularly, totally or partially, or is partly or wholly transmitted or refracted through them. The phenomena of the reflection and of the refraction of light are treated of respectively under the heads catoptrics (q.v.) and dioptrics (q.v.). The facts of observation on which catoptrics is founded are two: 1. In the reflection of light, the incident ray, the normal to the surface, and the reflected ray are in one plane; 2. The angle of reflection is equal to the angle of incidence. Similar to these are the physical laws on which dioptrics is founded. When a ray of homogeneous light is incident on a refracting surface, 1. The incident and refracted ray lie in the same plane as the normal at the point of incidence, and on opposite sides of it; 2. The sine of the angle of incidence, whatever that angle may be, bears to the sine of the angle of refraction a ratio dependent only on the nature of the media between which the refraction takes place, and on the nature of the light. In stating these laws, we have hinted at light being of different kinds. At one time it was not supposed that color had anything to do with light; now, there is no serious dispute but that there are lights of different colors (see CHROMATICS and SPECTRUM), with different properties, though obeying the same general laws. Among the most striking phenomena of light are those treated of under the head Polarization (q.v.). Next to these in interest are the phenomena of double refraction. See REFRACTION, DOUBLE. For an account of the chief chemical properties of light, see PHOTOGRAPHY and SPECTRUM. See also for phenomena not noticed above, the articles ABERRATION, DIFFRACTION, DISPERSION, INTERFERENCE.

Two hypotheses have been advanced to explain the different phenomena of light, viz., the theory of *emission*, or the corpuscular theory, and the theory of *vibration*, or the undulatory theory. According to the former, light is an attenuated imponderable substance, whose colors depend on the velocity of its transmission. It regards reflection as analagous to the rebounding of elastic bodies; while, to explain refraction, it assumes that there are interstices in transparent bodies, to allow of the passage of the particles of light, and that these particles are attracted by the molecules of bodies—their attraction combining with the velocity of the particles of light to cause them to deviate in their course. The undulatory theory assumes that light is propagated by the vibrations of an imponderable matter termed ether (q.v.). On this view light is somewhat similar to sound (see INTERFERENCE). Newton was the author of the former theory, and Huygens may be regarded as the author of the latter. The theories were long rivals, but now no doubt remains that the theory of undulations has triumphed over the other. Its soundness may be said to rest on similar evidence to that which we have for the theory of gravitation: it had not only satisfactorily accounted for all the phenomena of light, but it has been the means of discovering *new* phenomena. In fact, it has supplied the philosopher with the power of prescience in regard to its subject. Those who wish to study the theory may advantageously consult its popular exposition by Young (*Lectures on Natural Philosophy*, London, 1845), and Lloyd's *Wave Theory of Light* (Dublin, 1856). The mathematical theory is very fully investigated in Airy's *Mathematical Tracts*.

LIGHT. In point of law, the right to light is one of the rights incident to the ownership of land and houses. When it is claimed in such a way as to interfere with a neighbor's absolute rights, it is called in England and Ireland an easement (q.v.), and in Scotland a servitude (q.v.). In England and Ireland the right to light, as between neighbors, is qualified in this way, and forms a subject of frequent dispute in towns and populous places. If A build a house on the edge of his ground with windows looking into B's field or garden which is adjacent, B may next day, or any time within 20 years, run up a house or screen close to A's windows, and darken them all, for one has as good a right to build on his own land as the other. But if B allow A's house to stand 20 years without building, B is forever after prevented from building on his own land so as to darken A's lights, for A then acquires a prescriptive right to an easement over B's lands. In the Roman law a person was entitled not only to a servitude of light, but also of prospect; but in this country the right of prospect, or of having a fine view, is not recognized by the law, except so far that the lights, after 20 years, must not be sensibly darkened. In Scotland a servitude of light may exist in like manner, but it cannot be constituted except by special grant; whereas in England, if nothing is said, the right is acquired by prescription, or mere lapse of time. In Scotland a neighbor, B, may, after 20 years, or any distance of time, build on his own land, and darken A's windows, provided he do not act wantonly, emulously, or so as to cause a nuisance.

LIGHT (*ante*). Among the latest conclusions with regard to the velocity of light are those which are published in the *Annales de l'Observatoire de Paris*, vol. xiii., being an account by M. Cornu of the experiments made between the observatory of Paris and the tower of Montlhéry. The result of these experiments gave, for the velocity of

light, 300,400 kilometers per second. Foucault's experiments, made in 1862, placed it at 298,000 kilometers, or 185,000 miles; and the investigations made at the naval academy, Annapolis, 1879, gave a mean between these two conclusions—186,305 miles, or 299,951 kilometers.

LIGHT (*ante*). See UNDULATORY THEORY OF LIGHT, *ante*.

LIGHT, ABERRATION OF. See ABERRATION OF LIGHT, *ante*.

LIGHT, ZODIACAL. See ZODIACAL LIGHT, *ante*.

LIGHTER, a large flat-bottomed barge or boat, usually propelled or guided by two heavy oars, and used for conveying merchandise, coals, etc., between ships and portions of the shore they cannot reach by reason of their draught.

LIGHTFOOT, JOHN, one of the earlier Hebrew scholars of England, was b. in 1602 at Stoke-upon-Trent, in Staffordshire. He studied at Christ's college, Cambridge, and, after entering into orders, became chaplain to sir Rowland Cotton, who, being himself a good Hebrew scholar, inspired Lightfoot with a desire to become one also. In 1627 appeared his *Erubhim, or Miscellanies Christian and Judaical*, which were dedicated to sir Rowland, who, in 1631, presented him to the rectory of Ashley in Staffordshire. Subsequently, he removed to London, that he might have better opportunities for the prosecution of his favorite study; and in 1642 he was chosen minister of St. Bartholomew's, to the parishioners of which he dedicated his *Handful of Gleanings out of the Book of Exodus* (London, 1643). His most important work is *Horæ Hebraicæ et Talmudicæ*, etc. (Cambridge, 1648), recently re-edited by R. Gandell (4 vols., Oxford, 1859). Lightfoot was one of the assembly of divines who met at Westminster in 1643, and in the debates that took place there, betrayed a decided predilection for the Presbyterian form of church government. In the same year he was chosen master of Catharine hall, Cambridge, and in 1655 vice-chancellor of the university. At the restoration he complied with the terms of the act of uniformity. He died at Ely, Dec. 6, 1675.

LIGHTFOOT, The Rev. JOSEPH BARBER, D.D., bishop of Durham, a distinguished English scholar and theologian. Born at Liverpool in 1828, he was educated at Cambridge, obtained numerous distinctions there, and in 1857 became a tutor of Trinity. In 1861 he was made professor of divinity; in 1871, canon of St. Paul's; and in 1879, bishop of Durham. His best known works are revised texts, with introduction and notes, of St. Paul's epistles to the Galatians (4th ed. 1874), Philippians (3d ed. 1873), and Colossians (1875), and of Clement's epistles to the Corinthians. He has also written on the Gnostic heresies and on the canon of Scripture.

LIGHT-HOUSE, a building on some conspicuous point of the sea-shore, island or rock, from which a light is exhibited at night as a guide to mariners. The light-houses of the United Kingdom now number, with harbor-lights, upwards of 500 stations, and include some of the finest specimens of engineering, such as Smeaton's Eddystone, Robert Stevenson's Bell rock, Alan Stevenson's Skerryvore, and James Walker's Bishop rock. More recently, somewhat similar structures have been erected on the Wolf rock in the English channel by Mr. Douglass, and on the Duheartach rock, Argyleshire, and on the Chickens, off the isle of Man, by Messrs. D. & T. Stevenson. As information will be found under their respective heads regarding some of these interesting works, we shall restrict ourselves in the following short memoir to the most approved means of producing a powerful light for the use of the mariner.

Catoptric or Reflecting System.—All of those rays of light proceeding from the focus of a paraboloid which fall upon its surface are reflected parallel to the axis so as to form a solid beam of light. When a series of such reflectors are arranged close to each other round a cylinder in a light-house, they illuminate constantly, though not with equal intensity, the whole horizon. As the property of the parabolic reflector is to collect the rays incident upon its surface into one beam of parallel rays, it would be absolutely impossible, were the flame from which the rays proceed a mathematical point, to produce a light which would illuminate the whole of the horizon, unless there were an infinite number of reflectors. But as the radiant, instead of being a mathematical point, is a physical object, consisting of a flame of very notable size, the rays which come from the outer portion of the luminous cone proceed, after reflection, in such divergent directions as to render it practically possible to light up, though unequally, the whole horizon. The useful divergence produced in this way by a burner of one inch in diameter, with a focal distance of four inches, is in the horizontal plane about 14° 22'. The whole horizon may thus be illuminated by reflectors.

If, for the purpose of distinction, it is desired to show a *revolving* light, then several of those reflectors are placed with their axes parallel to each other on each of the faces of a four-sided frame, which is made to revolve. In such a case, the mariner sees a light only at those times when one of the faces of the frame is directed towards him, but at other times he is left in darkness. The rotation of the frame upon its axis thus produces to his eye a succession of light and dark intervals, which enables him to distinguish it from the fixed light which is constantly in view in every azimuth. The distinction of a red light is produced by using a chimney of red instead of white glass for each burner. The *flashing* or scintillating light, giving, by rapid revolutions of the

frame, flashes once every five seconds, which is one of the most striking of all the distinctions, was first introduced by the late Mr. Robert Stevenson, the engineer of the northern light-houses, in 1822, at Rhinns of Islay, in Argyleshire. The same engineer also introduced what has been called the *intermittent* light, by which a stationary frame with reflectors is instantaneously eclipsed, and is again as suddenly revealed to view by the vertical movement of opaque cylinders in front of the reflectors. The intermittent is distinguished from the revolving light, which also appears and disappears successively to the view, by the suddenness of the eclipses and of the reappearances, whereas in all revolving lights there is a gradual waxing and waning of the light. The late Mr. Wilson introduced at Troon harbor an intermittent light which was produced by a beautifully simple contrivance for suddenly lowering and raising a gas-flame. Mr. Robert Louis Stevenson has proposed an intermittent light of *unequal periods* by causing unequal sectors of a spherical mirror to revolve between the flame and a fixed dioptric apparatus (such as that shown in fig. 1). The power of the light is increased by the action of the spherical mirror, which also acts as a mask in the opposite azimuths. The number of distinctive light-house characteristics has not yet been exhausted in practice, for various other distinctions may be produced by combination of those already in use; as, for example, revolving, flashing, or intermittent lights might be made not only red and white alternately, but two red or white, with one white or red. Similar combinations could of course be employed where two lights are shown from the same or from separate towers.

Dioptric System.—Another method of bending the diverging rays proceeding from a lamp into such directions as shall be useful to the mariner is that of *refraction*. If a flame be placed in the focus of a lens of the proper form, the diverging rays will be bent parallel to each other, so as to form a single solid beam of light. M. Augustin Fresnel was the first to propose and to introduce lenticular action into light-house illumination, by the adoption of the annular or built lens, which had been suggested as a burning instrument by Buffon and Condorcet. He also, in conjunction with Arago and Mathieu, used a large lamp having four concentric wicks. In order to produce a revolving light on the lenticular or dioptric system, a different arrangement was adopted from that which we have described for the catoptric system. The large lamp was now made a fixture, and four or more annular lenses were fitted together, so as to form a frame of glass which surrounded the lamp. When this frame is made to revolve round the lamp, the mariner gets the full effect of the lens whenever its axis is pointed toward him, and this full light fades gradually into darkness as the axis of the lens passes from him. In order to operate upon those rays of light which passed above the lens, a system of *double* optical agents was employed by Fresnel. These consisted of a pyramid of lenses with mirrors placed above at the proper angle for rendering the rays passing upward parallel to those which came from the annular lens. But Fresnel did not stop here, for, in order to make the lenticular system suitable for fixed as well as revolving lights, he designed a new optical agent, to which the name of *cylindric refractor* has been given. This consisted of cylindrical lenses, which were the solids that would be generated were the middle vertical profile of an annular lens made to circulate round a vertical axis. The action of this instrument is obviously, while allowing the rays to spread naturally in the horizontal plane, to suffer refraction in the vertical plane. The effect of this instrument is, therefore, to show a light of equal intensity constantly all round the horizon, and thus to form a better and more equal light than that which was formerly produced for fixed lights by parabolic reflection. It is obvious, however, from our description that the diverging rays which were not intercepted by this cylindric hoop, or those which would have passed upward and been uselessly expended in illuminating the clouds, or downward in uselessly illuminating the light-room floor, were lost to the mariner; and in order to render these effective Fresnel ultimately adopted the use of what has been called the internal or total reflection of glass; and here it is necessary to explain that one of the great advantages of the action by glass over reflection by metal is the smaller quantity of light that it absorbs. It has been ascertained that there is a gain of nearly one-fourth (.249) by employing glass prisms instead of metallic reflectors for light-house illumination. There were, therefore, introduced above and below the cylindric refracting hoop which we have described, separate glass prisms of triangular section, the first surface of each of which refracted to a certain extent any ray of light that fell upon it, while the second surface was placed at such an angle as to reflect, by total reflection, the ray which had before been refracted by the first surface; and the last or outer surface produced another refraction, which made the rays finally pass out parallel with those refracted by the central cylindric hoop. The light falling above the cylindric hoop was thus by refractions and reflections bent downward, and that falling below was bent upward, so as to be made horizontal and parallel with that proceeding from the refracting hoop. Fig. 1 represents in vertical section this, which is the most perfect of Fresnel's inventions in light-house illumination, especially when made in pieces of the rhomboidal form, and used in connection with the diagonal framing introduced by Mr. Alan Stevenson. In the fig., *p* shows the refracting and totally reflecting prisms, and R the cylindric refractor.

From what has been stated, it will be readily seen that, in so far as regards fixed lights, which are required to illuminate *constantly* the whole of the horizon with equal

intensity, the dioptric light of Fresnel with Mr. Alan Stevenson's improvements is a perfect instrument. But the case is different as regards revolving lights, or those where the whole rays have to be concentrated into one or more beams of parallel rays. To revert to the parabolic reflector, it must be obvious that all rays which escape past the lips of the reflector, never reach the eye of the mariner, while, if we return to the dioptric revolving light of Fresnel, we find that those rays which escape past the lens are acted on by *two* agents, both of which cause loss of light by absorption. The loss occasioned by the inclined mirrors, and in passing through the pyramidal inclined lenses, was estimated by Fresnel himself at *one-half* of the whole incident rays. In order to avoid this loss of light, Mr. Thomas Stevenson proposed, in 1849, to introduce an arrangement by which the use of one of these agents is avoided, and the employment of total reflection, which had been successfully employed by Fresnel for fixed lights, was introduced with great advantage for revolving lights.

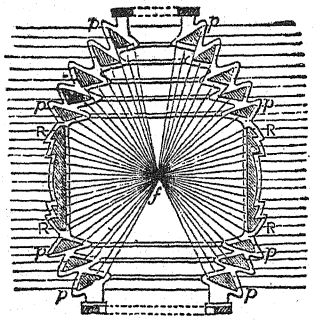


Fig. 1.

"This effect may be produced in the case of metallic reflectors by the combination of an annular lens, L (fig. 2); a parabolic conoid, *a*, truncated at its parameter, or between that and its vertex; and a portion of a spherical mirror, *b*. The lens, when at its proper focal distance from the flame, subtends the same angle from it as the outer lips of the paraboloid, so that no ray of light coming from the front of the flame can escape being intercepted either by the paraboloid or the lens. The spherical reflector occupies the place of the parabolic conoid which has been cut off behind the parameter. The flame is at once in the center of the spherical mirror, and in the common focus of the lens and paraboloid. The whole sphere of rays emanating from the flame may be regarded as divided into two hemispheres. Part of the anterior hemisphere of rays is intercepted by the lens, and made parallel by its action, while the remainder is intercepted by the paraboloidal surface, and made parallel by its action. The rays forming the posterior hemisphere fall on the spherical mirror behind the flame, and are reflected forwards again through the focus in the same lines, but in opposite directions to those in which they came, whence passing onwards they are in part refracted by the lens, and the rest are made parallel by the paraboloid. The back rays thus finally emerge horizontally in union with the light from the anterior hemisphere. This instrument, therefore, fulfills the necessary conditions, by collecting the *entire sphere of diverging rays into one beam of parallel rays without employing any unnecessary agents.*"

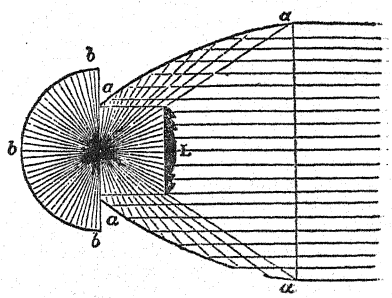

Fig. 2.

What has been just described is what Mr. Stevenson terms a *catoptric holophote*. What follows is a description of his *dioptric holophote*, in which total reflection, or the most perfect system of illumination, is adopted. The front half of the rays is operated upon by totally reflecting glass prisms, similar in section to those applied by Fresnel for fixed lights; but, instead of being curvilinear in the horizontal plane only, they are also curvilinear in the vertical plane, and thus produce, in union with an annular lens, a beam of parallel rays similar to what is effected by the parabolic mirror. The rays proceeding backwards fall upon glass prisms, which produce two total reflections upon each ray, and cause it to pass back through the flame, so as ultimately to fall in the proper direction upon the dioptric holophote in front, so that the whole of the light proceeding from the flame is thus ultimately parallelized by means of the smallest number and the best kinds of optical agents. It is a remarkable property of the spherical mirror that no ray passes *through* it, so that an observer, standing behind the instrument, perceives no light, though there is nothing between him and the flame but a screen of transparent glass.

Where the light is produced by a great central stationary burner, the apparatus assumes the form of a polygonal frame, consisting of sectors of lenses and holophotal prisms, which revolves round the flame, and each face of which produces a beam of parallel rays. Hence, when the frame revolves round the central flame, the mariner is alternately illuminated and left in darkness, according as the axis of each successive face is pointed toward him or from him. In the revolving holophotol light one agent is enabled to do the work of two agents in the revolving light of Fresnel, as total reflection, or that by which least light is lost, is substituted for metallic reflection. The dioptric holophotal system, or that by which *total reflection is used as a portion of the revolving apparatus*, was first employed on a small scale in 1850 at the Horsburg light-

house, and on the large scale in 1851 at North Ronaldshay in Orkney. Since that date this system has been all but universally introduced into Europe and America.

Azimuthal Condensing Light.—The above is a description of the general principles on which light-houses are illuminated. In placing a light in some situations, regard, however, must be had to the physical peculiarities of the localities; the following plans of Mr. Thomas Stevenson may be cited as examples. In fixed lights of the ordinary construction, the light is distributed, as already explained, equally all round the horizon, and is well adapted for a rock or island surrounded by the sea. But where it is only necessary to illuminate a narrow sound, it is obvious that the requirements are very different. On the side next the shore, no light is required at all; across the sound, a feeble light is all that is necessary, because the distance at which it has to be seen is small, owing to the narrowness of the channel; while up the sound and down the sound the sea to be illuminated is to be of greater or lesser extent, and requires a corresponding intensity. If the light were made sufficiently powerful to answer for the greater distance, it would be much too powerful for the shorter distance across the sound. Such an arrangement would occasion an unnecessary waste of oil, while the light that was cast on the landward side would be altogether useless. Fig. 3 represents (in plan) the condensing light, by which *the light proceeding from the flame is allocated in the different azimuths in proportion to the distances at which the light requires to be seen by the mariner in those azimuths.* Let us suppose that the rays marked α require to be seen at the greatest distance down the sound, and those marked β to a somewhat smaller distance up the sound. In order to strengthen those arcs, the spare light proceeding landwards, which would otherwise be lost, is intercepted by portions of holophotes, B and C, subtending spherical angles proportioned to the relative ranges and angular spaces of the arcs α and β. The portions of light thus intercepted are parallelized by the holophotes, and fall upon *straight* prisms *a*, *a*, and *b*, *b*, respectively, which again refract them in the horizontal plane only; and, after passing through focal points (independent for each prism), they emerge in separate equal beams, and diverge through the same angles as α and β respectively. In this way, the light proceeding up and down the sound is strengthened in the required ratio by utilizing, in the manner we have described, the light which would otherwise have been lost on the land. These instruments were first introduced at three sound lights in the w. of Scotland, in 1857, where apparatus of a small size, combined with a small burner, was found to produce, in the only directions in which the great power was required, beams of light equal to the largest class of apparatus and burner. The saving thus effected in oil, etc., has been estimated at about £400 or £500 per annum for these three stations.

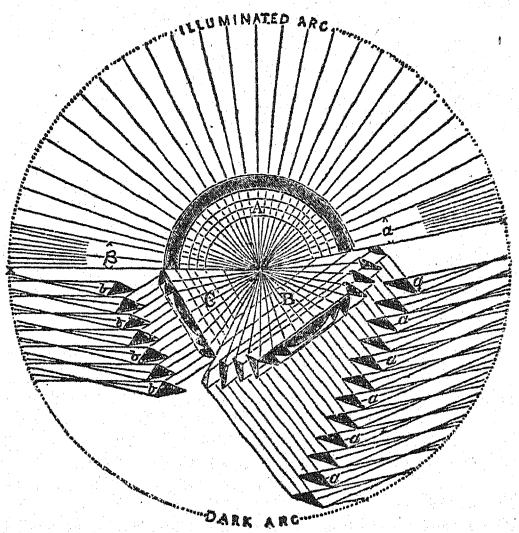

Fig. 3.

Apparent Light.—At Stornoway bay, the position of a sunk rock has been sufficiently indicated by means of a beam of parallel rays *thrown from the shore* upon certain optical apparatus fixed in the top of a beacon erected upon the rock itself. It was suggested that the light-house should be built on the outlying submerged reef, but the cost would have been very great, and Mr. Stevenson's suggestion of the apparent light was adopted. By means of this plan the expense of erecting a light-house on the rock itself has been saved, and all the purposes of the mariner served. It has been called an apparent light from its *appearing to proceed from a flame on the rock, while the light in reality proceeds from the shore*, about 650 ft. distant, and is refracted by glass prisms placed on the beacon.

Floating lights are vessels fitted with lights moored at sea in the vicinity of reefs. Prior to 1807 the lantern was hung at the yard-arm. The late Mr. Robert Stevenson then introduced the present system of lanterns, having a copper tube in the center capable of receiving the vessel's mast, which passed through the tube, the lights being placed all round. In this way proper optical appliances can be employed, and the lantern can be lowered on the mast so as to pass through the roof of a house on the deck, where the lamps are filled or trimmed. In 1864 six floating lights were constructed for the Hoogly under the directions of Messrs. Stevenson, in which the dioptric principle

was applied. Eight half-fixed light apparatus of glass with spherical mirrors behind were placed in the lantern round the mast, so as to show in every azimuth rays from three of them at once.

Differential Lens.—This is an annular lens, curved to different radii on both sides, so as to increase the divergence in any given ratio. The small arc of about 6°, which is unequally illuminated by the lens as presently constructed, may be made of equal intensity throughout by the differential form, or by means of separate straight prisms placed at the sides.

Sources of Light.—The descriptions which have already been given have all had reference to the best means of employing a given light. Many attempts have from time to time been made to increase the power of the radiant itself.

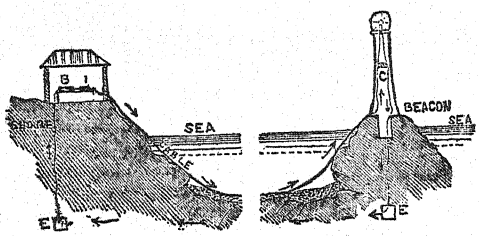
Magneto-electric Light.—The electric light, which has of late been greatly developed and improved, and especially adapted to light-house purposes, was introduced under the auspices of the Trinity house of London.

Gas.—The uncertainty and other objections attending the manufacture and use of gas in remote and inaccessible places have, with some exceptions, as yet prevented its adoption at light-house stations, but it has been successfully used at many harbor-lights.

Oil and Paraffine.—The oil which is chiefly employed in Great Britain is that which goes by the name of *colza*, and the quantities annually consumed at the northern light-houses may be stated at 40 galls. for an argand 1 in. in diameter, and 800 galls. for the four-wick burner, which is used in dioptric lights of the first order. Capt. Doty's burner for paraffine, which is the best which has as yet been suggested, has been introduced into the French and the Scotch light-houses. Paraffine has been found to give a more intense light than colza at half the cost.

Visibility of Lights.—The distance at which any light can be seen, of course depends on the height of the tower, and varies with the state of the atmosphere. The greatest recorded distance at which an oil light has been visible is that of the holophotal light of Allepey at Travancore, which has been seen from an elevated situation at a distance of 45 miles. The holophotal revolving light at Baccalieu, in Newfoundland, is seen every night in clear weather at cape Spear, a distance of 40 nautical miles.

Power of Light-house Apparatus.—The reflector (25 in. diam.) used in the northern light-houses, with a burner of 1 in. diam., is considered equal to about 360 argand flames. The cylindric refractor, used in fixed lights, with a four-wick burner, has been estimated at 250; while the annular lens in revolving lights, with the same burner, is equal to about 3,000 argand flames. See LIGHTING OF BEACONS AND BUOYS AT SEA.



LIGHT-HOUSE (*ante*). Light-houses were not constructed until some advancement was made in navigation, but beacon-fires were lighted for the guidance of the early mariners. The most celebrated ancient light-house was the Pharos (q.v.) of Alexandria, built upon a rocky point of that name which had been an islet, but was connected by Alexander the great with Alexandria by a roadway called the seven-mile mole, or *heptastadium*. The light-house was commenced by Ptolemy Soter, and finished about 280 B.C., and was regarded as one of the wonders of the world. It was about 400 ft. high, and the light which was kept burning on its top could be seen, according to Josephus, at a distance of 40 miles. It is thought to have been destroyed by an earthquake after having stood 1600 years. It was constructed in the form of the frustrum of a square pyramid, having an immense base whose dimensions are not known. The tower of Cordouan, at the mouth of the Garonne, in the bay of Biscay, is another celebrated light-house, but of modern date and still standing. It was commenced in 1584 and finished in 1610 by Louis de Foix. It stands upon a rocky ledge, which is under water except at low tide. The base is the frustrum of a cone, 135 ft. in diameter at the bottom, 16 ft. high, and 125 ft. in diameter at the top; built solid of cut stone, with the exception of a chamber in the center, 20 ft. square and 8 ft. high, containing a water cistern. A wall 12 ft. high and 11 ft. thick stands upon the margin of the upper surface of the base. The tower is 50 ft. in diameter at its base, is 115 ft. high, and is the frustrum of a cone, surmounted by a lantern dome. The entire height from the rock is 162 ft., the whole height of the tower, including the dome, being 146 feet. The first Fresnel lens ever manufactured was placed in this light-house in 1823. The Eddystone light-house in the English channel is described under the title EDDYSTONE (*ante*). The Bell rock light-house, off the e. coast of Scotland, is built upon a reef or rocks in the German ocean, 11 m. from the coast, nearly opposite the Tay firth. The rock upon which it stands is a red sandstone, from 12 to 15 ft. below spring tide, with from 2 to 4 ft. exposure at low tide. The structure is also of sandstone, but the outer tiers for 30 ft. high are of granite. It was designed by the celebrated Scotch engineers, Robert Stevenson and John Rennie, and constructed by the former. The erection of the second Eddystone light-house had given Smeaton much study, and his experience was taken advantage of by Stevenson in the structure at Bell rock. In form it resembles the Eddystone. The diameter at the base is 42 ft., while at the top, beneath the cornice, it is 15 feet. The stone-work is 102½ ft. high, and the whole structure, including the lantern, 115 feet. See BELL ROCK, *ante*. The Skerryvore light-house, built upon the Skerryvore rocks, which lie in the tracks of vessels going around the north of Ireland

or Scotland from the Clyde and Mersey, was constructed by Alan Stevenson, the son of Robert. See SKERRYVORE, *ante.* There are many very fine light-houses in the United States, the most noted of which was erected upon Minot's ledge, off the town of Cohasset, Massachusetts bay, about 20 m. e.s.e. of Boston, and one of the most dangerous places in the world without a signal. The difficulties in the construction of a light-house upon this rock were immense. An iron structure was first erected, being completed in 1849, which stood till April, 1851, when it was demolished by a terrific storm. The iron piles, 10 in. in diameter and sunk 5 ft. into the rock, were twisted off near the surface. In 1852 money was appropriated by congress for a new light-house, and work was commenced in 1855, but it was not till the latter part of 1857 that the first stone was laid. Four stones were laid in this year; six courses were, however, laid in 1858; and in 1859 the stone-work was completed. The whole was finished in 1860. It is a granite tower in the form of the frustrum of a cone, having a base 30 ft. in diameter, and a height of stone-work of 88 ft., the lower 40 ft. being solid. The courses are dove-tailed, and are fastened together with wrought-iron dowels. The defect in the iron Minot's ledge light-house was owing to the stinted outlay. Had three or four times as much money been expended on it, so that it could have been much broader at the base as well as higher, it would doubtless have been standing to-day. The present stone structure is a fair model of engineering, and will probably resist the waves for centuries. It possesses the advantage, which all solid or almost solid stone structures must have over iron framework, of a vastly greater amount of inertia, an important element of resistance to the waves. Its construction is said to have offered a more difficult problem than that of Bell rock or Skerryvore, one reason being that its foundation is deeper beneath the surface. The light-house at Spectacle reef, in the northern part of lake Huron, was built not only to resist waves, but ice-fields, often covering thousands of acres and moving at the rate of 2 or 3 m. per hour. That the structure should be able to withstand this force it was so designed as to cause the ice to be broken and piled into a protecting barrier. The tower is the frustrum of a cone, 32 ft. in diameter at the base, and 18 ft. just beneath the cornice at a height of 80 feet. The whole height of stone-work is 93 ft. above the base, which is 11 ft. below the surface of the water. The tower is solid as high as 34 ft., above which it contains 5 stories, each 14 ft. in diameter. The work was commenced May 1, 1870, and the light was first used June 1, 1874. The cost was $375,000. The first *cast-iron* light-house ever erected was at Point Morant, Jamaica, in 1842. The tower is built of 9 tiers of plates three-quarters of an in. thick and 10 ft. high, held together by bolts and flanges on the inside. The tower is filled in with masonry and concrete to the height of 27 feet. It rests upon a foundation of granite and rises to a height of 96 feet. It is 18½ ft. in diameter at the base, and 11 ft. at the top. A modern form of light-house is constructed on what is called the "screw-pile" system, an invention of Alexander Mitchell, who, with his son, laid the foundation of the light-house on Maplin sand, at the mouth of the Thames, England. Two similar structures followed, Chapman head in 1849 and Gunfleet in 1850, also near the mouth of the Thames. Other screw-pile lights were afterwards erected in different parts of the kingdom. The great feature of the screw-pile is that the piles upon which it rests are in the form of screws and are driven in the sand or soil to a sufficient depth in the manner of a corkscrew. The first screw-pile light-house erected in the United States was by by col. Hartman Bach, U. S. E., at the mouth of Delaware bay, 8 m. from the ocean, in 1847–50, where it stands at the present time in good condition, although in an exposed place, being often acted against by immense cakes or fields of ice which come down the Delaware and move to and fro with the ebb and flow of the tide. It is surrounded by an ice-breaker composed of screw-piles driven independently of the tower. The screw-pile light-house at Sand Key, Florida reefs, is supported on 16 piles, with an auxiliary pile in the center to support the staircase, making in all 17. They are 8 in. in diameter, with a screw of 2 ft. in diameter at the lower ends, which are bored 12 ft. into the reef. The framework of the tower consists of cast-iron tubular columns framed together, having wrought-iron ties at each joint, and braced diagonally on the faces of each tier. The keeper's house is supported by cast-iron girders and joists 20 ft. above the foundation. The structure is 120 ft. above the level of the water. The foundation is 50 ft. in diameter. Over 50 such light-houses have been erected in various parts of the United States.

LIGHT-HOUSE BOARD OF THE U. S., a body organized in accordance with an act of congress, approved Aug. 31, 1852, and having the control and management of all lights, buoys, beacons, etc., on the coasts of the United States. It consists of eight persons, viz., two officers of high rank in the navy, two officers of the corps of engineers, two civilians of high scientific attainments, an officer of the navy, and an officer of the corps of engineers—the two latter serving as secretaries. The board as thus constituted is attached to the office of the secretary of the treasury, who is *ex-officio* president of the same. A chairman, elected by the members from their own number, is chosen to preside in the absence of the president *ex-officio.* The board is required to meet four times a year, and the secretary of the treasury is empowered to call it together whenever, in his judgment, the exigencies of the service may require a meeting. It actually meets almost every week in the year. The coast and the waters of the country

are divided into districts, each of which is served by an officer of the army or the navy in the capacity of light-house inspector, and other officers are employed from time to time, according to the exigencies of the service. The different subjects requiring attention are first referred to standing committees, whose duty it is to investigate and report to the board what action, if any, is required. The two secretaries perform all routine and general administrative duties under the orders and regulations of the board.

LIGHTING OF BEACONS AND BUOYS AT SEA. The plan hitherto generally in use for illuminating a rock or reef where no light-house could be built is by means of an "apparent light," as in the case of a reef at Stornoway (see LIGHT-HOUSE). Of late, trial has extensively and successfully been made of electricity for this purpose. At various times, since the discovery of the electric light by sir H. Davy in 1813, suggestions have been made pointing out the advantages which might be derived from its use upon light-houses. It has long been plain, indeed, that for a purpose of this kind it had properties which placed it far in advance of all other lights—such as its near approach to sunlight in brightness, its great power of penetrating fogs, and its total independence of atmospheric air, which enables it to be produced in a vacuum or under water. Unfortunately, its production is attended with great trouble; it also requires rare skill to keep it in perfect order, and, even where this is at hand, we cannot yet place absolute reliance upon its steadiness. It has nevertheless been in use at Dungeness, in the s. of England, since 1862; and has been introduced with success at Souter point, Tynemouth (1871), at South Foreland (1873), and at the Lizard light-house (1878). It is used also at three French light-houses, at Odessa, and at Port Said at the entrance of the Suez canal. At Souter point the rearward rays of the light are reflected downwards, and used as a light in a different direction on a lower level. Whether or not the electric light is to be ultimately adopted for properly constructed light-houses, there can be little doubt that for the illumination of beacons, where no light-keeper is on the spot, electricity would be a most desirable agent to produce the light. As far as can be at present seen, the ordinary electric light (q.v.) may be dismissed as unsuitable for beacons. It will at least require to be greatly simplified before it can be used for such a purpose. In the article INDUCTION OF ELECTRIC CURRENTS will be found a description of the method of producing sparks by means of an induction coil. These sparks can be made to follow each other so quickly as to appear like a flash surrounded by a luminous haze. Taking advantage of this power of electricity, Mr. Thomas Stevenson proposed in 1866 to apply it to the illumination of beacons, and in that year a series of interesting experiments were made at Newhaven pier, with the aid of instruments constructed by Mr. Hart of Edinburgh. Although up to this time no further steps have been taken to make practical application of this suggestion, the proposal merits attention for its ingenious application of a scientific fact which had not as yet been successfully put to such a use. In the experiments referred to, the electric current passed through a wire 800 ft. long. Suppose a beacon to be situated at some distance from the shore, as shown upon the annexed diagram. A galvanic battery consisting of, say, six Bunsen cells, is placed at B in a house upon the shore. From this the electrical current is conveyed along a submarine cable to the beacon, and returns by earth-plates at E, E, in the usual manner to complete the circuit; its course being indicated on the diagram by arrows. The induction coil is placed upon the beacon at C, and properly connected with the conducting wire of the cable, so as to make the current generated by the battery traverse its primary coil. A wire from each end of its secondary coil is then conveyed to the focus of the optical apparatus, the ends of the two wires being here brought within half an inch of each other, and furnished with indestructible points of platinum. The induced or secondary current, in crossing this narrow space, produces the succession of sparks which constitute the light, but, as explained under the head INDUCTION OF ELECTRIC CURRENTS, it only does so at the moment the current is interrupted or broken. It is consequently necessary to have some means of completing and breaking the galvanic circuit in rapid alternations, so as to produce the flashes in quick succession. The break for this purpose is placed at I, near the battery.

In the experiments now described a great deal was found to depend upon the peculiar way the current was broken. None of the breaks in use giving a successful result, Mr. Hart devised a new one of an ingenious construction, which produced a more constant and powerful light. The difference between it and other mercury or spring breaks lies in the fact that with them the current is off and on for nearly equal spaces of time; but this one is so contrived that the wire is three times longer in the mercury than it is out of it; consequently, the current is three times longer on than it is off, and so allows the soft iron core of the induction coil to be more fully magnetized. The result of this

is a secondary current of comparatively high intensity, and of course the production of more brilliant sparks between its two terminals. We may explain that the moment the wire touches the mercury the current passes, and the moment it is removed the current stops. The wire alternately dips and rises by the action of an ordinary electro-magnet.

By the use of more than one induction coil the light could be materially increased, so that there seemed a likelihood of being able to produce it powerful enough to be seen at the distance of a few miles. Another method of lighting buoys as well as beacons without the aid of electricity has lately been shown to be practicable. Coal or other inflammable gas can be so compressed that a buoy may be made to receive at once and store up as much condensed gas as will suffice to keep a steady flame burning for a month or more. Gas for this purpose can be economically manufactured from some of the waste products of shale-oil works. Mr. Stevenson has also suggested the employment of electricity to ring bells, so as to give warning to sailors in foggy weather.

LIGHTNING (Fr. *éclair*, Ger. *Blitz*), the name given to the sudden discharge of electricity between one group of clouds and another, or between the clouds and the ground. It is essentially the same, though on a much grander scale, as the spark obtained from an electric machine. Clouds charged with electricity are called thunder-clouds, and are easily known by their peculiarly dark and dense appearance. The height of thunder-clouds is very various; sometimes they have been seen as high as 25,700 feet, and a thunder-cloud is recorded whose height was only 89 feet above the ground. According to Arago, there are three kinds of lightning, which he names lightning of the first, second, and third classes. Lightning of the first class is familiarly known as forked lightning (Fr. *éclair en zig-zag*). It appears as a broken line of light, dense, thin, and well defined at the edges. Occasionally, when darting between the clouds and the earth, it breaks up near the latter into one or two forks, and is then called bifurcate or trifurcate. The terminations of these branches are sometimes several thousand feet from each other. On several occasions the length of forked lightning has been tried to be got at trigonometrically, and the result gave a length of several miles. Lightning of the second class is what is commonly called sheet-lightning (Ger. *Flächenblitz*). It has no definite form, but seems to be a great mass of light. It has not the intensity of lightning of the first class. Sometimes it is tinged decidedly red; at other times, blue or violet. When it occurs behind a cloud, it lights up its outline only. Occasionally, it illumines the world of clouds, and appears to come forth from the heart of them. Sheet-lightning is very much more frequent than forked-lightning. Lightning of the third kind is called ball-lightning (Fr. *globes de feu*, Ger. *Kugelblitz*). This so-called lightning describes, perhaps, more a meteor, which, on rare occasions, accompanies electric discharge, or lightning proper, than a phenomenon in itself electrical. It is said to occur in this way: After a violent explosion of lightning, a ball is seen to proceed from the region of the explosion, and to make its way to the earth in a curved line like a bomb. When it reaches the ground it either splits up at once and disappears, or it rebounds like an elastic ball several times before doing so. It is described as being very dangerous, readily setting fire to the building on which it alights; and a lightning-conductor is no protection against it. Ball-lightning lasts for several seconds, and, in this respect, differs very widely from lightning of the first and second classes, which are, in the strictest sense, momentary.

The thunder (Fr. *tonnerre*, Ger. *Donner*) which accompanies lightning, as well as the snap attending the electric spark, has not yet been satisfactorily accounted for. Both, no doubt, arise from a commotion of the air brought about by the passage of electricity; but it is difficult to understand how it takes place. Suppose this difficulty cleared, there still remains the prolonged rolling of the thunder, and its strange rising and falling to account for. The echoes sent between the clouds and the earth, or between objects on the earth's surface, may explain this to some extent, but not fully. A person in the immediate neighborhood of a flash of lightning hears only one sharp report, which is peculiarly sharp when an object is struck by it. A person at a distance hears the same report as a prolonged peal, and persons in different situations hear it each in a different way. This may be so far explained. The path of the lightning may be reckoned at one or two miles in length, and each point of the path is the origin of a separate sound. Suppose, for the sake of simplicity, that the path is a straight line, a person at the extremity of this line must hear a prolonged report; for though the sound originating at each point of the path is produced at the same instant, it is some time before the sound coming from the more distant points of the line reaches the ear. A person near the middle of the line hears the whole less prolonged, because he is more equidistant from the different parts of it. Each listener in this way hears a different peal, according to the position he stands in with reference to the line. On this supposition, however, thunder ought to begin at its loudest, and gradually die away, because the sound comes first from the nearest points, and then from points more and more distant. Such, however, it is well known, is not the case. Distant thunder at the beginning is just audible, and no more; then it gradually swells into a crashing sound, and again grows fainter, till it ceases. The rise and fall are not continuous, for the whole peal appears to be made up of several successive peals, which rise and fall as the whole. Some have attempted to account for this modulation from the forked form of the light-

ning, which makes so many different centers of sound, at different angles with each other, the waves coming from which interfere with each other, at one time moving in opposite directions and obliterating the sound, at another in the same way, and then strengthening the sound produced by each. Thunder has never been heard more than 14 m. from the flash. The report of artillery has been heard at much greater distances. It is said that the cannonading at the battle of Waterloo was heard at the town of Creil, in the n. of France, about 115 m. from the field.

LIGHTNING (*ante*). The abbé Nolet is said to have been the first to remark the similarity of phenomena in discharges of lightning and of the electrical machine, but there was no experimental determination of the identity of their nature until Benjamin Franklin made his celebrated investigation of the subject by the use of a kite at Philadelphia in 1752. Three years previous to this, however, he made some interesting remarks upon the subject in his *Observations on Electricity*, showing that his mind had comprehended the causes even before he made his demonstrative experiments. He says: "Where there is a great heat on the land in a particular region the lower air is rarefied and rises; the cooler, denser air above it descends; the clouds in the air meet from all sides and join over the heated place; and if some are electrified, others not, lightning and thunder succeed and showers fall. Hence, thunder gusts after heats, and cool air after gusts. As electrical clouds pass over a country, high hills, trees, towers, chimneys, etc., draw the electric fire, and it is therefore dangerous to take shelter under a tree during a thunder gust. It is safer to be in the open fields for another reason. When the clothes are wet, if a flash, in its way to the ground, should strike your head it may run in the water over the surface of your body, whereas if your clothes were dry it would go through the body." Again: "Now, if the fire of electricity and that of lightning be the same, as I have endeavored to show in a former paper, and a tube of only 10 ft. long will discharge its fire at 2 or 3 in. distance, an electrified cloud of perhaps 10,000 acres may strike and discharge on the earth at a proportionally greater distance." Speaking of the discharging power of points he says: "May not a knowledge of this power of points be of use to mankind in preserving houses, churches, ships, etc., from the stroke of lightning by directing us to fix, on the highest parts of those edifices, upright rods of iron made sharp as a needle, and gilt to prevent rusting, and from the foot of the rods a wire down the outside of the building into the ground, or down round one of the shrouds of a ship, and down her sides till it reaches the water? Would not the pointed rods probably draw the electric fire silently out of the cloud before it came near enough to strike, and thereby secure us from the most sudden and terrible mischief?" He proposed various experiments, and, acting under his instructions, Dalibard had drawn electric sparks from an iron rod 40 ft. high at Marly in France, and had charged Leyden jars with the apparatus, May 10, 1752. Franklin did not make his kite-experiment till more than a month later, viz., June 15. It was natural that these experiments should be repeated all over the civilized world. Prof. Richman of St. Petersburg was killed, in the summer of 1753, by a bolt of lightning in the form of a blue ball as large as a man's fist which leaped from the insulated conductor to his head, which was about a foot distant. His companion was struck senseless and a door was torn from its place by the stroke. In the experiment of M. Romas of Nerac, France (see *ante*), which has been said by some to antedate Franklin's, he used a kite of about 18 sq.ft. surface, with a copper wire wound around the string, and an insulating silk cord at the ground end, near which an iron tube was placed as a secondary conductor. When the kite was at a height of 550 ft. during a storm, flashes of fire darted to the earth attended by loud explosions, and all light bodies in the vicinity were alternately, positively and negatively, electrified and propelled in various directions.

It has been shown by Cavallo, De Saussure, and others that the electrical condition of the atmosphere, in comparison with that of the earth, is positive; also, by Laplace, Lavoisier, Volta, and De Saussure that the cause of atmospheric electricity is evaporation from the surface of the earth; but, according to the experiments of Pouillet, evaporation does not produce opposite electrical conditions unless accompanied by chemical decomposition or separation of vapor from saline solutions, or from oxidizing surfaces or the leaves of growing plants. Currents of wind rushing over opposing objects, occasioning disturbance of electric equilibrium, are among the chief causes of atmospheric electricity, the electricity passing with the wind to elevated regions; or, on the two-fluid hypothesis, positive electricity being carried upwards, while the negative passes to the earth. In regard to the production of the various kinds of lightning and thunder, they may be explained according to a variety of circumstances. To account for the variations in tone and intensity of a thunder-clap as heard at a certain point—that is to say, to explain what conditions were present and what form or dimensions the discharge had—would be very difficult, perhaps impossible, from the fact that it is impossible to appreciate the extent of the process and the direction of the discharge or discharges. The reverberation of sound may be the result of one discharge, which is echoed from peak to peak or from crag to crag and probably from cloud to cloud, although the power of clouds to reflect sounds has not been determined. There may be a succession of discharges from different portions of different clouds to those of others, one explosion being succeeded by another in consequence of changes of electrical con-

ditions in various parts of the celestial and terrestrial apparatus. The increased intensity of a roll of thunder is probably to be accounted for in this way. The first sounds may be produced by successive minor discharges, causing electrical conditions between two large masses of clouds, or between a large mass and the earth, which result in the exchange of large quantities of electric fluid, or the descent of a powerful bolt to the earth. Although many phenomena of electricity are well known, and the electricity of chemical batteries can be measured and rendered serviceable, still its real nature is not known. It is not positively determined whether it is an imponderable body, an imponderable force, or merely a phenomenon resulting from the conditions of the matter with which it is connected. Until its nature be determined it cannot be said whether a ball of lightning is a moving mass of electrical matter, or of other matter in a peculiar electrical state. There is something wonderfully interesting and inexplicable in some of these moving masses of apparent fire. The ordinary laws of electrical attraction and repulsion will scarcely serve to explain their various freaks. They often seem as if propelled from behind, in the manner of an ordinary projectile; and the manner in which they pass into dwellings and demolish walls may indicate that they are driven against bodies, and not attracted by them.

LIGHTNING, ACCIDENTS FROM. According to the registrar-general's report of births, deaths, and marriages for the year 1871, it appears that during that year 28 persons were killed in England by lightning: none in London, 5 in the south-eastern division, 6 in the south midland, 1 in the eastern, 1 in the south-western, 2 in the west midland, 6 in the north midland, 4 in the north-western, 2 in Yorkshire, and 1 in the northern division. All except 5 were men, and chiefly laborers in the open air. In 1875 17 persons were killed; in 1877 only 10. Of 24 deaths from this cause in a previous report, 11 took place in summer, 10 in spring, 2 in autumn, and 1 in winter. Out of 103 deaths in 5 years (1852–56), there were 38 in July, and 22 in Aug.

A person struck by lightning is more or less stunned and deprived of consciousness for a time, often, no doubt, by mere fright, in which case the effect is transient; but sometimes in consequence of a shock given to the brain, in which latter case there is a certain amount of paralysis of motion and sensation. In a case recorded by Boudin in his *Géographie Médicale*, 1857, a gentleman who had been struck by lightning remained for an hour and a quarter apparently devoid of any indication of life; and the paralysis, which usually affects the lower limbs, may last for many months. Mr. Holmes, in his article on "Accidents from Lightning," in his *System of Surgery*, gives the following list of other affections caused by lightning: "Burns, more or less extensive; eruptions of erythema or of urticaria, which are said by one author to have reappeared with each succeeding thunder-storm; loss of hair over parts or the whole of the body; wounds; hemorrhage from the mouth, nose, or ears; loss of sight, smell, speech, hearing, and taste; or, in rare cases, exaltation of these special senses; cataract, imbecility, abortion." Another curious effect of lightning is that described under the head of LIGHTNING-PRINTS. In reference to the occasional loss of hair, M. Boudin (*op. cit.*) relates that the capt. of a French frigate, who was struck by lightning on board his ship, could not shave himself on the following day, the razor not cutting but tearing out his hair. From that day the beard disappeared, and the hair of the scalp, eyebrows, etc., gradually fell off, leaving him entirely bald. The nails of the fingers also scaled away. Sir B. Brodie tells a curious story of two bullocks, pied white and red, which were struck in different storms; in both cases the white hairs were consumed, while the red ones escaped. As a general rule, it seems that persons not killed on the spot usually recover. The burns present every degree of intensity; in some (probably exaggerated) cases we hear of men and animals being reduced to ashes, while in ordinary cases they vary from deep burns, difficult in healing, to mere vesications: they must be treated in the ordinary method. It was believed until recently that the burns are caused by the ignition of the clothes; it appears, however, from various cases collected by Dr. Taylor (*Med. Jurisp.*, 1865, p. 737), that burns, at all events in some cases, are the direct result of the electricity. One case is so singular that we shall give a few details regarding it. Mr. Fisher of Dudley was called in to see a man who 16 hours previously had been struck by lightning while milking a cow. The cow was killed on the spot, and the man was much injured, there being a severe burn extending from his right hip to his shoulder, and covering a large portion of the front and side of the body. His mind was wandering; there were symptoms of inflammatory fever, and he was confined to bed for 17 days, at the end of which time the healing process was not complete. On examining his dress, it was found that the right sleeve of his shirt was burned to shreds, but there was no material burning of any other part of his dress. Hence it is obvious that the dress may be burned without the surface of the body being simultaneously injured; and, further, that a serious burn may be produced on the body although the clothes covering the part may have escaped combustion.

The appearances after death vary extremely. The body sometimes retains the position which it occupied when struck, while in other cases it may be dashed to a considerable distance. The clothes are often burned or torn, and have a peculiar singed smell; and metallic substances about the person present signs of fusion, while such as are composed of steel become magnetic. There are generally marks of contusion or

laceration, or, if they are absent, extreme ecchymosis (q.v.) at the spot where the current entered or emerged. In addition to wounds and burns, fractures have also been noticed.

The treatment must be directed to the special symptoms, which are liable to great variations. Sir B. Brodie's advice is as follows: "Expose the body to a moderate warmth, so as to prevent the loss of animal heat to which it is always liable when the functions of the brain are suspended or impaired, and inflate the lungs, so as to imitate natural respiration as nearly as possible." These means should be fully tried, as respiratory action has been restored after more than an hour's suspension. Mr. Holmes additionally recommends cold affusion, stimulating enemata, and stimulants by the mouth; and recovery (he states) is apparently hastened by the administration of tonics, especially quinine, and gentle action on the skin by means of baths.

LIGHTNING-CONDUCTOR (Fr. *paratonnerre*, Ger. *Blitzableiter*). The principle of the lightning-conductor is that electricity, of two conducting passages, selects the better; and that when it has got a sufficient conducting passage, it is disarmed of all destructive energy. If a person holds his hand near the prime conductor of a powerful electric machine in action, he receives long forked stinging sparks, each of which causes a very sensible convulsion in his frame. But if he holds in his hand a ball, connected with the ground by a wire or chain, the above sensation is scarcely, if at all, felt as each spark occurs, for the electricity, now having the ball and wire passage to the ground, prefers it to the less conducting body. If, instead of a ball, a pointed rod were used, no sparks would pass, and no sensation whatever would be felt. The point silently discharges the prime conductor, and does not allow the electricity to accumulate in it so as to produce a spark; and the quantity passing at a time, even supposing the rod disconnected with the ground, is not sufficient to affect the nerves. If for the prime conductor of the machine we substitute the thunder-clouds; for the body, a building; for the convulsive sensation, as the evidence of electric power, heating and other destructive effects; for the ball, or rod, and wire, the lightning-conductor, we have the same conditions exhibited on a larger natural scale. It is easier, however, to protect a building from the attacks of lightning than the body from the electric spark, as the rod in the one case is a much better conductor, compared with the building, than it is compared with the body, and, in consequence, more easily diverts the electricity into it.

The lightning-conductor consists of three parts: the rod, or part overtopping the building; the conductor, or part connecting the rod with the ground; and the part in the ground. The rod is made of a pyramidal or conical form (the latter being preferable), from 8 to 30 ft. in height, securely fixed to the roof or highest part of the building. Gay-Lussac proposes that this rod should consist, for the greater part of its length below, of iron; that it should then be surmounted by a short sharp cone of brass; and that it should finally end in a fine platinum needle, the whole being riveted or soldered together, so as to render perfect the conducting connection of the parts. The difficulty of constructing such a rod has led generally to the adoption of simple rods of iron or copper, whose points are gilt, to keep them from becoming blunt by oxidation. It is of the utmost importance that the upper extremity of the rod should end in a sharp point, because the sharper the point the more is the electrical action of the conductor limited to the point and diverted from the rest of the conductor. There is thus less danger of the electricity sparking from the conductor at the side of the building into the building itself. Were the quantity of the electricity of the clouds not so enormous, the pointed rod would prevent a lightning-discharge altogether; but even as it is, the violence of the lightning-discharge is considerably lessened by the silent discharging power of the point previously taking place. According to Eisenlohr, a conical rod, 8 ft. in height, ought to have a diameter at its base of 13.3 lines, and one of 30 ft. a diameter of 26.6 lines.

The part of the lightning-conductor forming the connection between the rod and the ground is generally a prismatic or cylindrical rod of iron (the latter being preferable), or a strap of copper; sometimes a rope of iron or copper wire is used. Iron wire improves as a conductor when electric currents pass through it; copper wire, in the same circumstances, becomes brittle. An iron rope is much better, therefore, for conducting than a copper one. Galvanized iron is, of all materials, the best for conductors. The conducting-rod ought to be properly connected with the conical rod either by riveting or soldering or both. Here, as at every point of juncture, the utmost care must be taken that there is no break in the conduction. The conducting-rod is led along the roof and down the outside of the walls, and is kept in its position by holdfasts fixed in the building. There must be no sharp turns in it, but each bend must be made as round as possible. Considerable discussion has arisen as to the proper thickness for the conducting-rod. If it were too small it would only conduct part of the electricity, and leave the building to conduct the rest, and it might be melted by the electricity endeavoring to force a passage through it as an insufficient conductor. The Paris commission, which sat in 1823, gave the minimum section of an iron conductor as a square of 15 millimeters (about three-fifths of an inch) in side, and this they considered quite sufficient in all circumstances. A rod of copper would need to be only two-fifths of this, as copper conducts electricity about six times more readily than iron. This calculation is very generally followed in practice. In leading the conductor along the building it

should be kept as much apart as possible from masses of conducting matter about the building, such as iron beams, machinery, etc. These may form a broken chain of conductors communicating with the ground, and divert a portion of the electricity from the lightning-conductor. If such took place, then at each interruption electricity would pass in a visible and dangerous way, and the efficacy of the conductor would be lost. If the conductor cannot be properly insulated from these masses of metal, the necessary security is got by putting them in connection with the conductor, so as to form a part of it. Water-runs, leaden roofs, and the like, must, for this reason, all be placed in conducting connection with the conductor.

The portion of the lightning-conductor which is placed in the ground is no less worthy of attention than the other two. Should the lower part of the conductor end in dry earth, it is worse than useless, for when the lightning, attracted by the prominence and point of the upper rod, strikes it, it finds, in all likelihood, no passage through the unconducting dry earth, and, in consequence, strikes off to a part of the ground where it may easily disperse itself and be lost. Wherever it is practicable, a lightning-conductor should end in a well or large body of water. Water is a good conductor, and having various ramifications in the soil, offers the best facility to the electricity to become dispersed and harmless in the ground. The rod on reaching the ground should be let down a foot and a half, or 2 ft., into the soil, and then turned away at right angles to the wall from the building in a horizontal drain filled with charcoal, for about from 12 to 16 ft., and then turned into the well so far that its termination is little likely to be left dry. Where a well cannot be made, a hole 6 in. wide (wider, if possible) should be bored, from 9 to 16 ft., the rod placed in the middle of it, and the intervening space closely packed with freshly heated charcoal. The charcoal serves the double purpose of keeping the iron from rusting, and of leading away the electricity from the rod into the ground.

Lightning-conductors, when constructed with care, have been proved beyond a doubt to be a sufficient protection from the ravages of lightning. The circle within which a lightning-conductor is found to be efficacious is very limited. Its radius is generally assumed to be twice the height of the rod. On large buildings, it is therefore necessary to have several rods, one on each prominent part of the building, all being connected so as to form one conducting system. In ships, a rod is placed on every mast, and their connection with the sea is established by strips of copper inlaid in the masts, and attached below to the metal of or about the keel.

LIGHTNING-PRINTS are appearances sometimes found on the skin or clothing of men or animals that are either struck by lightning, or are in the vicinity of the stroke, and currently believed to be photographic representations of surrounding objects or scenery. The existence of such prints appears, from a theoretical point of view, highly improbable, as the essential conditions of forming a photographic image are wanting; still, several apparently well-authenticated instances have been recorded, which have led scientific authorities to give at least partial credence to them. One or two instances may serve to give a general idea of what are meant by lightning-prints. At Candelaria (Cuba), in 1828, a young man was struck dead by lightning near a house, on one of the windows of which was nailed a horse-shoe; and the image of the horse-shoe was said to be distinctly printed upon the neck of the young man beneath the right ear. On Nov. 14, 1830, lightning struck the château of Benatonnière, in La Vendée; at the time, a lady happened to be seated on a chair in the saloon, and on the back of her dress were printed minutely the ornaments on the back of the chair. In Sept., 1857, a peasant-girl, while herding a cow in the department of Seine-et-Marne, was overtaken by a thunder-storm. She took refuge under a tree; and the tree, the cow, and herself were struck with lightning. The cow was killed, but she recovered, and on loosening her dress for the sake of respiring freely, she saw a picture of the cow upon her breast. These anecdotes are typical of a great mass of others. They tell of metallic objects printed on the skin; of clothes, while being worn, receiving impressions of neighboring objects; or of the skin being pictured with surrounding scenery or objects, during thunder-storms. One object very generally spoken of as being printed is a neighboring tree. This may be accounted for by supposing that the lightning-discharge has taken place on the skin in the form of the electric brush (see ELECTRICITY), which has the strongest possible resemblance to a tree, and that this, being in some way or other imprinted on the skin, has led observers to confound it with a neighboring tree. Of other prints, it would be difficult to give a satisfactory account. However, observers have done something in imitation of them. It has been shown, for instance, by German observers, that when a coin is placed on glass, and a stream of sparks poured on it from a powerful electrical machine, on the glass being breathed upon, after its removal, a distinct image of the coin is traced out by the dew of the breath. Mr. Tomlinson, by interposing a pane of glass between the knob of a charged Leyden jar and that of the discharging-tongs, obtained a perfect *breath-figure* of the discharge on each side of the glass, which bore the most striking resemblance to a tree. With all due allowance for the probable printing-power of lightning, the accounts given of it, in most cases, bear the stamp of exaggeration; and such of them as have been inquired into have been found to dwindle to a very small residuum of fact, in which there remained little that was wonderful.

LIGHTS, USE OF, IN PUBLIC WORSHIP, a practice which prevailed in the Jewish (Exodus xxv. 31–39) and in most of the ancient religions, and which is retained both in the Roman and in the oriental churches. The use of lights in the night-services, and in subterranean churches, such as those of the early Christians in the catacombs, is of course easily intelligible; but the practice, as bearing also a symbolical allusion to the "Light of the world" and to the "Light of faith" was not confined to occasions of necessity, but appears to have been from an early time an accompaniment of Christian worship, especially in connection with the sacraments of baptism and the eucharist. The time of the service in which lights are used has varied very much in different ages. St. Jerome speaks of it only during the reading of the gospel; Amalarius, from the beginning of the mass till the end of the gospel; Isidore of Seville, from the gospel to the end of the canon; and eventually it was extended to the entire time of the mass. In other services, also, lights have been used from an early period. Lighted tapers were placed in the hand of the newly-baptized, which St. Gregory Nazianzen interprets as emblems of future glory. Indeed, in the Roman Catholic church, the most profuse use of lights is reserved for the services connected with that sacrament. The usage of blessing the paschal light is described elsewhere. See HOLY WEEK. The material used for lights in churches is either oil or wax, the latter in penitential time and in services for the dead being of a yellow color. In the Anglican church, candlesticks and, in some instances, candles themselves are retained in many churches on the communion table, but they are not lighted. The retention of them is greatly favored by the "high church" party, and much disapproved by the "low church" or "evangelical" party. In the Presbyterian and Independent churches of Britain, America, etc., the symbolical use of lights and candlesticks is rejected as superstitious.

LIGNE, CHARLES JOSEPH, Prince de, 1735–1814; b. in Brussels, and descended from a wealthy and powerful Belgian family; entered the Austrian army in 1752, where he served with distinction through the seven years' war. In the reign of Joseph II. he held high military and diplomatic positions, and was a great favorite in all the European courts. During the reign of Leopold he fell into disgrace, owing largely, no doubt, to his son's participation in the Belgian insurrection of 1790, after which event he was never again in the public service, but lived in retirement at Vienna, employing himself in literary pursuits. Of his miscellaneous works in 34 volumes, which appeared in 1795–1811, Malte Brun has given selections in 2 volumes. His memoirs and letters have considerable historic value.

LIG'NINE (derived from the Latin word *lignum*, wood) is the incrusting matter contained within the cellular tissue, which gives hardness to wood. Like cellulose, of which the cellular tissue is composed, it is insoluble in water, alcohol, ether, and dilute acids, and its chief chemical characteristic is, that it is more readily soluble in alkaline liquids than cellulose. Its exact composition is uncertain, but it is known to consist of carbon, hydrogen, and oxygen, and to differ in its composition from cellulose in containing a greater percentage of hydrogen than is necessary to form water with its oxygen. When submitted to destructive distillation, it yields acetic acid; and that it is the source of the pyroligneous acid (which is merely crude acetic acid) obtained by the destructive distillation of wood, is proved by the fact that the hardest woods (those, namely, which contain the greatest proportion of lignine) yield the largest amount of acid. Lignine is identical with the *matière incrustante* of Payen and other French botanists.

LIGNITE, fossil wood imperfectly mineralized, and retaining its original form and structure much more completely than the truly mineral *coals*, and therefore not improperly described as intermediate between peat and coal. *Brown coal*, *surturbrand*, and *jet* are generally regarded as varieties of lignite. The fossil plants of lignite are always terrestrial; palms and coniferous trees are amongst them. Remains of terrestrial mammalia are also found in it.

LIGNITE (*ante*), named from *lignum*, wood, a kind of coal, resembling, probably the condition of hard coal when in a state of transition or process of manufacture. It has no definite chemical composition. Some beds present a decidedly ligneous structure in the upper layers, and a true coal character below. When wood is buried in water or earth, it decomposes by the slow process of oxidation, or eremacausis, with the formation of carbureted hydrogen, carbonic acid, carbonic oxide, water, petroleum, etc., after a time leaving a denser, darker substance. After a long time it becomes black and exhibits a pitchy, somewhat conchoidal fracture. It is then lignite. This kind of coal is chiefly found in the cretaceous and tertiary formations, and in some localities forms immense beds, equal, perhaps, in extent to the beds of the carboniferous period. Lignite occupies an intermediate position between peat and hard and bituminous coal, and in favorable conditions in the process of ages peat will become lignite, and the latter will be converted into bituminous coal or anthracite. It is probable that most of the coal in China and India is more or less lignitic in its nature, as is the case of that of western America. Lignite is found also in Greenland and arctic America, and also in Central and South America. In Europe lignites have been mined for a long time, and are used not only for heating dwellings and other domestic purposes, but for generating steam in locomotives and furnaces. The following

analyses indicate the variable composition of lignite. One specimen from France contained, in round numbers, the following proportion of constituents: Carbon, 70; hydrogen, 6; oxygen, 18; nitrogen, 1; ashes, 5. Another specimen, also from France, contained, carbon, 64; hydrogen, 4.6; oxygen, 17; nitrogen 1; ashes, 13.4. Another specimen from Switzerland contained, carbon, 70; hydrogen, 5; oxygen, 20.5; nitrogen, 1.3; ashes, 3.2. Another specimen from Siberia contained, carbon, 47.5; hydrogen, 4.5; oxygen, 32; nitrogen, 1; ashes, 15. Another specimen from Germany contained, carbon, 70; hydrogen, 3.2; oxygen, 7.6; nitrogen, 1; ashes, 15.5. The last specimen shows a considerably less proportion of oxygen than the others, but that of carbon is scarcely greater than in the other specimens. It is to be presumed that its heating power does not differ much from theirs. The principal deposits of lignite in the United States are in New Mexico, Colorado, Utah, Nevada, California, Oregon, Wyoming, and Alaska. In New Mexico the beds are all in the cretaceous formation, and chiefly in the lower portion. In Colorado and Wyoming the beds occupy a space not less than 50,000 sq.m., the strata varying in thickness from 1 to 30 feet. Many of these lignites are now mined in Colorado, and they resemble in quality the best brown coals of the old world. Some lignites, as in Trinidad, and in Utah, near Salt Lake City, are capable of being coked and used in smelting. The lignites of California are cretaceous, and many of them find their way to San Francisco. On the coast of Oregon the lignites belong to the tertiary period, and have been mined for several years. An analysis of a specimen of coal from Mount Diablo, Cal., by H. S. Munroe of the N. Y. school of mines, gave the following results: Carbon, 59.724; hydrogen, 5.078; oxygen, 15.697; nitrogen, 1.008; sulphur, 3.916; water, 8.940; ash, 5.637. A lignitic anthracite from Sonora gave, carbon, 84.103 hydrogen, 0.852; oxygen, 2.137; nitrogen, 2.80; sulphur, 0.229; water, 5.191; ash 7.204. This is evidently a superior coal, considered as a lignite. There are occasionally seams of lignite along the Atlantic coast in tertiary formations, mingled more or less with clay.

LIG'NUM RHO'DIUM, a kind of wood which occurs as an article of commerce, having a pleasant smell resembling the smell of roses. It is brought to Europe in strong, thick, and rather heavy pieces, which are cylindrical but knotty, and sometimes split. They are externally covered with a cracked gray bark; internally, they are yellowish, and often reddish in the heart. They have an aromatic bitterish taste, and, when rubbed, emit an agreeable rose-like smell. This wood comes from the Canary islands, and is produced by two shrubby and erect species of *convolvulus*, with small leaves, *C. scoparius* and *C. floridus*. It is the wood both of the root and of the stem, but the latter is rather inferior. An essential oil (*oil of lignum rhodium*), having a strong smell, is obtained from it by distillation, and is used for salves, embrocations, etc., and also very frequently for adulteration of oil of roses.—Besides this lignum rhodium of the Canary islands, an American kind is also a common article of commerce; it is produced by the *amyris balsamifera*, a native of Jamaica, and yields an essential oil, very similar to the former. The lignum rhodium of the Levant is now scarcely to be met with in commerce. It is the produce of *liquidambar orientale*. From this, however, the name has been transferred to the other kinds.

LIG'NUM-VI'TÆ, the wood of *guaiacum officinale* (nat. ord. *zygophyllaceæ*), and probably of some other species, natives of Jamaica and St. Domingo. The hardness and exceeding toughness of this very useful wood was shown by prof. Voigt to depend upon a very peculiar interlacing of the fibers. The heart-wood, which is the part used, is very dense and heavy, of a dark, greenish-brown color, rarely more than 8 in. in diameter; the stem itself seldom reaches 18 in. in diameter, and grows to the height of about 30 feet. The wood is much valued for making the wheels of pulleys and other small articles in which hardness and toughness are required; large quantities are consumed in making the sheaves (see PULLEY) of ships' blocks. Besides these uses, the wood, when reduced to fine shavings or raspings, the bark, and also a greenish resin which exudes from the stem, are much used in medicine, being regarded as having powerful anti-syphilitic and anti-rheumatic properties. See GUAIACUM.

LIG'NY, a village in Belgium, in the province of Namur, about 10 m. n.e. of Charleroi, famous on account of the battle fought here by the French, under Napoleon, and the Prussians under Blücher, June 16, 1815, the same day on which the French, under marshal Ney, were engaged with the British, under Wellington, at Quatre-Bras. Napoleon had formed a plan for overpowering his antagonists in detail ere they could concentrate their forces; and contrary to the expectations both of Wellington and Blücher, began his operations by assailing the Prussians. The battle took place in the afternoon. The possession of the villages of Ligny and St. Amand was hotly contested; but the Prussians were at last compelled to give way. The Prussians lost in this battle 12,000 men and 21 cannon; the French 7,000 men. A mistake prevented a corps of the French army, under Erlon, from taking the part assigned to it in the battle, and led to Ney's encountering the Belgians and British at Quatre-Bras (q.v.), instead of uniting his forces with those engaged against the Prussians at Ligny.

LIG'ULATE (Lat. *ligula*, a little tongue), a term used in botany to describe a corolla of one petal split on one side, and spread out in the form of a tongue or strap, toothed at the extremity. This form of corolla is very common in the *compositæ*, appearing in all

the florets of some, as the dandelion, and only in the florets of the *ray* of others, as the daisy and aster. The term, however, is of general application.

LIGULE. See GRASSES.

LIGUORI, ALFONZO MARIA DE, a saint of the Roman Catholic church, and founder of the order of Liguorians or Redemptorists. He was b. of a noble family at Naples, Sept. 27, 1696, and embraced the profession of the law, which, however, he suddenly relinquished for the purpose of devoting himself entirely to a religious life. He received priest's orders in 1725; and in 1732, in conjunction with twelve companions, founded the association which is now called by his name. See LIGUORIANS. In 1762 he was appointed bishop of Sant' Agata dei Goti, in the kingdom of Naples, and his life, as a bishop, is confessed by Protestant as well as Catholic historians to have been a model of the pastoral character; but, shrinking from the responsibilities of such an office, he resigned his see in 1775, after which date he returned to his order, and continued to live in the same simple austerity which had characterized his early life. Having survived his retirement twelve years, he died at Nocera dei Pagani, Aug. 1, 1787, and was solemnly canonized in the Roman Catholic church in 1839. Liguori is one of the most voluminous and most popular of modern Catholic theological writers. His works, which extend to 70 volumes 8vo, embrace almost every department of theological learning—divinity, casuistry, exegesis, history, canon law, hagiography, asceticism, and even poetry. His correspondence also is voluminous, but is almost entirely on spiritual subjects. The principles of casuistry explained by Liguori have been received with much favor in the modern Roman schools; and in that church his moral theology, which is a modification of the so-called "probabilistic system" of the age immediately before his own, is largely used in the direction of consciences. See PROBABILISM. It would be out of place here to enter into a discussion of the exceptions which have been taken to certain portions of it on the score of morality, whether in reference to the virtue of chastity or to that of justice and of veracity. These objections apply equally to most of the casuists, and have often been the subject of controversy. Liguori's *Theologia Moralis* (8 vols. 8vo) has been reprinted numberless times, as also most of his ascetic works. The most complete edition of his works (in Italian and Latin) is that of Monza, 70 volumes. They have been translated entire into French and German, and in great part into English, Spanish, Polish, and other European languages.

LIGUO'RIANS, called also REDEMPTORISTS, a congregation of missionary priests founded by Liguori in 1732, and approved by pope Benedict XIV. in 1759. Their object is the religious instruction of the people and the reform of public morality, by periodically visiting, preaching, and hearing confessions, with the consent and under the direction of the parish clergy. Their instructions are ordered to be of the plainest and most simple character, and their ministrations are entirely without pomp or ceremonial. The congregation was founded originally in Naples, but it afterwards extended to Germany and Switzerland. In the Austrian provinces they had several houses, and were by some represented as but establishments of the suppressed Jesuits under another name. Nothing, however, could be more different than the constitution and the objects of the two orders. Since the restoration, and especially since the revolution of 1830, the Liguorians have effected an entrance into France, and several houses of the congregation have been founded in England, Ireland, and America; but their place is in great measure occupied by the more active congregation of the Lazarist or Vincentian fathers, whose objects are substantially the same, and who are much more widely spread. See PAUL, VINCENT DE, and VINCENTIAN CONGREGATION.

LIGURIA (LIGURIAN REPUBLIC, *ante*), in ancient geography, a part of n. Italy. As defined in the time of Augustus it embraced the territory from the Ligurian sea across the maritime Alps to the Po in the n., and from the Varus in the w. to the Macra in the east. At a very early period the Ligures possessed a larger territory, extending far into Gaul, on the western side of the Rhone. Their origin is unknown, but they were a warlike and enterprising people. They were subjugated by the Romans about 125 B.C., Liguria forming the nucleus of the Roman province of Gaul.

LIGU'RIAN REPUBLIC, the name given to the republic of Genoa in 1797, when, in consequence of the conquests of Bonaparte in Italy, it was obliged to exchange its aristocratic for a democratic constitution. See GENOA. The name was chosen because the Genoese territory formed the principal part of ancient Liguria.

LILAC, *Syringa*, a genus of plants belonging to the natural order *oleaceæ*, and consisting of shrubs and small trees, with 4-cleft corolla, 2 stamens, and a 2-celled, 2-valvular capsule. The COMMON LILAC (*S. vulgaris*) is one of the most common ornamental shrubs cultivated in Europe and North America. It is a native of the n. of Persia, and was first brought to Vienna by Busbecq, the ambassador of Ferdinand I., to whom we also owe the introduction of the tulip into European gardens. From Vienna it soon spread, so that it is now to be found half wild in the hedges of some parts of Enrope. There are many varieties. The flowers grow in large conical panicles; are of a bluish "*lilac*" color, purple or white, and have a very delicious odor. The leaves are a favorite food of cantharides. The bitter extract of the unripe capsules has very marked tonic and febrifugal properties. The wood is fine-grained, and is used for inlaying,

turning, and the making of small articles. A fragrant oil can be obtained from it by distillation. The CHINESE LILAC (*S. Chinensis*) has larger flowers, but with less powerful odor, and the PERSIAN LILAC (*S. Persica*) has narrower leaves. Both are often planted in gardens and pleasure-grounds. There are several other species.

LIL'BURNE, JOHN, 1618–1657; a Protestant agitator of England. Imbibing opinions in opposition to the English church, at the age of 18 he went to Holland to procure the printing of a pamphlet against the bishops. This he aided to circulate secretly, was exposed to the authorities, tried in the court of the star-chamber, condemned in Feb., 1637, to receive 500 lashes, to be pilloried and confined in prison, fined £500, and required to give security for good behavior. His bold courage before the judges gave him the *sobriquet* of "Freeborn John." Given his liberty in 1640 he placed himself at the head of his sympathizers and demanded that lord Stratford should be arraigned. He was again arrested and taken before the house of lords; but such was the pressure of public opinion in his favor that the parliament ("long parliament") released him, and subsequently declared his punishment to have been illegal, barbarous, and tyrannical; and recompensed him for his imprisonment and injuries by a payment to him of £3,000. He joined the army of the parliament against Charles I., was taken prisoner, and would have been hung, had not the parliament's general, the duke of Essex, threatened to hang royalist prisoners in retaliation. He soon became dissatisfied with the Presbyterian leaders, and published charges and denunciations even against Cromwell. The latter procured his trial before a commission, by whom he was acquitted. Emboldened by this, he began a violent agitation against Cromwell, read in public a pamphlet entitled *England's New Chains*, and in consequence was committed to the Tower. Thence he poured out political pamphlets which gave him great popularity with the people. He was again brought to trial, but the pressure of popular opinion in his favor determined his acquittal. But Cromwell soon after secured his condemnation and banishment for a vicious attack on Kaslering. He then resided in Brussels and Amsterdam. After the dissolution of the "long parliament," he returned to England without permission, and Cromwell sought to imprison him in the Tower; but it ended in his remaining in England as a prisoner at large. Towards the close of his quarrelsome life he espoused the doctrines of the Friends, or Quakers. Judge Jenkins said of him: "Were John Lilburne the only man living on the earth, Lilburne would dispute with John, and John with Lilburne." An account of his trials, entitled *Truth's Victory over Tyrants*, was published in 1649.

LILIA'CEÆ, a natural order of endogenous plants, containing about 1200 known species. They are most numerous in the warmer parts of the temperate zones. They are mostly herbaceous plants, with bulbous or tuberous, sometimes fibrous, roots; rarely shrubs or trees. The shrubby and arborescent species are mostly tropical. The stem is simple, or branching towards the top, leafless or leafy. The leaves are simple, generally narrow, sometimes cylindrical, sometimes fistular. The flowers are generally large, with 6-cleft or 6-toothed perianth; and grow singly or in spikes, racemes, umbels, heads, or panicles. The stamens are six, opposite to the segments of the perianth; the pistil has a superior 3-celled, many-seeded ovary, and a single style. The fruit is succulent or capsular; the seeds packed one upon another in two rows. This order contains many of our finest garden, green-house, and hot-house flowers, as lilies, tulips, dog's-tooth violet, lily of the valley, tuberose, crown imperial, and other fritillaries, hyacinths, *gloriosa superba;* many species useful for food, as garlic, onion, leak, and other species of *allium*, asparagus, the quamash or biscuit root (*camassia esculenta*) of North America, the ti (*dracæna terminalis* or *cordyline ti*) of the South seas, etc.; many species valuable in medicine, as squill, aloes, etc.; and some valuable for the fiber which their leaves yield, as New Zealand flax, and the species of bowstring hemp or *sanseviera*.—This natural order has been the subject of a number of splendid works, among which may be particularly named Redoute's *Les Liliacées* (8 vols. Paris, 1802–16).

LILLE (formerly L'ISLE, "the island;" Flemish, *Ryssel*), an important manufacturing t. and fortress in the n. of France, chief town of the department of Nord, is situated on the Deule, in a level, fertile district, 140 m. n.n.e. of Paris, and 62 m. s.e. of Calais. The streets are wide, the squares imposing, and the houses, which are mostly in the modern style, well built. The principal buildings and institutions are the medical school, the lyceum, the bourse, and the palace of Richebourg, now the Hotel-de-Ville, in which is the school of art, with a famous collection of drawings by Raphael, Michael, and other masters. Lille derives its name from that of the castle around which the town originally arose, and which from its position in the midst of marshes was called Isla. It was founded in 1007 by Baldwin, the fourth count of Flanders, and has suffered greatly from frequent sieges. Of these, the most recent, and perhaps the most severe, took place in 1708 and 1792. On the former occasion, during the war of the Spanish succession, the garrison capitulated to the allies, after a bombardment of 120 days; on the latter, the Austrians, after a terrific bombardment, were obliged to raise the siege. Lille is an important military center. It is also the seat of extensive and thriving manufactures. The goods principally manufactured are linen, hosiery, gloves, blankets, lace, *Lille* thread, and tulle. The town contains many spinning-mills, bleach-fields, sugar-

refineries, distilleries, tan-pits, dye-houses, etc. In the vicinity are numerous oil-mills, porcelain-factories, and glass and pottery works. Pop. '76, 137,560.

LILLEBONNE, a small t. of northern France on the river Bolbec, 40 kilometers e. of Havre; pop. 4,800; has manufactures of thread, cotton, and linen fabrics. William the conqueror gave it importance by the construction there of a *château-fort*. Old Roman roads diverge from it to Rouen, Paris, Evreux, and Dreux. It was a city of importance under the Romans, as attested by considerable ruins, among which are those of a theater 340 ft. long.

LILLERS, a small t. in the n. of France on the river Mare; pop. 6,600. Principal industries, the manufacture of shoes for exportation, of linens, and of beer and distilled liquors.

LILLIBURLERO, the refrain of an Irish ballad, which appeared before the revolution of 1688, and is said to have exercised a profound influence, going far to precipitate that outbreak. The words "lilliburlero and bullen-a-lah" (Irish) are said to have been employed by the Irish Roman Catholics during the Protestant massacres of 1641. The ballad in question, alleged to have been written by lord Wharton, took up these words and employed them to fire the hearts of the king's soldiers.

LIL'LIPUT, the name of a fabulous kingdom described by Swift in *Gulliver's Travels*, of which the inhabitants are not greater in size than an ordinary man's finger. The term Lilliputian has come into common use as a designation of anything very diminutive.

LIL'LO, GEORGE, 1693–1739; an English dramatist of vigorous style and of a moral tendency in advance of his time; the representative of the domestic manners and tastes of the middle classes. His plays of *Silvia* and *George Barnwell* both appeared in 1731. The latter was extremely popular, and greatly delighted queen Caroline. It was imitated by Saurin and played in France under the title of *Beverly*. His other works are the *Christian Hero; Marina;* and *Elmerick*. These works were collected and published in 2 vols. 12mo. in 1772.

LILLY, JOHN. See LYLY, *ante*.

LILLY, WILLIAM, an English astrologer, b. at Diseworth, in Leicestershire, in 1602. Whilst yet a young man, he was employed as book-keeper by a merchant in London, who could not write, and on his employer's death married his widow, with whom he obtained a fortune of £1000 sterling. He betook himself to the study of astrology, particularly the *Ars Notoria* of Cornelius Agrippa, and soon acquired a considerable fame as a caster of nativities, and a predictor of future events. In 1634 he is said to have obtained permission from the dean of Westminster to search for hidden treasure in Westminster abbey, but was driven from his midnight work by a storm, which he ascribed to hellish powers. From 1644 till his death he annually issued his *Merlinus Anglicus Junior*, containing vaticinations, to which no small importance was attached by many. In the civil war he attached himself to the parliamentary party, and was actually sent in 1648, with another astrologer, to the camp at Colchester, to encourage the troops, which service he performed so well that he received a pension for it, which, however, he only retained two years. Nevertheless, he made a small fortune by his "art" during the commonwealth, and was able to purchase an estate. After the restoration, he was for some time imprisoned, on the supposition that he was acquainted with the secrets of the republicans; but being set free, he retired to the country. He was again apprehended on suspicion of knowing something of the causes of the great fire of London in 1666. He died June 9, 1681, at his estate at Hersham. Lilly wrote nearly a score of works on his favorite subject. They are of no value whatever, except to illustrate the credulity or knavery of their author.

LILY, a genus of plants of the natural order *liliaceæ*, containing a number of species much prized for the size and beauty of their flowers. The perianth is bell-shaped, and its segments are often bent back at the extremity. The root is a scaly bulb, the stem herbaceous and simple, often several feet high, bearing the flowers near its summit.—The WHITE LILY (*L. candidum*), a native of the Levant, has been long cultivated in gardens, and much sung by poets. It has large, erect, pure white flowers, as much prized for their fragrance as for their beauty.—The orange lily (*L. bulbiferum*), a native of the s. of Europe, with large, erect, orange-colored flowers, is a well-known and very showy ornament of the flower-garden.—The martagon or Turk's cup lily (*L. martagon*), a native of the s. of Europe, and allied species with verticillate leaves and drooping flowers, are also common in gardens. The tiger lily (*L. tigrinum*) is a native of China, remarkable for the axillary buds on the stem; and some very fine species are natives of North America, as *L. superbum*, which grows in marshes in the United States, has a stem 6 to 8 ft. high, and reflexed orange flowers, spotted with black; *L. Canadense*, etc. Several very fine species have been introduced from Japan, as *L. Japonicum*, *L. speciosum*, and *L. lancifolium*.—The bulbs of *L. pomponium*, *L. martagon*, and *L. Kamtschacense*, are roasted and eaten in Siberia. That of *L. candidum* loses its acridity by drying, roasting, or boiling; when cooked, it is viscid, pulpy, and sugary, and is eaten in some parts of the east.—Lilies are generally propagated by offset bulbs. A single scale of the bulb will, however, suffice to produce a new plant, or even part of a scale, of

which skillful gardeners avail themselves.—The name lily is often popularly extended to flowers of other genera of the same order, and even of allied orders.

LILY, GIGANTIC, *Doryanthes excelsa*, of Australia, a plant of the natural order *amaryllideæ*, with flowering stem 10 or 14, sometimes 20 ft. high, bearing at top a cluster of large crimson blossoms. The stem is leafy, but the largest leaves are near the root. This plant is found both on the mountains and the sea-coast of New South Wales. It is of splendid beauty. The fiber of its leaves has been found excellent for ropes and for textile fabrics.

LILYBÆ'UM. See MARSALA, *ante.*

LILYE, or LILLY, WILLIAM, 1466–1523; a celebrated English grammarian; graduated at Oxford, and immediately afterwards traveled in the orient to perfect his knowledge of the Greek language. He passed five years at the ancient city of Rhodes, then resided in Rome, and returned to London in 1509. There he opened the first public school for teaching the dead languages. He became, soon after, the first master of St. Paul's school, and in the intervals of his duties edited and published a work known as *Lilly's Grammar;* to which dean Colet, the great Erasmus, and cardinal Wolsey each contributed a part. It was a quarto volume, published in London in 1513, and is said to have passed through more editions than any similar work.

LILY OF THE VALLEY, *Convallaria*, a genus of plants of the natural order *liliaceæ*, having terminal racemes of flowers; a white, bell-shaped, or tubular 6-cleft or 6-toothed perianth; a 3-celled germen, with two ovules in each cell, and a succulent fruit.—The species commonly known as the lily of the valley (*C. majalis*), the *Maiblume* or May-flower of the Germans, grows in bushy places and woods in Europe, the north of Asia, and North America, and has a leafless scape, with a raceme of small flowers turned to one side. It is a universal favorite on account of its pleasing appearance, the fragrance of its flowers, and the early season at which they appear. It is therefore very often cultivated in gardens, and *forced* to earlier flowering in hot-houses. Varieties are in cultivation with red, variegated, and double flowers. The berries, the root, and the flowers have a nauseous, bitter, and somewhat acrid taste, and purgative and diuretic effects. The smell of the flowers, when in large quantity and in a close apartment, is narcotic. Dried and powdered they become a sternutatory. The esteemed *eau d'or* of the French is a water distilled from the flowers.—Allied to lily of the valley is Solomon's seal (q.v.).

LI'MA, the capital of the republic of Peru, stands on the Rimac, from whose name its own is corrupted, in lat. 12° 3′ s., and long. 77° 5′ west. It is 6 m. distant from its port, on the Pacific, Callao, with which it is connected by a railway. Including its suburban villages, ten in number, it contains ('76) 100,073 inhabitants. Lima is of Spanish origin, and its generally magnificent public buildings entitle it to rank as the handsomest city of South America. At one time the grand *entrepôt* for the west coast of the continent, it still carries on a large trade, importing cottons, woolens, silks, hardware, wines, and brandy; and exporting silver, copper, bark, soap, vicuna wool, chinchilla skins, niter, sugar, etc. The temperature is agreeable, averaging 68.1° in winter and 77.6° in summer; and the climate is comparatively salubrious, abundant dews making up for the want of rain.

LIMA (*ante*). The approaches to the city are by six gates; and the principal alameda, an avenue of great beauty on the road to Callao, is one of the most striking and impressive thoroughfares on the continent. The general impression made by the city on nearing it is more in its favor than on a closer examination. At a distance, its spires and domes glitter in the sun, and its architecture, Moorish in character, gives it a very picturesque appearance. But, excepting the public buildings, the houses are low, and irregularly built, though the streets are regular and attractive. The plaza mayor, or great square, has a handsome fountain in the center, and is the principal business locality. Here are the palace of the president of Peru, the cathedral, and the archbishop's palace; the old palace of Pizarro is on the south side, and on the west is the town-hall. An immense amphitheater for bull-fighting is a feature of one of the alamedas. The longest side of the city, which is in the form of a triangle, extends along the bank of the river Rimac. Through the middle of almost every street a stream of water is turned each morning, designed to carry away whatever refuse collects from the houses; and this process, combined with the service of the buzzards, comprises the public scavengering of the city. The monasteries and convents of Lima, of which there were at one time a large number, have nearly all been suppressed. The convent of San Francisco, however, is a large monastic establishment, covering nearly seven acres of ground: there are also many parish churches and 22 chapels. The university of Lima was the first educational establishment of the kind in the new world. It has fallen into decay to some extent, but contains a valuable library of about 20,000 volumes. Lima was founded by Pizarro in 1535, and called Ciudad de los Reyes. It has been frequently visited by earthquakes, one of which, in 1746, destroyed many buildings. The city has recently (Jan., 1881) been captured by the Chilian forces in the process of the lamentable war between Peru and Chili.

LIMA WOOD, a name of the dye-wood also called Pernambuco wood, Nicaragua wood, and peach wood, the heart-wood of *Cæsalpinia echinata*. See BRAZIL WOOD. It is extensively used for dyeing red and peach-color.

LIMAX and **LIMACIDAE**. See SLUG.

LIMB, the border or edge of the disk of a heavenly body, particularly the sun and moon. The name is applied to the graduated circle of an instrument for measuring angles. A concentric arc used for subdividing the spaces or degrees on the limb, is called a vernier. There are two limbs on a theodolite, one for measuring horizontal and another for measuring vertical angles, called respectively the horizontal and the vertical limb. The graduated staff of a leveling rod is often called a limb, the graduated line on the vane being called the vernier.

LIMBER is half the field-equipage of a cannon or howitzer. The one half consists of the carriage itself, with the gun; while the limber, a two-wheeled carriage, fitted with boxes for the field-ammunition of the piece, and having shafts to which the horses are harnessed, forms the remainder. At the back-part, the limber has a strong hook, to which, on the march, is attached the foot of the gun-carriage by a ring. This constitutes at once a four-wheeled frame, which, while easier for transport than a gun on two wheels only, has the advantage of keeping together the gun and its ammunition. In marching, the gun points to the rear; but in coming to action, the artillerymen, by a rapid evolution, wheel round, so that the gun points to the front. It is then *unlimbered*, or unhooked, and the limber conveyed far enough to the rear to be out of the way of the men working the piece. To *limber up* again and retreat or pursue is the work but of a few moments.

LIMBO. See LIMBUS, *ante*.

LIM'BORCH, PHILIPPUS VAN, 1633–1712; b. Amsterdam; was educated in theology, and in 1657 made minister at Gonda, and ten years later professor of theology at the Remonstrant college of Amsterdam. He was a careful student of the doctrines of Arminius, and wrote *Theologia Christiana*, an elaborate and profound analysis of them, published 1686 and highly praised by Hallam. He was in frequent correspondence with John Locke.

LIM'BURG, an old province of Belgium, which, after having formed part of Belgium, France, Holland, and Austria, was, in 1839, divided between Belgium and Holland.—BELGIAN LIMBURG, or LIMBOURG, in the n.e. of the kingdom, is separated from Holland by the Meuse up to lat. 51° 9′ n., and thence by a line running e.n.e. to the northern boundary of the kingdom. The surface of the province is flat, and a large portion of it is occupied by barren heath; but in the s. and center there is good arable land. There is excellent pasturage along the banks of the Meuse, and large herds of cattle and swine are here reared. The manufactures include soap, salt, pottery, paper, tobacco, straw-hats, beet-sugar, etc. The area of the province is 928 English sq.m., and the pop. '76, 206,187. The capital of the province is Hasselt (q.v.).

LIMBURG, a province of Holland, which was once also a duchy in the Germanic confederation, forms the s.e. corner of the kingdom, being contiguous to the Belgian province of the same name. Its surface is generally level, and the soil is poor, a great part of it consisting of moors and marshes. However, in the valleys of the Meuse and its chief tributaries, excellent crops of grain, hemp, flax, oil-seeds, etc., are raised, and cattle and sheep reared. There are many manufactories of gin, tobacco, soap, leather, paper, and glass. The capital is Maestricht (q.v.). Area, 848 English sq.m.; pop. '75, 232,562.

LIMBURG-ON-THE-LAHN. A t. in the duchy of Nassau annexed to Prussia in 1866; seat of the Catholic bishopric of Fribourg; pop. about 5,000. It is one of the most ancient cities of Germany. The "Chronicles of Limbourg," in one of its libraries, is one of the oldest and most important historical manuscripts of Europe. The cathedral of St. George, built in the 13th c. on a crag overlooking the valley of the river, is remarkable for its picturesqueness. Near this town the French gen. Jourdan was defeated by the Austrians in 1796.

LIM'BUS (Lat. *limbus*, a border), the name assigned in Roman Catholic theology to that place or condition of departed souls in which those are detained who have not offended by any personal act of their own, but, nevertheless, are not admitted to the divine vision. They distinguish it into the *limbus patrum* and the *limbus infantium*. By the former name they understand the place of those just who died before the coming of the Redeemer, and of whom it is said (1 Peter iii. 19) that he preached to those spirits that were in prison. By the latter is meant the place or state of the souls of infants who die without baptism. See HELL. Regarding the nature of both these places of detention, great variety of opinion prevails in Roman Catholic schools. See Wetser's *Kirchen-Lexicon*, art. "Höllenfahrt Christi."

LIME is the oxide of the metal calcium (q.v.), and is known in chemistry as one of the alkaline earths. Its symbol is CaO, its equivalent is 28, and its specific gravity is 3.18. In a state of purity it is a white caustic powder, with an alkaline reaction, and so infusible as to resist even the heat of the oxhydrogen jet. See DRUMMOND LIGHT. It

is obtained by heating pure carbonate of lime (as, for instance, Carrara marble or Iceland spar) to full redness, when the carbonic acid is expelled and lime is left. Commercial lime, which is obtained by burning common limestone in a kiln, is usually very far from pure. This compound (CaO) is known as *quicklime*, or, from the ordinary method of obtaining it, as *burned lime*, to distinguish it from the *hydrate of lime* or *slaked lime*, which is represented by the formula CaO,HO. On pouring water on quicklime, there is an augmentation of bulk, and the two enter into combination; and if the proportion of water be not too great, a light, white, dry powder is formed, and a great heat is evolved. On exposing the hydrate to a red heat, the water is expelled, and quicklime is left.

If quicklime, instead of being treated with water, is simply exposed to the air, it slowly attracts both aqueous vapor and carbonic acid, and becomes what is termed *air-slaked*, the resulting compound in this case being a powder which is a mixture (or possibly a combination) of carbonate and hydrate of lime.

Lime is about twice as soluble in cold as in boiling water, but even cold water only takes up about $\frac{1}{700}$ of its weight of lime. This solution is known as *lime-water*, and is much employed both as a medicine and as a test for carbonic acid, which instantly renders it turbid, in consequence of the carbonate of lime that is formed being more insoluble even than lime itself. It must, of course, be kept carefully guarded from the atmosphere, the carbonic acid of which would rapidly affect it. If, in the preparation of slaked lime, considerably more water is used than is necessary to form the hydrate, a white semi-fluid matter is produced, which is termed *milk of lime*. On allowing it to stand, there is a deposition of hydrate of lime, above which is lime-water.

The use of lime in the preparation of mortars and cements is described in the articles on these subjects. Lime is also largely employed as a manure (see below), and in the purification of coal-gas, in the preparation of hides for tanning, for various laboratory processes (from its power of attracting water), etc. Its medicinal uses are noticed below.

The following are the most important of the salts of lime. *Sulphate of lime* (CaO,SO_3) occurs free from water in the mineral *anhydrite*, but is much more abundant in combination with two equivalents of water in *selenite*, and in the different varieties of *gypsum* and *alabaster*. See GYPSUM.

Carbonate of lime (CaO,CO_2) is abundantly present in both the inorganic and organic kingdoms. In the inorganic kingdom it occurs in a crystalline form in Iceland spar, Aragonite, and marble—in which it is found in minute granular crystals—while in the amorphous condition it forms the different varieties of limestone, chalk, etc. It is always present in the ashes of plants, but here it is, at all events, in part the result of the combustion of citrates, acetates, malates, etc., of lime. It is the main constituent of the shells of crustaceans and mollusks, and occurs in considerable quantity in the bones of man and other vertebrates. Carbonate of lime, held in solution by free carbonic acid, is also present in most spring and river waters, and in sea-water. Stalactites, stalagmites, tufa, and travertin are all composed of this salt, deposited from calcareous waters. Certain forms of carbonate of lime—the Portland and other oolites, some of the magnesian limestones, etc.—are of extreme value for building purposes, and the various uses of the finer marbles (q.v.) are too well known to require comment.

There is a combination of lime with an organic acid, viz., oxalate of lime, which is of great importance in pathology as a frequent constituent of urinary calculi and sediments; for a description of it see OXALIC ACID.

The soluble salts of lime (or, more accurately speaking, of calcium) give no precipitate with ammonia, but yield a white precipitate (of carbonate of lime) with carbonate of potash or of soda. These reactions are, however, common to the salts of barium, strontium, and calcium. Solution of sulphate of lime produces no marked effect when added to a salt of calcium, but throws down a white sulphate with the other salts. The most delicate test for lime is oxalate of ammonia, which, even in very dilute neutral or alkaline solutions, throws down a white precipitate of oxalate of lime.

There are several compounds of phosphoric acid and lime, of which the most important is the *basic phosphate of lime*, sometimes termed *bone phosphate*, from its being the chief ingredient of bones. The basic phosphate is represented by the formula $3CaO,PO_5$, and not only occurs in bones, but also in the minerals apatite and phosphorite, and in the rounded nodules termed coprolites, which are found in the Norfolk crag. It forms four-fifths of the ash of well-burned bone, the remaining one-fifth being carbonate of lime. This ash is known as *bone-earth*, and is employed as a manure and in the preparation of phosphorus, etc.

The substance commonly designated as *chloride of lime* has been already described in the article BLEACHING POWDER.

Lime as Manure.—This mineral substance has been used for many centuries as a means of increasing the fertility of land. All crops require a certain amount, as is found by analyzing the ash which remains after combustion. It is sometimes supplied, without previous preparation, in the form of marl and chalk, but in most cases is first calcined and reduced to a fine powder by slaking with water. The quantity of calcined lime applied varies from three to eight tons to the acre. The smaller quantity may be sufficient for light land containing little vegetable matter, while the larger may be

required for strong land, or for land holding much organic matter in an inert state. The large quantity of lime applied shows that its manurial effect is due more to its producing a certain chemical effect on the land than to its affording nutriment to the crops. Lime promotes the decomposition of all kinds of vegetable matter in the soil, and, further, it corrects any acidity in the organic matter, and thus destroys those weeds which are favored by such a condition of the soil. It assists in the decomposition of certain salts whose bases form the food of plants, and in this way it may be said to digest or prepare their food. On certain kinds of land, the finer grasses do not thrive until the land has been limed, and in these cases its use becomes all-important. Lime is the only cure, too, that can be relied on for "finger-and-toe" in turnips, and its use is, from this cause, becoming more general.

Lime-Compounds in Materia Medica.—*Quicklime*, in association with potash, either as the *potassa cum calce*, or as *Vienna paste*, is occasionally used as a caustic. *Lime-water*, mixed with an equal quantity or an excess of milk, is one of our best remedies for the vomiting dependent on irritability of the stomach. From half an ounce to two or three ounces may be thus taken three or four times a day. Its use as a constituent of carron oil in burns is noticed in the article LINIMENTS. *Chalk*, or *carbonate of lime*, when freed from the impurities with which it is often associated, is used as a dusting-powder in moist excoriations, ulcers, etc.; and in the form of *chalk mixture* and *compound powder of chalk*, is a popular remedy in various forms of diarrhœa. A mixture of an ounce of precipitated carbonate of lime and a quarter of an ounce of finely powdered camphor, is sold as *camphorated cretaceous tooth-powder*.

LIME, *Citrus acida*, a fruit similar to the lemon (q.v.), but much smaller, being only about 1½ inches in diameter, and almost globular, with a thin rind, and an extremely acid juice. It is regarded by many botanists as a variety of the same species with the citron and lemon. The plant does not attain the magnitude of a tree, but is a shrub of about 8 ft. in height, with a crooked trunk, and many spreading prickly branches. It is a native of India and China, but has long been cultivated in the West Indies, the s. of Europe, etc. In the West Indies, it is planted both for the sake of its fruit and for hedges. The fruit is used for the same purposes as the lemon; but its acid is by many reckoned more agreeable. Lime-juice is imported into Britain like lemon-juice for the manufacture of citric acid, and it is itself used as a beverage.—The sweet lime (*C. limetta* of Risso), cultivated in the s. of Europe, appears to be a mere variety, probably the result of cultivation, with a sub-acid pulp.

LIME, or LINDEN, *Tilia*, a genus of trees of the natural order *tiliaceæ*, natives of Europe, the n. of Asia, and North America. The species are very similar; graceful, umbrageous trees; with deciduous, heart-shaped, serrated leaves, and cymes or panicles of rather small yellowish flowers; each cyme or panicle accompanied with a large, oblong, yellowish, membranous bractea, with netted veins, the lower part of which adheres to the flower-stalk. The wood is light and soft, but tough, durable, and particularly suitable for carved work. It is much used by turners, and for making pill-boxes. The charcoal made of it is often used for tooth-powder, for medicinal purposes, for crayons, and for the manufacture of gunpowder. The use of the fibrous inner bark for making ropes, mats, and other plaited work, is noticed in the article BAST. It is also used as a healing application to wounds and sores, being very mucilaginous, and abounding in a bland sap. The leaves are in some countries used as food for cattle, but cows fed on them produce bad butter. The flowers have an agreeable odor, and abound in honey, much sought after by bees. The celebrated *Kowno honey*, much valued for medicinal use and for making liqueurs, is the produce of great lime forests near Kowno, in Lithuania. The infusion and distilled water of the dried flowers are gently sudorific and antispasmodic. The former is in France a popular remedy for catarrhs. The seeds abound in a fixed sweet oil.—The EUROPEAN LIME, or LINDEN (*T. Europæa*), often attains a large size, particularly in rich alluvial soils. Some botanists distinguish a small-leaved kind (*T. parvifolia* or *microphylla*) and a large-leaved (*T. grandifolia*) as different species; others regard them as mere varieties. The HOODED or CAPUCHIN LIME is an interesting monstrous variety. The lime tree is often planted for shade in towns; and the principal street of Berlin is called *Unter den Linden*, from the rows of lime trees which line it. The lime is a very doubtful native of Britain, although indigenous on the continent from Scandinavia to the Mediterranean. In Britain, the lime tree is generally propagated by layers.—The AMERICAN LIME (*T. Americana*, or *T. glabra*), commonly called BASSWOOD in America, has larger leaves than the European species. It abounds on the shores of lakes Erie and Ontario. Other species take its place in more western and more southern regions.

LIM'ERICK, an inland co. of the province of Munster, in Ireland, separated by the Shannon on the n. from Clare, and bounded on the e. by Tipperary, on the s. by Cork, and on the w. by Kerry. Its extreme length is 35 m., its breadth 54 m.; area, 1064 sq.m., or 680,842 acres. Pop. '71, inclusive of the city of Limerick, 191,936; of whom 147,389 were Roman Catholics. The county returns two members to parliament. The surface of Limerick is an undulating plain, which forms part of the central carboniferous limestone plain of Ireland. A mountainous district on the w. belongs to the great coal-tract of Munster, but the coal is of an inferior quality, and is chiefly used for the

burning of lime. Within a short distance of the city of Limerick is a quarry which produces a reddish-brown marble of fine quality, as well as a black marble of inferior value. More than one of the districts contains iron, copper, and lead ores; but at present no mining operations are carried on. The soil in general is very fertile, especially the district called the Golden Vale, which comprises upwards of 150,000 acres; as also a portion of the left bank of the Shannon below Limerick. Of the entire acreage of the county, 526,876 acres are arable, and 121,101 unsuited to cultivation. In general the soil is equally fitted for tillage and for pasture. In 1876 172,941 acres were under crops of various kinds, only 858 being reported fallow. In the same year the number of cattle was 200,308; of sheep, 70,000; and of pigs, 66,180. The national schools in 1875 were attended by 37,444 pupils, of whom 36,682 were Roman Catholics.

The principal towns of Limerick are the city of that name, Newcastle, and Rathkeale. Of the secondary rivers, the Deel and the Maigue are the most important. The great highway of water-communication, however, is the Shannon itself, the navigation of which has been much improved, and in which the harbor of Foynes promises to form the nucleus of an extended foreign trade. Limerick communicates by railway with Dublin, Waterford, Cork, and Ennis. The population is chiefly occupied in agriculture, hardly any manufactures existing outside the city. Limerick anciently formed part of the territory of Thomond, the principality of the O'Briens. After the English invasion, it fell, through many vicissitudes, in great part to the Desmond Fitzgeralds—the confiscated estates of the last earl in Limerick contained no fewer than 96,165 acres. On the forfeitures after 1641 and 1690, it was parceled out to new proprietors. Limerick is more than usually rich in antiquities, both ecclesiastical and civil, of the Celtic as well as of the Anglo-Norman period. There were at one time nearly 40 religious foundations of the O'Briens alone, and the ruins of about 100 castles are still in existence. The ecclesiastical remains of Adare are exceedingly interesting, two of the ancient churches having been restored, one as the Protestant, the other as the Catholic parish church. Two other monastic ruins, in very good preservation, form a group of ecclesiastical remains hardly surpassed, in number and picturesqueness, even in the most favored districts of England.

LIMERICK, city, capital of the county just described, is situated on the river Shannon, 120 m. w.s.w. from Dublin, with which it is connected by the great Southern and Western railway. Pop. in '51, 53,448; in '61, 44,626; in '71, 39,353, of whom 18,022 were males, and 21,331 females. More than 90 per cent were Roman Catholics. Limerick is a parliamentary and municipal borough, and returns two members to parliament. It occupies both sides of the Shannon, together with a tract called King's island, which lies on a bifurcation of the river; and is divided into the English town, the oldest part of the city (and connected with the extensive suburb called Thomond Gate, on the Clare side of the Shannon), and the Irish town, which, within the present century, has extended on the s. bank of the river into what is now the best part of Limerick, called the new town, or Newtown Pery, one of the handsomest towns in Ireland. Limerick is a place of great antiquity. From its position on the Shannon, it was long an object of desire to the Danes, who occupied it in the middle of the 9th c., and held possession till reduced to a tributary condition by Brian Boroimhe, in the end of the 10th century. It was early occupied by the English, and in 1210 king John visited and fortified it. It was afterwards assaulted and partially burned in 1314 by Edward Bruce. Its later history is still more interesting. It was occupied by the Catholic party in 1641, but surrendered to Ireton in 1651. At the revolution, it was the last stronghold of king James. Having been unsuccessfully besieged by William after the victory of the Boyne, it was regularly invested in 1691 by gen. Ginkel, and after a vigorous and brilliant defense of several weeks, an armistice was proposed, which led to the well-known "treaty of Limerick," the alleged violation of which has been the subject of frequent and acrimonious controversy between political parties in Ireland. The so-called "treaty stone" still marks the spot, near Thomond bridge, at the entrance of the suburb of Thomond Gate, where this treaty was signed. The modern city of Limerick is more tasteful in its general character, and possesses more of the appliances of commercial enterprise and social culture than most towns of Ireland. Its public buildings, especially the new Roman Catholic cathedral and church of the Redemptorist order, are imposing, and in excellent taste. Its charitable and religious establishments are truly munificent for a provincial town. It possesses several national schools, as well as many other educational institutions. The Shannon at Limerick is still a noble river, navigable for ships of large burden. The docks and quays are on a very extensive and commodious scale; and the export trade is conducted with considerable enterprise. The Wellesley bridge, over the harbor, cost £85,000. The inland navigation is by means of a canal to Killaloe, where it enters lough Derg, and thence by the upper Shannon to Athlone, and by the Grand canal, which issues from the Shannon at Shannon harbor, to Dublin. The manufactures of Limerick are not very extensive, but some of them enjoy not merely an Irish, but an imperial reputation—such are the manufactures of lace, of gloves, and of fish-hooks. There are several iron-foundries, flour-mills, breweries, distilleries, and tanneries, and of late years the ship-building trade has been extended. In 1875 576 vessels, of 138,456 tons, entered, and 354, of 88,811 tons cleared the port.

LIMESTONE, the popular as well as technical name for all rocks which are composed in whole, or to a large extent, of carbonate of lime. Few minerals are so extensively distributed in nature as this, and in some form or other, limestone rocks occur in every geological epoch. Carbonate of lime is nearly insoluble in pure water, but it is rendered easily soluble by the presence of carbonic acid gas, which occurs in a variable quantity in all natural waters, for it is absorbed by water in its passage through the air as well as through the earth. Carbonate of lime in solution is consequently found in all rivers, lakes, and seas. In evaporation, water and carbonic acid gas are given off, but the carbonate of lime remains uninfluenced, becoming gradually concentrated, until it has supersaturated the water, when a precipitation takes place. In this way are formed the stalactites which hang icicle-like from the roofs of limestone caverns, and the stalagmites which rise as columns from their floors. Travertine (Tiber-stone), or calcareous tufa, is similarly formed in running streams, lakes, and springs, by the deposition of the carbonate of lime on the beds or sides, where it incrusts and binds together shells, fragments of wood, leaves, stones, etc. So also birds' nests, wigs, and other objects become coated with lime in the so-called petrifying wells, as that at Knaresborough. From the same cause, pipes conveying water from boilers and mines often become choked up, and the tea-kettle gets lined with "fur."

While water is thus the great store-house of carbonate of lime, very little of it, however, is fixed by precipitation, for in the ocean evaporation does not take place to such an extent as to permit it to deposit, besides there is five times the quantity of free carbonic acid gas in the water of the sea that is required to keep the carbonate of lime in it in solution. Immense quantities of lime are nevertheless being abstracted from the sea to form the hard portions of the numerous animals which inhabit it. Crustacea, mollusca, zoophytes, and foraminifera are ever busy separating the little particles of carbonate of lime from the water, and solidifying them, and so supplying the materials for forming solid rock. It has been found that a large portion of the bed of the Atlantic between Europe and North America is covered with a light-colored ooze, composed chiefly of the perfect or broken skeletons of foraminifera, forming a substance, when dried, which, in appearance and structure, closely resembles chalk. In tropical regions, corals are building reefs of enormous magnitude, corresponding in structure to many rocks in the carboniferous and other formations. The rocks thus organically formed do not always occur as they were originally deposited; denudation has sometimes broken them up to redeposit them as a calcareous sediment. Great changes, too, may have taken place through metamorphic action in the texture of the rock, some limestones being hard, others soft, some compact, concretionary, or crystalline.

The chief varieties of limestone are: *chalk* (q.v.); *oolite* (q.v.); *compact limestone*, a hard, smooth, fine-grained rock, generally of a bluish-gray color; *crystalline limestone*, a rock which, from metamorphic action, has become granular; fine-grained white varieties, resembling loaf-sugar in texture, are called *saccharine* or *statuary marble*. *Magnesian limestone* or *dolomite* (q.v.) is a rock in which carbonate of magnesia is mixed with carbonate of lime. Particular names are given to some limestones from the kind of fossils that abound in them, as nummulite, hippurite, indusial, and crinoidal limestones; and to others from the formation to which they belong, as Devonian, carboniferous, and mountain limestones.

LIMESTONE, a co. in n. Alabama, having the state line of Tennessee for its n. boundary, the Tennessee river for its s., and for its s.w. the Elk river, flowing across the n.w. portion to enter the Tennessee; is drained by various other affluents; 650 sq.m.; pop. '80, 21,600—21,523 of American birth, 9,962 colored. It is intersected centrally from n. to s. by the Nashville and Decatur railroad, and crossed in the s.e. section by the Memphis and Charleston railroad, joining at the Tennessee river. It contains vast quantities of limestone rock, from which the county is named. Its surface is hilly, particularly in the n., and equally divided into prairie and woodland. Cash value of farms in '70, $1,816,510, numbering 1362. Its products are live stock, every variety of grain, tobacco, cotton, wool, sweet potatoes, honey, sorghum, and the products of the dairy. Seat of justice, Athens.

LIMESTONE, a co. in e. Texas, intersected from n. to s. by the Houston and Texas Central railroad; 950 sq.m.; pop. '80, 16,246—15,959 of American birth, 3,171 colored. It is drained by the head waters of the Navasoto river. Its surface is undulating, spreading in sections into broad prairies, with little timber. It has immense quantities of limestone rock, hence its name. Its soil is strong and fertile, producing oats, corn, cotton, wheat, sugar cane, wool, sweet potatoes, and live stock. Cash value of farms in '70, $1,121,390, numbering 483. Seat of justice, Groesbeck.

LIMFIORD. See DENMARK.

LIMITATION, in English law, is the limited time allowed to parties to commence their suits or actions, or other proceedings, so as to shorten litigation. In all civilized countries, some period is prescribed by statute (called statutes of limitations, or prescription) with this view, though few countries adopt the same limit, and Scotland differs much from England and Ireland in this point. In England, suits to recover land must generally be brought within 20 years, and to recover debts (including bills of

exchange) and damages within six years. Actions for assault or battery must be brought within four years, and for slander within two years. In Scotland, prescription is the word generally used for limitation, and actions to recover land generally must be brought within 40 years for many ordinary debts within three years, but for bills of exchange within six years. There are many other differences of detail. See Paterson's *Compendium of English and Scotch Law.*

LIMITATION, in law (*ante*). The "statute of limitations" was passed in the 23d year of James I. (1623), and its provisions have been substantially incorporated into the statutes of the American states. Actions in regard to real property must be brought within 20 years after the right of entry or of action accrues. If the person having such right be under any disability at the time such right accrues, the statute will not run till such disability be removed. An uninterrupted adverse possession for 20 years under a claim of right will bar the real owner of his rights in the property. Such possession must be known to the real owner, either actually or constructively, and must be without his consent; and the claim must be well known, and of a definitely bounded and ascertainable estate. Properly speaking, a mortgager's possession is not adverse to that of the mortgagee, as the relation between them is more in the nature of a tenancy; and such possession is, in the absence of evidence to the contrary, supposed to be permissive. But where either mortgager or mortgagee has been in possession for the statutory time, without any interest being paid or account rendered, and without any acknowledgment of or reference to the rights of the other, the right of the mortgager to redeem or of the mortgagee to foreclose will generally, in the absence of fraud, be barred. The limitation to most personal actions is six years, so that an adverse possession of personal property for six years creates a good title. In the case of slander for words actionable without proof of special damage, the statutory limitation is two years. The statute in all cases begins to run from the time the action accrues; which is, in contracts, upon breach of the same; in trover, the time of the tortious conversion, etc. On a promissory note, the statute begins to run at the expiration of the days of grace if grace be allowed, or on sight, notice, demand, or so many days after, according to the terms of the note. But on a note payable so many days from demand, etc., the demand, etc., must be made within six years. An action begins upon the reception of the writ by the sheriff or deputy, and if the service of the writ be deficient through such officer's fault, or any inevitable accident, an additional time of a year or thereabouts is generally allowed by statute to the plaintiff to bring his action again. In libel and assault and, as has been seen, in slander, the period of limitation is fixed at two years. In many of the United States this latter limit is fixed also for actions against executors and administrators, though in general equity exempts trust, from the operation of the statute. A new promise to pay a debt takes it out of the statute, but such a promise will not prevent the application of the statute to the interest on the principal of such debt.

LIMITED LIABILITY. See JOINT-STOCK COMPANIES, *ante;* and LIABILITY.

LIMITS, THEORY OF. The importance of the notion of a *limit* in mathematics cannot be over-estimated, as many branches of the science, including the differential calculus and its adjuncts, consist of nothing else than tracing the consequences which flow from this notion. The following are simple illustrations of the idea: The sum of the series $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} +$ etc., approaches nearer and nearer to 2 as the number of terms is increased; thus, the several sums are $1\frac{1}{2}$, $1\frac{3}{4}$, $1\frac{7}{8}$, $1\frac{15}{16}$, etc., each sum always differing from 2 by a fraction equal to the last of the terms which have been added; and since each denominator is double of the preceding one, the further the series is extended, the less the difference between its sum and 2 becomes; also this difference may be made smaller than any assignable quantity—say, $\frac{1}{100000}$,—by merely extending the series till the last denominator becomes greater than 100,000 (for this, we need only take 18 terms; 3 terms more will give a difference less than $\frac{1}{1000000}$; and so on); again, the sum of the series can never be greater than 2, for the difference, though steadily diminishing, still subsists; under these circumstances, 2 is said to be the limit of the sum of the series. We see, then, that the criteria of a limit are, that the series, when extended, shall approach nearer and nearer to it in value, and so that the difference can be made as small as we please. Again, the area of a circle is greater than that of an inscribed hexagon, and less than that of a circumscribed hexagon; but if these polygons be converted into figures of 12 sides, the area of the interior one will be increased, and that of the exterior diminished, the area of the circle always continuing intermediate in position and value; and as the number of sides is increased, each polygon approaches nearer and nearer to the circle in size; and as, when the sides are equal, this difference can be made as small as we please, the circle is said to be the limit of an equilateral polygon the number of whose sides is increased indefinitely; or, in another form of words commonly used "the polygon approaches the circle as its limit, when its sides increase without limit," or again, "when the number of sides is infinite, the polygon becomes a circle." When we use the terms "infinite" and "zero" in mathematics, nothing more is meant than that the quantity to which the term is applied is *increasing without limit* or *diminishing indefinitely;* and if this were kept in mind there would be much less confusion in the ideas connected with these terms. From the same cause has arisen the discussion concerning the possibility of what are called vanishing fractions (i.e., fractions

whose numerator and denominator become zero simultaneously) having *real* values; thus $\frac{x^2-1}{x-1}=\frac{0}{0}$, when $x=1$; but by division we find that the fraction is equal to $x+1$, which $=2$, when $x=1$. Now, this discussion could never have arisen had the question been interpreted rightly, as follows: $\frac{x^2-1}{x-1}$ approaches to 2 as its limit, when x continually approaches 1 as its limit, a proposition which can be proved true by substituting successively 3, 2, $1\frac{1}{2}$, $1\frac{1}{3}$, $1\frac{1}{10}$, $1\frac{1}{100}$, etc., when the corresponding values of the fraction are 4, 3, $2\frac{1}{2}$, $2\frac{1}{3}$, $2\frac{1}{10}$, $2\frac{1}{100}$, etc. The doctrine of limits is employed in the differential calculus (q. v.). The best and most complete illustrations of it are found in Newton's *Principia*, and in the chapters on maxima and minima, curves, summation of series, and integration generally, in the ordinary works on the calculus.

LIM'MA, an interval which, on account of its exceeding smallness, does not appear in the practice of modern music, but which, in the mathematical calculation of the proportions of different intervals, is of the greatest importance. The limma makes its appearance in three different magnitudes—viz., the great limma, which is the difference between the large whole tone and the small semitone, being in the proportion of 27 to 25; the small limma, which is the difference between the great whole tone and the great semitone, being in the proportion of 135 to 128; and the Pythagorean limma, which is the difference between the great third of the ancients (which consisted of two whole tones) and the perfect fourth, the proportion of which is as 256 to 243.

LIMNÆ'A (Gr. *limne*, a swamp), a genus of gasteropodous mollusks of the order *pulmonata*, giving its name to a family, *limnæadæ*, allied to *helicidæ* (snails), *limacidæ* (slugs), etc. The species of this family are numerous, and abound in fresh waters in all parts of the world. They feed on vegetable substances. They all have a thin, delicate, horn-colored shell, capable of containing the whole animal when retracted, but varying very much in form in the different genera; being produced into a somewhat elongated spire in the true *limnææ* (POND-SNAILS), whilst in *planorbis* the spire is coiled in the same plane, and in *ancylus* (RIVER LIMPETS) it is limpet-shaped, with a somewhat produced and recurved tip. Many of the *limnæadæ* have a habit of floating and gliding shell downwards at the surface of the water, as may readily be observed in a fresh-water aquarium, in which they are of great use in preventing the excessive growth of confervoids, and removing all decaying vegetable matter. They serve the same purpose in the economy of nature in lakes, ponds, and rivers, and furnish food for fishes. They are hermaphrodite. They deposit their eggs on stones or aquatic plants, enveloped in masses of a glairy substance. The development of the young mollusk may easily be watched in the aquarium, the membrane of the egg being perfectly transparent.

LIMNO'RIA, a genus of crustacea of the order *isopoda*, containing only one known species, which, however, is important from the mischief it does to piers, dock-gates, and other wood-work immersed in the water of the sea, on the coasts of Britain, and of some parts of continental Europe. It is only about a sixth of an inch in length, of an ash-gray color, with black eyes, which are composed of numerous *ocelli*, placed close together. The head is broad. The legs are short. The general appearance resembles that of a small wood-louse, and the creature rolls itself up in the same manner, if seized. The contents of the stomach consist of comminuted wood, and food is the object of the perforation of wood for which the limnoria is notable. Mr. Stevenson found it very troublesome during the operations connected with the building of the Bell rock light-house. The piers at Southampton have suffered greatly from it. The kyanizing of wood and other expedients have been resorted to, to prevent its ravages.

LIMOGES, capital of the department of Haute-Vienne, in France, and of the former province of Limousin, picturesquely situated on a hill in the valley of the Vienne, 67 m. s.e. of Poictiers. It is an ancient city, and the seat of a bishop. It has a cathedral, begun in the 13th c., but still incomplete; a number of scientific and benevolent institutions and public buildings; considerable manufactures of porcelain (employing 2,000 hands), of druggets, of a kind of pack-thread known as Limoges, etc. It was the Augustoritum of the Romans, and afterwards received the name of Lemovica, whence the present Limoges. Before the French revolution it had more than 40 convents. Pop. '76, 55,097.

LIM'ONITE. See HEMATITE, *ante*.

LIMOUSIN, a small province of old France, now comprised in the departments of the Haute-Vienne and Correze, Limoges being the principal town of the former and Tulle of the latter. It is a hilly, elevated plateau, about 1700 ft. above the sea, traversed by spurs or ridges branching from the mountains of Auvergne, and furrowed by numerous small streams having their sources in the hills, and flowing to the bay of Biscay. The surface is mainly granitic, often sterile. The climate is moist and changeable. The poverty of the soil has always enforced continual migrations of its inhabitants, whose peculiar language, allied to the Spanish, always marks their nativity.

LIMOUX (ancient *Limosum*), a t. of France, in the department of Aude, in the center of a fertile valley, on the left bank of the Aude, 52 m. s.e. from Toulouse. There are

manufactures of fine broadcloths, yarn factories, tanneries, dye-works, etc. The neighborhood produces a much-esteemed white sparkling wine, known as *blanquette de Limoux*, which rivals champagne in excellence. Diligences ply regularly to Toulouse, Carcassonne, and Foix. Pop. '76, 6,037.

LIMPET, *Patella*, a genus of gasteropodous mollusks, of the order *cyclobranchiata*, the type of the family *patellidæ*. In all this family the shell is nearly conical, not spiral, and has a wide mouth, and the apex turned forwards. The animal has a large round or oval muscular foot, by which it adheres firmly to rocks, the power of creating a vacuum being aided by a viscous secretion. Limpets live on rocky coasts, between tide-marks, and remain firmly fixed to one spot when the tide is out, as their gills cannot bear exposure to the air, but move about when the water covers them; many of them, however, it would seem, remaining long on the same spot, which in soft calcareous rocks is found hollowed to their exact form. They feed on algæ, which they eat by means of a long ribbon-like tongue, covered with numerous rows of hard teeth; the COMMON LIMPET (*P. vulgaris*) of the British coasts having no fewer than 160 rows of teeth on its tongue, 12 in each row—1920 teeth in all. The tongue, when not in use, lies folded deep in the interior of the animal. The gills are arranged under the margin of the mantle, between it and the foot, forming a circle of leaflets. The sexes are distinct.—The power of adherence of limpets to the rock is very great, so that, unless surprised by sudden seizure, they are not easily removed without violence sufficient to break the shell. The species are numerous, and exhibit many varieties of form and color. The common limpet is most abundant on the rocky coasts of Britain, and is much used for bait by fishermen; it is also used for food. Some of the limpets of warmer climates have very beautiful shells. A species found on the western coast of South America has a shell a foot wide, which is often used as a basin.

LIMPOPO. See OORI.

LINA'CEÆ. See FLAX.

LIN'ACRE, THOMAS, 1460–1524; b. Canterbury; studied at Oxford; became fellow of All Souls' college in 1484; went to Florence and studied Greek and Latin with the ablest teachers; removed to Rome and applied himself to natural philosophy and medicine, studying chiefly the works of Aristotle and Galen, and translating some of Galen's treatises. Returning to England he received the degree of D.D. and the appointment of professor of physic from Oxford university; was called to the court by Henry VII. and made physician and tutor to prince Arthur; was subsequently physician to Henry VII., Henry VIII., and princess Mary. He founded two lectures on physic in the reign of Henry VIII. at Oxford, and one at Cambridge. In 1518, through his influence, the college of physicians in London was founded, and he was its first president, holding the office till his death. With Colet, Lily, Grocyn, and Latymer he restored classical learning in England. Late in life he studied divinity, and was in 1509 rector of Mersham and prebend of Wells; in 1518 was prebend and in 1519 precentor in the church of York. His most celebrated works are his Latin translations from Galen, among which are *De Temperamentis; De tuenda Sanitate; De Methodo Medendi.* His other works are a translation of *Proclus de Sphæra; De Emendata Structura Latini Sermonis Libri Sex.* He was buried in St. Paul's cathedral, where Dr. Caius erected a monument to his memory. In his literary character he held a very high rank, and as a physician his skill was unsurpassed.

LINA'RÉS, a t. of Spain, in the province of Jaen, 24 m. n.n.e. from Jaen. The neighborhood was celebrated in ancient times for its mines of copper and lead, which are still very productive. A fine fountain which adorns the town is supposed to be Roman. Pop. 15,000 to 18,000.

LINCOLN, a co. in s.e. Arkansas, having the Arkansas river, near its confluence with the Mississippi, for its n.e. boundary, is traversed diagonally by the bayou Bartholomew; 600 sq.m.; pop. '80, 9,255—9,198 of American birth, 5,044 colored. Its surface is level; the rich, nutritious grass of its prairies, being shaded for long distances near the water-courses by groves of ash and cypress, affords good pasturage; and the soil produces cotton and corn. It is intersected by the Little Rock, Mississippi River and Texas railway in the n.e. section. Seat of justice, Star City.

LINCOLN, a co. in s.e. Dakotah, having the Big Sioux river for its e. boundary, separating it from Iowa, and for its s.w. border the Vermilion river; about 550 sq.m.; pop. '80, 5,897—4,118 of American birth. It is thinly timbered; its plains producing buckwheat, barley, the products of the dairy, oats, corn, and wheat. Some attention is paid to the raising of live stock. Seat of justice, Canton.

LINCOLN, a co. in n.e. Georgia, having the Savannah river for its north-eastern border, separating it from the state of South Carolina, and Broad river, a tributary of the Savannah, for its northern boundary; is also drained by Little river, its southern and south-eastern boundary line; 300 sq.m.; pop. '80, 6,412—6,405 of American birth, 4,157 colored. Its surface is hilly, comprising large tracts of woodland; the quality of the soil varying in different sections, producing in the most favorable localities wine, sweet potatoes, wool, oats, wheat, cotton, and Indian corn, and offering fine pasturage for

stock. It produced in '70, 1865 lbs. of honey. It contains vast quantities of granite; gold is found, iron ore, and a kind of slate used for hones. It had in '78, 1 gold quartz mine, employing 11 men, with a capital of $30,000 and annual product of $7,000. Seat of justice, Lincolnton.

LINCOLN, a co. in n. Kansas, watered by the Saline river, an affluent of the Kansas river, is also drained by Wolf creek and affluents of the Soloman river; 720 sq.m.; pop. '80, 8,582. Its surface spreads out into limitless fertile plains, in many portions covered with timber, in others sinking into salt marshes or rising into low hills. Magnesia is a component part of the limestone that forms the foundation of the soil, which produces corn, wheat, wool, dairy products, and affording fine pasturage is well adapted to the raising of stock. Seat of justice, Lincoln.

LINCOLN, a co. in s. Kentucky, watered by Dicks river, an affluent of the Kentucky, and the head-waters of Green river, is intersected by the Knoxville line of the Louisville and Nashville railroad, forming a junction at its county seat, in the n.e. section, with the Richmond and Stanford branch; also the Cincinnati Southern in the w. and s.; 400 sq.m.; pop. '80, 15,079—14,992 of American birth, 3,908 colored. Its surface is hilly and thinly timbered; its soil, of a calcareous formation, producing the blue grass of the prairie, flax, maple sugar, sorghum, sweet potatoes, tobacco, wool, corn, rye, wheat, and the products of the dairy. It produced in '70, 10,730 lbs. of honey. Cattle, sheep, and swine are raised. Cash value of farms in '70, $4,002,549, numbering 597, including one of 1000 acres. It had in '70, 64 manufacturing establishments, with a capital of $90,350, and an annual product of $258,677. Among its industries are the manufacture of woolen goods, saddlery, and harness. It has distilleries, saw mills, and steam grist mills. Seat of justice, Stanford.

LINCOLN, a parish in n.w. Louisiana, formed 1873; is drained by the head-waters of the Dugdemona river, the Saline bayou, the bayou d'Arbonne, and numerous affluents of the Washita river; about 550 sq.m.; pop. '80, 11,075—11,048 of American birth, 4,900 colored. It is composed of portions of the counties of Bienville, Jackson, Union, and Claiborne. Its surface is uneven, and its soil has all the elements of fertility. Seat of justice, Vienna.

LINCOLN, a co. in s. Maine, having numerous inlets of the Atlantic ocean, which lies on its s. boundary, has the Kennebec river, navigable 44 m. from its mouth, for its s.w. border; 500 sq.m.; pop. '80, 24,809—24,330 of American birth, 46 colored. It is drained by the Sheepscot river, flowing through it from n. to s., emptying into the ocean not far from Bath. It has also Damariscotta lake, smaller lakes in the extreme n., Damariscotta river, the outlet of the lake, navigable by the largest ships, and the bays of its southern border. Its surface rises into long, high hills that sink into deep valleys. It is thinly timbered, and the soil under cultivation is very fertile, producing every variety of grain, wool, dairy products, honey, and maple sugar. Cattle, sheep, and swine are raised. Its commercial facilities are unsurpassed, its harbors being spacious, safe, and accessible. Much attention is paid to fishing, steamboats being used, with which large quantities of fish are taken with the seine, and pressed into oil in establishments for that purpose. It has also curing and packing establishments. Among its industries are ship-building and repairing, the manufacture of machinery, bricks, matches, lumber, sails, and wool; it has also wool-carding and cloth-dressing mills, and steam saw and flour mills. Cash value of farms in '70, $4,488,419, numbering 3,197. It had in '70, 309 manufacturing establishments, employing 1332 hands, with a capital of $587,280, and an annual product of $1,018,705. It is traversed near the coast by the Knox and Lincoln railroad from Rockland to Bath. It has an active coast trade, and ice is largely exported to southern ports. Seat of justice, Wiscassett.

LINCOLN, a co. in s.w. Minnesota, having the state line of Dakotah for its western boundary, is intersected in the extreme n.e. by the Winona and St. Peter railroad; about 540 sq.m.; pop. '80, 2,945—1876 of American birth, 2,942 colored. It is watered by the Yellow Medicine river, other tributaries of the Minnesota river, by lake Benton, 8 m. long, in its southern section, and a few smaller lakes. Its surface is level in the n., and rough and hilly in the extreme south. It has a fertile soil. Seat of justice, Marshfield.

LINCOLN, a co. in s.w. Mississippi, drained by the head-waters of the Bogue Chitto, a confluent of Pearl river, is intersected centrally by the Chicago, St. Louis and New Orleans railroad; 600 sq.m.; pop. '80, 13,547—13,407 of American birth. Its surface is level and is diversified by fertile plains and immense forests of magnolia, beech, and useful timber. Its soil is adapted to the production of live stock, rice, oats, corn, tobacco, cotton, wool, sweet potatoes, wine, honey, sugar cane, and the products of the dairy. It had in '70, 44 manufacturing establishments, employing 175 hands, with a capital of $92,332, and an annual product of $152,737. Seat of justice, Brookhaven.

LINCOLN, a co. in e. Missouri, having the Mississippi for its eastern boundary, separating it from Illinois, is drained by the Cuivre river; 600 sq.m.; pop '80, 17,443—16,606 of American birth, 2,144 colored. It is watered by Eagle fork and Big creek. Its surface is hilly and liberally supplied with building timber. Its soil, having an understratum of limestone, is very fertile in the valleys, being adapted to the raising of live stock, tobacco, every variety of grain, wool, sweet potatoes, dairy products, sorghum,

maple sugar, and flaxseed. It produced in '70, 17,172 lbs. of honey. Cash value of farms in '70, $5,133,736, numbering 2,129, including 4 of 1000 acres and over. Value of live stock in '70, $1,387,573. It had in '70, 94 manufacturing establishments, with a capital of $111,120, and an annual product of $270,285. Among its manufactories are flour and saw mills, tanneries, leather currying establishments, plow factories, tobacco factories, wool-carding and cloth-dressing mills. Seat of justice, Troy.

LINCOLN, a co. in s. Nebraska, having the North Platte river for its northern boundary, is traversed by the Republican river; about 2,592 sq.m.; pop. '80, 3,632—3,032 of American birth, 6 colored. Its surface is level and poorly timbered. The soil of the famous Platte valley is light and eminently productive, affording excellent facilities for stock raising. It is intersected by the Union Pacific railroad. Among its manufactories are breweries, cheese factories, and the railroad repair shops. Seat of justice, North Platte.

LINCOLN, a co. in s.e. New Mexico, organized 1869; having the state line of Texas for its e. boundary; traversed by the Pecos, the Rio Bonito, and numerous small streams; 13,000 sq.m.; pop. '70, 1803—1686 of American birth. Cash value of farms in '70, $139,770, numbering 368, none under 10 acres or over 500. Its surface is equally divided into mountain and prairie, with few trees, the eastern portion being a part of the great Staked Plain and the w. occupied by ranges of the White mountains and the Gaudalupe. Its soil when irrigated is fertile, and produces wheat, Indian corn, barley, and oats. It is largely taken up by Indian reservations, but has much tillable land. Seat of justice, Lincoln.

LINCOLN, a co. in w. North Carolina, having the Catawba river for its eastern border, is intersected centrally by one of its branches called the Little Catawba; 250 sq.m.; pop. '80, 11,061—11,051 of American birth, 2,881 colored. Its surface is uneven and equally divided into tillable lands, and hard-wood forests. It contains valuable deposits of iron ore. Gold is found in the eastern portion and on the banks of the Little Catawba. Its soil is fertile and adapted to the raising of buckwheat, oats, corn, rye, wheat, tobacco, cotton, wool, sweet potatoes, wine, honey, sorghum, flax, live stock, and the products of the dairy. It had in '70, two mining establishments of iron ore, employing 40 hands, with a capital of $43,000, and an annual product of $8,800. It had in '70, 65 manufacturing establishments, employing 294 hands, with a capital of $184,625, and an annual product of $319,025. Its industries are represented by manufactories of paper, cotton goods, pig iron, etc. Seat of justice, Lincolnton.

LINCOLN, a co. in s. Tennessee, having the state line of Alabama for its southern boundary, is traversed by the Elk river, and has the terminus of the Decherd to Fayetteville line of the Nashville, Chattanooga, and St. Louis railway, at its co. seat; 720 sq.m.; pop. '80, 26,960—26,900 of American birth, 6,316 colored. Its surface is uneven, well wooded with locust, poplar, and tulip trees, and hard-wood useful for building purposes. Its soil is fertile, producing maple sugar, sorghum, wool, sweet potatoes, tobacco, cotton, every variety of grain, and the products of the dairy. It produced in '70, 1,233,960 bushels of corn, and 44,838 lbs. of honey. Cash value of farms in '70, $6,521,190, numbering 3,393, including one of 1000 acres. It had in '70, 185 manufacturing establishments, employing 507 hands, with a capital of $223,236, and an annual product of $772,959, utilizing its valuable water-power. Among its industries are the manufacture of cotton yarn, woolen goods, saddlery and harness, and leather, and it has saw and flour mills. Seat of justice, Fayetteville.

LINCOLN, a co. in s.w. West Virginia, having the Coal river, an affluent of the Kanawha river for its eastern boundary, is drained in its western portion by the Guyandotte river, the Caney fork in the south-western, and other affluents of the Ohio and Kanawha rivers; 400 sq.m.; pop. '80, 8,739—8,723 of American birth, 52 colored. Its surface is mountainous, well provided with building timber and presents scenery of great beauty. It is watered by the Mud river, running at the base of the mountains, and parallel with them. The soil of the river bottoms is very rich, and is generally founded on carboniferous rock. Iron is abundant. Its products are buckwheat, oats, corn, rye, wheat, flax, maple sugar, tobacco, wool, honey, and sorghum. Cattle, sheep, and swine are raised. Seat of justice, Hamlin.

LINCOLN, a co. in s. Ontario, Canada, having lake Ontario for its n. boundary; intersected in the eastern section by the Welland canal; bounded on the e. by the Niagara river and the Erie and Niagara railroad, running parallel with the river for 28 m. from the town of Niagara to the International bridge, and is intersected by a branch of the Great Western railroad, running along the border of the lake, and crossing the canal to connect with the line to Niagara Falls; 321 sq.m.; pop. '71, 29,547. Its manufactories consist of foundries and machine shops, sewing-machine factories, soap and candle works, tanneries, woolen mills, breweries, flour and saw and planing mills. Ship building and repairing is among its industries, its ports having excellent shipyards. Seat of justice, St. Catherines.

LIN'COLN (called by the Romans *Lindum;* from which, with *Colonia* subjoined, comes the modern name), a city of England, capital of the county of the same name, a parliamentary and municipal borough and county of itself, is situated on the Witham,

140 m. n.n.w. of London by railway. Built on the slope of a hill, which is crowned by the cathedral, the city is imposing in effect, and can be seen from a very considerable distance. It is very ancient, is irregularly laid out, and contains many interesting specimens of early architecture. The cathedral, one of the finest in England, is the principal building. It is surmounted by three towers, two of which, 180 ft. in height, were formerly continued by spires of 101 feet. The central tower, 53 ft. square, is 300 ft. high. The interior length of the cathedral is 482, the width 80 feet. The famous bell called Tom of Lincoln was cast in 1610, and was hung in one of the w. towers of this edifice. It was broken up, however, in 1834, and, together with six other bells, was recast to form the present large bell and two quarter bells. The present bell, which hangs in the central tower, is 5 tons 8 cwt. in weight; and is 6 ft. 10½ in. in diameter at the mouth. The style of the cathedral, though various, is chiefly early English. Lincoln also contains many other interesting religious edifices, among which are three churches, dating from before the reformation, etc., numerous schools, and benevolent institutions. Several iron foundries and manufactories of portable steam-engines and agricultural machines, as well as large steam flour-mills, are in operation here, and there is an active trade in flour. Brewing and machine-making, with a trade in corn and wool, are also carried on. Two members are returned to the house of commons for the city. Pop. '61, 20,999; '71, 26,766.

Lincoln, under the Romans, was a place of some importance, and under the Saxons and the Danes it preserved a good position. It was the seat of an extensive and important trade at the time of the Norman conquest; but its advancement since that time has not been equally rapid. It contains some very interesting antiquities, as the Roman gate, the remains of the palace and stables of John of Gaunt, and the town-hall.

LINCOLN, the capital t. of Logan co., Ill., near Salt creek, on the Chicago and Alton railroad, where it crosses the Indianapolis, Bloomington and Western railroad; also, on the Pekin branch of the Wabash railroad; 28 m. n.n.e. of Springfield, and 157 m. s.s.w. of Chicago. Pop. 5,000. It is the seat of Lincoln university (Cumberland Presbyterian), and of the state institution for feeble-minded children. The place contains 11 churches, 2 or 3 banks, a high school, a court-house, and manufactories of farm implements; also 1 daily and 4 weekly newspapers. Coal is mined in the neighborhood.

LINCOLN, a city, the capital of Nebraska and of the co. of Lancaster, situated at the junction of several branches of Salt creek; lat. about 40° 50′ n., long. 96° 45′ west. It is 66 m. s.w. of Omaha, and 168 m. n.w. of Leavenworth, Kansas, and lies upon the Nebraska or Midland Pacific, where it crosses the Burlington and Missouri river railroad, and is besides the n.w. terminus of the Atchison and Nebraska railroad. It was made the capital of the state in 1867; pop. about 10,000. It is surrounded by beautiful undulating prairies, and fine building sites abound in its neighborhood. It is regularly laid out; the 17 avenues running n. and s. bear numerical names, while the cross-streets bear the names of the letters of the alphabet. The avenues are 120 ft. and the streets 100 ft. wide. Among the public buildings are the state-house (built of light-colored limestone), the state asylum for the insane (built of sandstone, and costing $136,000), the penitentiary (built of limestone at a cost of $312,000), the state library, an opera-house, a high-school, the Nebraska state university and agricultural college (open in all departments to students of both sexes), and 10 churches. The city has two national and several other banks; two daily, one semi-weekly, and three weekly newspapers. In the near vicinity are abundant saline springs, from which large supplies of salt are obtained.

LINCOLN, ABRAHAM, sixteenth president of the United States was b. in Kentucky, Feb. 12, 1809. His grandfather was an emigrant from Virginia; his father, a poor farmer, who, in 1806, removed from Kentucky to Indiana. In the rude life of the backwoods, Lincoln's entire schooling did not exceed one year, and he was employed in the severest agricultural labor. He lived with his family at Spencer co., Indiana, till 1830, when he removed to Illinois, where, with another man, he performed the feat of splitting 3,000 rails in a day, which gave him the popular *sobriquet* of "the rail-splitter." In 1834 he was elected to the Illinois legislature. At this period he lived by surveying land, wore patched homespun clothes, and spent his leisure hours in studying law. He was three times re-elected to the legislature; was admitted to practice law in 1836; and removed to Springfield, the state capital. In 1844 he canvassed the state for Mr. Clay, then nominated for president. Mr. Clay was defeated, but the popularity gained by Lincoln in the canvass secured his own election to congress in 1846, where he voted against the extension of slavery; and in 1854 was a recognized leader in the newly formed republican party. In 1855 he canvassed the state as a candidate for United States senator against Mr. Douglas, but without success. In 1856 he was an active supporter of Mr. Fremont in the presidential canvass which resulted in the election of Mr. Buchanan. In 1860 he was nominated for the presidency by the Chicago convention over Mr. Seward, who expected the nomination. The non-extension of slavery to the territories, or new states to be formed from them, was the most important principle of his party. There were three other candidates—Mr. Douglas of Illinois, northern Democrat; Mr. Breckenridge of Kentucky, then vice-president, and afterwards a general of the confederate army, southern democrat; and Mr. Bell of Tennessee, native American. With this division, Mr.

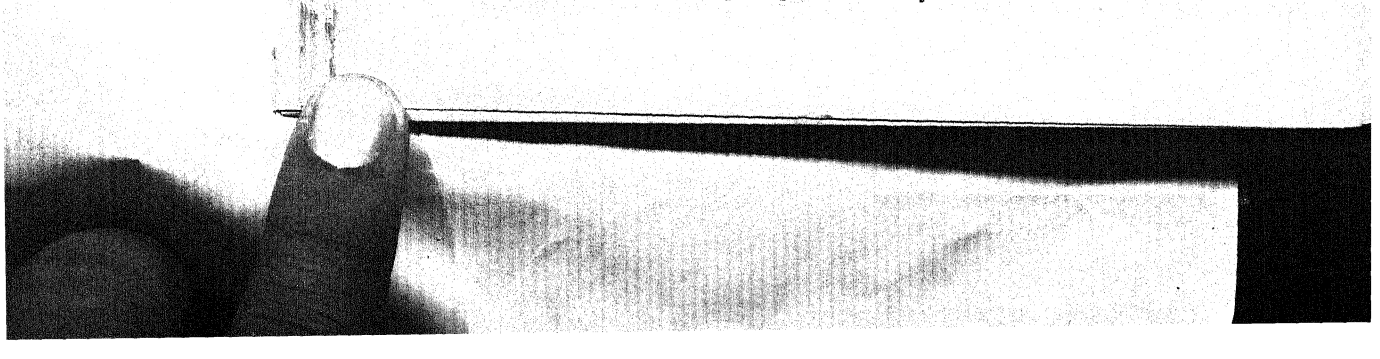
Lincoln received a majority of votes over any of the other candidates, though a million short of an absolute majority; every southern and one northern state voted against him. He was installed in the president's chair, Mar. 4, 1861. His election by a sectional vote and on a sectional issue hostile to the south, was followed by the secession of 11 southern states, and a war for the restoration of the union. As a military measure, he proclaimed, Jan. 1, 1863, the freedom of all slaves in the rebel states; and was re-elected to the presidency in 1864. The war was brought to a close, April 2, 1865; and on the 15th of the same month, Lincoln was cut off by the hand of an assassin. See the Lives by Lamon (vol. i. 1870) and Leland (1879).

LINCOLN, ABRAHAM (*ante*), the 14th elected president of the United States, serving the 19th term of 4 years; b. in Hardin co., Ky., Feb. 12, 1809; his father being Thomas Lincoln, who married Nancy Hawks. The family was of English descent, and early among the settlers of Virginia. Whether the family was connected with the Lincolns of Massachusetts is not known. The birthplace of the war-president was no paradise. Kentucky was the rendezvous of tories, runaway conscripts, deserters, debtors, and criminals of all kinds. Thomas Lincoln was a restless, thriftless man, living by jobs of carpentry and other work, until finally, deciding to try farming, he settled down in a wretched cabin near a spring of good water, but in a barren region. In that humble cabin Abraham was born. The boy was fond of fishing and hunting, but at an early age he began to grow serious, and of himself to develop the moral training which became so conspicuous in after-life. With his sister he traveled to a humble school four miles away. In 1816 Thomas Lincoln had a serious difficulty with a neighbor, the result of which was his emigration to Ohio in the autumn of that year, transporting his household goods on a rude flat-boat, and losing almost everything by the capsizing of the craft. Saving a few tools and the greater portion of his whisky, he brought up in Posey co., Ind., sold his boat, and chose a location in the wilderness in Perry county. With much difficulty he brought his family there, consisting of his wife Nancy, a daughter 9 years old, and Abraham, aged seven. Here in Oct., 1818, Abraham's mother died. The widower 13 months afterwards married a widow with whom he had been in love before he married Nancy Hawks. The new wife was a good step-mother to little Abraham and his sister (whose name was changed from Nancy to Sarah), although she brought a son and two daughters of her own. She found her step-children dirty and poorly clad, for they had been sadly neglected; but, being a woman of energy, a speedy and thorough reformation followed her advent. She took kindly to Abraham, and her love continued to the day of his death. She encouraged him in his studies, and all was harmonious and happy in the mixed family. It was not to his real mother but to his step-mother that Lincoln, in after years, so often referred as "saintly" and an "angel," who first made him feel like a human being, whose goodness first touched his childish heart, and taught him that blows and taunts and degradation were not always to be his portion in this life. He had but little chance for schooling, but that little was well improved. He grew in height amazingly, and before his 17th birthday was at his maximum of 6 ft. 4 in., wiry and strong, with enormous hands and feet, greatly disproportionate length of legs and arms, and over all a rather small head; his skin was yellow and shriveled, and his complexion swarthy. He wore coarse home-made clothes, and a coon-skin cap; his trousers, owing to his rapid growth, were nearly a foot too short. But this awkward, overgrown boy was always in good humor, and always in good health. While at school he was noted as a good speller, but more particularly for his abhorrence of cruelty—his earliest composition being a protest against putting coals of fire on the backs of captured terrapins. His last attendance at school was in 1826, when he was 17 years old. He worked at odd jobs, and one of his employers says "Abe was awful lazy; he would laugh and talk and crack jokes and tell stories all the time; he didn't love work." He would lie under a tree or in the loft of the house, and at night sit in the firelight to read, cipher, and scribble on the wooden fire-shovel. He read everything readable within his reach, and copied passages or sentences that especially attracted him. His reading, however, included little more than *Robinson Crusoe*, *Pilgrim's Progress*, *Weems's Life of Washington*, and a *History of the United States*. His step-mother said that the Bible was one of his favorite books. His first knowledge of the law, in which he afterwards became eminent, was through reading the statutes of Indiana, borrowed from a constable. He had a strong memory and a taste for speaking in public. In 1825 he worked 9 months on a ferry over the Ohio river, receiving a salary of $6 per month. His first venture in the great outside world was as assistant navigator of a flat-boat down the Ohio and the Mississippi to New Orleans, returning in June, 1828. In 1830 the Lincolns emigrated to Illinois, Abraham being the driver of a wagon hauled by 4 yoke of oxen. A few days after their arrival at their destination near Decatur, Lincoln became of age, and at once determined to make his own way in the world. The story of his making rails is fixed at this period, but it is apocryphal, and the "Illinois rail-splitter" was a misnomer. In this period Lincoln got a tolerable knowledge of grammar from a borrowed book, studied by the light of burning shavings in a cooper's shop. In 1832 came the Black Hawk Indian war, and Lincoln enlisted in a company at Sangamon and was chosen captain; but there were no remarkable acts done by him during the campaign.

In 1832, the year of Jackson's second election as president, Lincoln made his first appearance in politics as a candidate for the state assembly on the following platform: "I presume you all know who I am; I am humble Abraham Lincoln. I have been solicited by many friends to become a candidate for the legislature. My politics are short and sweet, like the old woman's dance. I am in favor of a national bank; I am in favor of internal improvements, and a high protective tariff. These are my sentiments and political principles. If elected I shall be thankful; if not, it will be all the same." This was straight whig doctrine. Lincoln made a good canvass, but he was not elected. His next venture was as a partner in a dry goods and grocery store at New Salem, but the concern failed, the partner fled, and Lincoln was left to settle up a losing business, paying all he owed in 1849. Having no faculty for trade, he now began to read in law, studied hard, and made rapid progress. Then he suddenly studied surveying, and tried his hand with compass and chain. In May, 1833, he was appointed postmaster at New Salem—compensation, next to nothing. He was not able to hire a room, and was said to have "carried the post-office in his hat." The mails came once a week, and their burden was light. In 1834 Lincoln's personal property was about to be sold by the sheriff to satisfy a judgment; but a new friend, James Short, bid in the property and gave it over to him. In 1834 he was again a candidate for the legislature, and was elected, running far ahead of his ticket. The party now had assumed the name of whig, and he soon became a whig leader. His first love episode was painfully sad. While boarding with James Rutledge, in New Salem, he became enamored of Ann, his landlord's daughter, a well-educated girl of 17, who had at the time another lover, who promised marriage, but did not keep his word. Lincoln and Ann Rutledge were betrothed in 1835, but the girl's health failed, and in August she died of brain fever. Her loss made Lincoln almost insane, and he raved piteously. "I can never bear to have snow, rain, and storm beat upon her grave," and "in her grave my heart lies buried," he cried out. It was at the time of her death that he took a liking to the poem by an English writer, the rev. Vicesimus Knox, commencing "Oh, why should the spirit of mortal be proud," lines that he was never weary of quoting; indeed, he repeated them so often that many people supposed him to be the author.

On taking his place in the legislature, Lincoln first saw Stephen A. Douglas, with no idea that he would be his competitor for the highest office in the nation. In 1836 Lincoln was again a candidate for the legislature on the following characteristic platform: "I go for all sharing the privilege of the government who assist in bearing its burdens. Consequently I go for admitting all whites to the rights of suffrage who pay taxes or bear arms, by no means excluding females." With the opposition candidate Lincoln stumped the district, as was then the custom, and by his vigorous speeches secured a whig victory, the first ever known in Sangamon county. Lincoln and Douglas were both chosen; but Douglas served only one session, and the next year was nominated for congress. In the presidential contest in 1836 Lincoln was for Hugh L. White of Tennessee, but the "hard cider" campaign of 1840 found him vociferous for Harrison and Tyler. With the struggle of Jackson against the U. S. bank and the shifting policy of Van Buren, Lincoln had no interest, attending diligently to his duties as a legislator, and beginning that antislavery record upon which so much of his fame will ever rest. The abolitionists were in the highest activity. George Thompson had just gone back to England after stirring up the small but enthusiastic party in this country; Garrison's *Liberator* was intensely annoying to the supporters of slavery; there was a great anti-abolitionist meeting in Boston; and president Jackson had, at the close of 1835, invited the attention of congress to the circulation through the mails of what were then called "inflammatory" documents. Henry Clay, Edward Everett, many of the governors of the northern states, and a large majority of the house of representatives strenuously opposed the agitation of the slavery question; all petitions on the subject were laid on the table without reading or debate, and all possible means were taken to prevent the discussion of the annoying subject. Illinois did not escape, though none of her citizens desired to establish or even uphold slavery. On the night of Nov. 7, 1837, the rev. Elijah P. Lovejoy was mobbed and shot dead at Alton for persisting in publishing an abolition newspaper. At this juncture, when the legislature was about to pass resolutions deprecating the antislavery agitation, Lincoln presented his protest, to which he could get but one signer besides himself, in which he declares slavery to be founded on injustice and bad policy; but that abolition agitation tends to increase its evils; that congress cannot interfere with slavery in the states, but might in the District of Columbia on the request of the people. This protest was meant to avoid extreme views, and so no mention was made of slavery in the territories, that point being covered by the Missouri compromise, which was then in full force. Lincoln was never extreme, and probably till the war began he saw no hour when he would have altered a word in this protest. When the state capital was removed to Springfield in 1839, Lincoln established himself there. He had been licensed as an attorney two years before, and being at the capital he could attend both to his duties as a member of the legislature and his legal practice. His business grew rapidly, and he took into partnership John T. Stuart, a prominent whig, who had been a kind friend in former years, Lincoln preferring to be the junior in the firm. Springfield was a poor village of about 1500 inhabitants; and Lincoln was poor, indeed much in debt. It is said that his friend Bill Butler fed and

clothed him for several years. In Jan., 1837, he delivered an oration on "The Perpetuation of our Free Institutions," whose eloquence greatly added to his fame. In Dec., 1839, Lincoln, on behalf of the whigs, challenged the other side to a joint debate, and Douglas and three other democrats were pitted against Lincoln, Logan, and two other whigs. The intellectual struggle between Lincoln and Douglas is still known as "the great debate;" and Lincoln was acknowledged to have had the best of the arguments. In 1840 Lincoln was an elector on the Harrison ticket, and made speeches in all parts of the state. But one-sided speeches were not suited to his temper; he preferred joint debates, where he could employ his masterly skill at retort. For twenty years (1838 to 1858) he followed Douglas, who was nearly always ready to accommodate him with a discussion. They fought their battles over and over, until one became president of the United States and the disappointment of the other had been buried in the grave a few months after Lincoln's inauguration. About 1839 Lincoln made the acquaintance of Mary, the daughter of hon. Robert S. Todd, of Lexington, Ky. They were engaged to be married; the day was set, and the supper made ready, but Lincoln failed to appear; he had gone quite crazy, and remained so for a year. His friend Speed took him to Kentucky, where he was kept until he had recovered his reason. In honorable fulfillment of his promise he married Miss Todd, Nov. 4, 1842. Mrs. Lincoln was a politician and a satirical writer of rare power. She wrote for the local papers and very soon involved her husband in a duel with Mr. Shields, then state auditor. Shields challenged Lincoln and they met in Missouri, but affairs were explained and the fight did not come off. In 1844 Lincoln was again an elector on the Clay (whig) ticket, and labored hard, but in vain for that great statesman. A handful of votes cast in New York for Birney, the abolition candidate, being a subtraction from the whig strength, gave the vote of that state to Polk and defeated and politically killed Clay. In 1846 Lincoln was elected to congress by 1511 majority in a district which, two years before, gave him only 914. He took his seat at the opening of the 30th congress, Robert C. Winthrop being speaker. In that house he was the only whig member from Illinois, with such democrats to watch him as John Wentworth, William A. Richardson, John McClernand; and Stephen A. Douglas in the senate. "There were giants in those days" in congress, such on the whig side as John Quincy Adams, Horace Mann, Washington Hunt, Jacob C. Collamer, Joseph R. Ingersoll, John M. Botts, Caleb B. Smith, Alexander H. Stephens, Robert Toombs, Samuel H. Vinton, and Robert C. Schenck; of democrats, Wilmot of Penn., McLane of Md., McDowell of Va., Rhett of S. C., Cobb of Ga., Boyd of Ky., Thompson of Miss., and George W. Jones and Andrew Johnson of Tenn. In the senate were Webster, Calhoun, Benton, Berrien, Clayton, Bell, Hunter, and W. R. King. Lincoln was put on the committee on post-offices and post-roads. He was opposed to the Mexican war, but voted for supplies to carry it on. In 1848 he favored the nomination of Taylor (whig) for president, and made a strong political speech in the house for that purpose, subsequently speaking in various parts of the country. In the second session of the 30th congress he made no especial mark. His law partnership with Stuart ended, April, 1841, when he united in practice with ex-judge Stephen T. Logan, and soon afterwards formed a partnership with his best friend, William H. Herndon. Dec. 3, 1839, Lincoln was admitted to practice in the federal courts, on the same day with Stephen A. Douglas. Many curious anecdotes are told of the great story-teller, of his power, his energy, his oddities, and his generosity. He was for a time counsel for the Illinois Central railroad company, by whom he was badly treated. In 1859 he went to Cincinnati to argue the McCormick reaper case and found Edwin M. Stanton one of his colleagues; but Stanton treated him with such discourtesy that it seems remarkable that Lincoln ever made the haughty Edwin a member of his cabinet. Lincoln wanted to be commissioner of the general land-office, but did not get the appointment. He was offered the governorship of Oregon territory, but his wife declined to go there, and he would not accept. For two years after leaving congress he was not publicly prominent. In 1850 he refused a nomination for congress; July 1, 1852, he was selected at a meeting of citizens to deliver a eulogy on Henry Clay. The bill offered by Douglas, Jan. 4, 1854, to establish a territorial government in Nebraska reopened the antislavery war, and Lincoln was forced to take decided ground against the extension of slavery into the territories, which he did at the state fair at Springfield in Oct. in a speech of great power. Douglas was there, chafing like a tiger under the scathing remarks of his great opponent. He endeavored to reply, but was too much excited to speak coherently. He promised to conclude in the evening, but did not appear. Other contests between the two followed, but they finally agreed to give up joint discussion. In Nov., in spite of his positive declination, Lincoln was again elected to the legislature. At the same time he was very desirous to succeed Shields (democrat) in the U. S. senate; but Lyman Trumbull carried off the prize. During the Kansas excitement Lincoln's sympathies were all in favor of the free-state side, but he discountenanced the use of force. In 1856 he said to the force party: "I agree with you in Providence; but I believe in the providence of the most men, the largest purse, and the largest cannon. You are in a minority—a sad minority—and cannot hope to succeed, reasoning from all human experience. You would rebel against the government, and redden your hands in the blood of your countrymen. If you are in the minority, as you are, you cannot succeed. Your attempt to resist the law of Kansas by force is criminal and wicked, and



all your feeble attempts will be follies, and end in bringing sorrow on your heads, and ruin the cause you would freely die to preserve."

It was at the state convention at Bloomington in 1856 that the republican party in Illinois was formed, and there Lincoln made what is considered by many the greatest of all his speeches. Up to this time he had argued the slavery question on the ground of policy, never reaching to the radical right of the matter. At Bloomington he was baptized to freedom; he was newly born, and had all the fervor of a fresh convert; his heart was alive to the right; he felt justice; the flame, smothered for years, broke out; his sympathies burst forth, and then and there he unburdened his penitential soul. A hearer said of the speech: "It was fresh, new, odd, original, filled with fervor and enthusiasm; it was full of fire, energy, and force, of great truths and the sense of right; it was justice and equity set ablaze by the force of the soul; it was hard, heavy, knotted, gnarled, and heated." From that hour to the night of his murder slavery had no more persistent opponent than the man whom slavery assassinated. On June 17, 1856, in the first Republican national convention at Philadelphia, Lincoln's name was put forth for vice-president, and was received with considerable favor; but Wm. L. Dayton was selected, having 259 votes to 110 for Lincoln and 180 scattering. This year, for the third time, Lincoln was on the electoral ticket, now as a republican, and spoke and worked for Fremont's success. All this time the Kansas question was prominent, and in the close of the long struggle it became to Lincoln the passport to the presidency through the pertinacity of Douglas in sticking to his idea of "squatter (or popular) sovereignty." This split the democratic party in 1860, and made Lincoln's success certain. In 1858 he made a speech at the republican state convention for the purpose of securing a nomination for U. S. senator. His friends were surprised, and nearly all agreed that the speech was injudicious and would ruin his prospects. In this speech he foreshadowed Seward's "irrepressible conflict." One of Lincoln's nearest friends says: "I think the speech was intended to take the wind out of Seward's sails" (for the nomination for president). The state was thoroughly canvassed by Douglas and Lincoln; the democrats carried both branches of the legislature; Douglas was re-elected U. S. senator, and Lincoln was bitterly disappointed. When asked how he felt, he said "like the boy who stubbed his toe; it hurt too bad to laugh, and he was too big to cry."

In the winter of 1858–59 Lincoln appeared as a lecturer, starting with Adam and Eve for subject, and coming down to the "invention of negroes and the present mode of using them." Parts of the lecture were witty or humorous, but on the whole it was commonplace; his friends were mortified, and he soon gave up the lecturing business. In April, 1859, the people of his own town began to talk of Lincoln as a proper candidate for president, but he discouraged the idea. In Sept. he made speeches in Ohio in the track of Douglas; in Dec. he spoke at several places in Kansas. He was more and more talked of for a presidential nomination, and finally authorized his friends to work for him. Feb. 25, 1860, on invitation, he appeared in New York to deliver a speech. He spent that day (Saturday) in revising the speech; on Sunday went to hear Mr. Beecher preach; on Monday wandered over the city, and finally delivered his speech in Cooper Institute. The address was warmly praised in most of the city journals, and was in fact highly successful, After this he spoke in many cities in New England. He was present, though not a delegate, at the Illinois state convention, May 9, 1860, where he received the most flattering evidences of his great popularity, which was fully assured by the adoption without dissent of a resolution declaring him the choice of the republicans of Illinois for president, and instructing the delegates to the Chicago convention to use all honorable means to secure his nomination.

On May 16, 1860, the republican national convention met at Chicago. The city was full of political workers, and no previous convention had half the number of "outside delegates." Two days were spent in organization and the adoption of a platform, and balloting came on the third day. Up to the previous evening Seward's nomination seemed certain; but the outside pressure for Lincoln was powerful, for his friends were chiefly men of Illinois, and the convention was held in their state. On the first ballot the vote was: Seward, 173½; Lincoln, 102; Cameron, 50½; Chase, 49; Dayton, 14; McLean, 12; Collamer, 10; and six scattering. On the second ballot: Seward, 184½; Lincoln, 181; Chase, 42½; Bates 35; Dayton, 10; McLean, 8. On the third trial Lincoln got the nomination, and in the afternoon Hannibal Hamlin of Maine was nominated for vice-president. Lincoln was at Springfield, evidently very nervous. When he learned the result of the second ballot he felt sure of success. Then came news of the triumph, which he received without special emotion, and after shaking hands with a few friends said: "Gentlemen, there is a little short woman at our house who is probably more interested in this dispatch than I am; if you will excuse me I will take it up and let her see it." On the following day a committee of the convention made a formal tender of the nomination, which Lincoln accepted in a very brief speech:

"Imploring the assistance of divine providence, and with due regard to the views and feelings of all who were represented in the convention; to the rights of all the states and territories, and the people of the nation; to the inviolability of the constitution and the perpetual union, harmony, and prosperity of all, I am most happy to co-operate for the practical success of the principles declared by the convention."

The democratic national convention at Charleston split on the slavery question. The South totally repudiated Douglas and his squatter sovereignty, while Douglas was equally determined to stick to it. Most of the Southern delegates withdrew and organized a separate convention. Those who remained voted 57 times for a candidate, Douglas always having the highest number, but not the two-thirds required by democratic precedent. They adjourned to meet at Baltimore June 18. The seceders adjourned to meet at Richmond on the first Monday of June, but on that date further adjourned to meet June 28 in Baltimore. The result finally was the nomination of three presidential candidates; Douglas by his convention, Breckinridge of Kentucky by the seceders, or extreme southerners, and Bell (formerly a whig) of Tennessee by the "constitutional union" party, composed for the most part of "know-nothings" and old-time whigs. The canvass was warm on all sides; and Douglas, encouraged by the result of the spring elections, felt certain of victory. Election day was Nov. 6, when by far the largest vote ever cast in the union was given. Lincoln got 1,857,601; Douglas, 1,291,574; Breckenridge, 850,082; and Bell, 646,124; Lincoln lacked 930,170 of a majority, but the electoral vote told a different story, being 180 for Lincoln, 72 for Breckinridge, 30 for Bell, and only 12 for Douglas.

Lincoln felt deeply the responsibility of his great trust, and still more keenly the difficulty of administering the government for the sole benefit of an organization which had no existence in one-half of the union. He was anxious to take prominent southerners, such as Alexander H. Stephens, and Gilmore of North Carolina, into his cabinet; but they refused all such advances. Secession was determined upon, and events tending to that end followed rapidly. Nov. 10, only four days after the election, a bill was proposed in the South Carolina legislature to equip 10,000 volunteers, a U. S. senator from that state resigned, and a state convention was ordered to consider the question of secession. During that month and the next, senators and officers of the army resigned; secession meetings and conventions were held; the South accumulated arms and enlisted troops; and Dec. 20 the South Carolina convention unanimously adopted an ordinance seceding from the union. The year closed in gloom, and 1861 opened with no hope of peace. On Feb. 4 a peace congress met in Philadelphia; on the same day delegates met at Montgomery, Ala., to form a southern confederacy, and on the 18th the work was done, and Jefferson Davis was inaugurated president. In the mean time Lincoln was making his way towards Washington. After an affectionate parting with his mother who said she was sure she would never see him again, he put his house in order, handed over the law business to his partner, with a request that the old sign should remain for four years at least, and on Feb. 1 the arrangements for the journey were completed. He bade farewell to his life-long friends in a brief and touching address, and turned his face toward the mighty responsibilities soon to be thrown upon him. Everywhere the people were anxious to see and hear him, and he made brief addresses at Indianapolis, Columbus, Cleveland, Pittsburg, before the New York legislature, in New York (in response to the mayor), in Trenton, Philadelphia, and Harrisburg. While at Philadelphia there came rumors of a threatened attack upon his life; bridges were to be burned, tracks torn up, torpedoes exploded, and all manner of weapons were to be drawn against one of the most peaceful men in all the country. The great mass of this menace was sheer bravado, yet his friends (not himself) deemed it proper to take extra care. On the morning of Washington's birthday Lincoln raised the old flag over Independence hall in Philadelphia, and immediately proceeded to Harrisburg. Here he was taken in charge by a few picked friends and the leading railroad officers, and early the next evening quietly went from his hotel to a special train for Washington. He wore no disguise; but changed his stiff hat for a soft one, and threw on a shawl to conceal his features if necessary. At Philadelphia he was quietly transferred to the Baltimore railroad, reached Baltimore at 3½ A.M., passed unnoticed, and was safe in Washington at 6 o'clock. His family followed in another train. His secret and safe arrival caused much comment, and he himself quickly regretted that he had not traveled openly in sight of all the people; he felt that he had laid himself open to the charge of cowardice. Almost the first news he heard was the surrender of gen. Twiggs in Texas, a great gain to the secessionists. Lincoln was inaugurated on Monday, Mar. 4, and delivered an elaborate address, full of the best qualities of his nature. Ex-president Buchanan accompanied him to the White House and invoked peace and happiness for his administration. The appearance of the new president is thus described by Ward Lamon in his *Life of Abraham Lincoln:* "He was 6 ft. 4 in. high, the length of his legs being out of all proportion to that of his body. When he sat on a chair he seemed no taller than an average man, measuring from the chair to the crown of his head; but his knees rose high in front. He weighed about 180 lbs., but was thin through the breast, narrow across the shoulders, and had the general appearance of a consumptive subject. Standing up, he stooped slightly forward; sitting down, he usually crossed his long legs or threw them over the arms of the chair. His head was long, and tall from the base of the brain and the eyebrow; his forehead high and narrow, inclining backward as it rose. His ears were large and stood out; eyebrows heavy, jutting forward over small sunken blue eyes; nose long, large, and blunt; chin projecting far and sharp, curved upward to meet a thick lower lip, which hung downward; cheeks flabby, the loose skin falling in folds; a mole on one cheek, and an uncommonly prominent Adam's apple in his throat. His hair

was dark brown, stiff, and unkempt; complexion dark, skin yellow, shriveled, and leathery. Every feature of the man—the hollow eyes, with the dark rings beneath, the long, sallow, cadaverous face, intersected by those peculiar deep lines, his whole air, his walk, his long and silent reveries, broken at intervals by sudden and startling exclamations, as if to confound an observer who might suspect the nature of his thoughts—showed that he was a man of sorrows, sorrows not of to-day or yesterday, but long-treasured and deep, bearing with him continual sense of weariness and pain." Yet this strangely sorrowful man dearly loved jokes, puns, and comical stories, and was himself world-famous for his inimitable narrative powers. He drank very little, and was in precept and example a temperance man; and at table always ate sparingly. He was never a member of a church; he is believed to have had philosophical doubts of the divinity of Christ, and of the inspiration of the Scriptures as these are commonly stated in the systems of doctrine called evangelical. In early life he read Volney and Paine, and wrote an essay in which he agreed with their conclusions. Of modern thinkers he was thought to agree nearest with Theodore Parker.

Mr. Lincoln took the executive chair in a dark and stormy time. Vast preparations for war had been made in the south, and, except with him and a few still hopeful men, a contest was looked upon as inevitable. In his inaugural address he said that he should "take care that the laws of the union be faithfully executed in all the states;" adding, "I trust this will not be regarded as a menace. There need be no bloodshed or violence, and there shall be none unless it be forced upon the national authority. The power confided to me will be used to hold, occupy, and possess the property and places belonging to the government, and to collect the duties and imposts; but, beyond what may be necessary for these objects, there will be no invasion, no using of force against or among the people anywhere. Physically speaking, we cannot separate, we cannot remove our respective sections from each other, nor build an impassable wall between them. A husband and wife may be divorced, and go out of the presence and beyond the reach of each other; but the different parts of our country cannot do this. They cannot but remain face to face; and intercourse, either amicable or hostile, must continue between them. Is it possible, then, to make the intercourse more advantageous or more satisfactory after separation than before? The chief magistrate derives all his authority from the people; and they have conferred none upon him to fix terms for the separation of the states. His duty is to administer the present government as it came into his hands, and to transmit it unimpaired by him to his successor. In your hands, my dissatisfied fellow-countrymen, and not in mine, is the momentous issue of civil war. You can have no conflict without being yourselves the aggressors. You have no oath registered in heaven to destroy the government, while I shall have the most solemn one to preserve, protect, and defend it." In fact he denied the right of any state or number of states to go out of the union. The confederates considered this address to amount to a declaration of war, and hastened their preparations. In the north the address united and consolidated the people in support of its views. Less than six weeks afterwards, gen. Beauregard, on behalf of the confederate government, demanded the surrender of Fort Sumter in Charleston harbor, then garrisoned by a small force under maj. Robert Anderson. The surrender being refused, the fort was attacked April 12, 1861, and thus actual hostilities begun. That act united the people of the north; party lines were broken down, and, with the exception of a few extreme proslavery men (afterwards known as "copperheads"), the whole people echoed the words of Jackson when South Carolina made her first attempt at secession—"The union must and shall be preserved." Maj. Anderson abandoned the fort on the 14th. The next day president Lincoln called a special session of congress to meet on the 4th of July; at the same time he called for 75,000 militia. The response was instantaneous. Massachusetts, with her sixth regiment, was first in the field. This regiment was attacked while going through Baltimore, and a number of its members were killed. On April 19 the president proclaimed the blockade of all the ports of the seceding states. The south was even more inflamed than the north; three days after the fall of Sumter the Virginia legislature voted to join the confederacy, and a few days later North Carolina followed her example. The confederates had raised 100,000 men, and made no secret of their design to capture the national capital and invade the north. On May 30 another call for men was issued by Lincoln, and both the army and the navy were speedily and largely reinforced. In a brief message to congress the president rehearsed the acts of rebellion, and said: "This issue embraces more than the fate of these United States. It presents to the whole family of man the question whether a constitutional republic or democracy—a government of the people by the same people—can or cannot maintain its territorial integrity against its own domestic foes." Some opposition was made in congress by members who thought it unconstitutional to "coerce a sovereign state," but the loyal sentiment overwhelmed them. July 15 a democratic member (McClernand of Ill.) offered a resolution pledging the house to vote any amount of money and any number of men necessary to suppress the rebellion and restore the authority of the government. There were only five opposing votes in a house of nearly 300 members. On July 21 the union forces were very badly defeated at Bull Run, and driven in a panic back upon Washington. The news gave the northern people a terrible shock, but it was only momentary, and its ultimate effect was to rouse to the highest pitch the patriotism and courage of the loyal states, and

volunteers came by thousands and thousands without waiting for a call. Up to the last of Oct. gen. Scott retained his position as commander of the army; but he was growing feeble, and was retired, gen. McClellan taking his place. The army was reorganized, new troops were drilled, and the whole force was soon in good discipline. But McClellan was loath to fight; though entirely loyal, he inclined to act with the moderate men on both sides, and whenever it seemed necessary to strike directly at slavery in order to sustain the republic he was not the man or the officer to do it. McClellan remaining inactive until near the end of Jan., 1862, the president, on the 27th of that month, ordered that on Feb. 22 a general movement by land and sea should be made against the confederates. McClellan objected, and nothing was done until at a council of war, held Mar. 13, it was decided to move against Richmond from fortress Monroe. Here again McClellan waited and hesitated, complaining that he was not properly supported at Washington, and after a number of battles, in which the unionists were generally beaten, he was forced to abandon the campaign and retreat. The close of the summer of 1862 was a dark period for loyal men, but no one suffered so keenly or worked so faithfully as did president Lincoln. The confederates now took the aggressive; Lee invaded Maryland, but was soon driven out after the first union victory at Antietam. To follow up this victory, McClellan was ordered to follow Lee and fight him or drive him southward. Again McClellan delayed, and finally broke the long-enduring patience of Lincoln, who removed him from command, Burnside taking his place. Battles with Lee followed at Fredericksburg and Chancellorville, in both cases unfortunate for the unionists. The people of the north began to feel that it was time to strike the rebellion in a vital part, and the emancipation of the slaves in the south was urged upon Lincoln, not only as a legitimate, but as a vitally necessary war-measure. He hesitated; thought such an act would drive the border slave states, still nominally loyal, into the confederacy. Again, what if the emancipated negroes should be taken into the confederate army? He said to the men who were urging the emancipation idea and adding that they felt sure it was the will of God: "I hope it will not be irreverent for me to say that, if it is probable that God would reveal his will to others on a point so connected with my duty, it might be supposed he would reveal it directly to me, for, unless I am more deceived in myself than I often am, it is my earnest desire to know the will of Providence in this matter; and if I can learn what it is, I will do it." In reference to the position of the slave-holding states still in the union he said: "There are 50,000 bayonets in the union army from the border slave states. It would be a serious matter if, in consequence of a proclamation such as you desire, they should go over to the rebels." Lincoln carefully sought the opinion of the northern people in the matter, and soon found that he would be sustained in the action questioned. Thus fortified he issued, on Monday, Sept. 22, 1862, the most important official document, the declaration of independence only excepted, known in American history; declaring that on and after Jan. 1, 1863, all slaves in states or parts of states then in rebellion should be free. Two years afterwards Lincoln said of the proclamation: "As affairs have turned it is the central act of my administration, and the great event of the 19th century." After the conflict at Chancellorville the current of success seemed to favor the union arms, leading on to the great event of July 4, 1863—the capture of Vicksburg by gen. Grant. At the same time the three-days' battle between the unionists under Meade and the confederates under Lee was going on near Gettysburg, resulting in a decisive union victory. Lincoln soon saw in Grant the man for the occasion, and in Mar., 1864, in compliance with the recommendation of congress, the captor of Vicksburg was appointed lieut.gen. of the armies of the United States. This sealed the fate of the rebellion. The rebels had fought long and bravely; but their resources failed, their losses were enormous, and those who lived were worn out. Sherman, almost unopposed, marched through an empty country to the sea; Grant, who knew no such word as fail, had set himself to the capture of Richmond, and would "fight it out on this line if it takes all summer." We need not follow details when the catastrophe is so near. On April 2, 1865, Lee was forced out of Richmond (then the confederate capital), and seven days afterwards was compelled to surrender his whole army to Grant at Appomattox. On the 17th, eight days later, gen. Joe Johnston surrendered to Sherman and the great struggle was ended; in fact, it ended with the surrender of Lee. Grant reached Washington on the 13th, met the president and secretary of war, and orders were prepared to stop the raising of recruits. The war was over and every loyal heart was rejoicing. Lincoln's praise was on every tongue; the patient man who had suffered the pain of a thousand deaths during the war; who had been misunderstood, maligned, and condemned, by friends as well as enemies, now shone conspicuous in popular affection. He had liberated a race; he had saved his country. On the evening of April 11 the White House was illuminated, and Lincoln made a short address expressing his acknowledgments to the army, and his gratitude to God, and then turning his remarks to reconstruction, the cardinal points of which he thought would be to grant universal amnesty on condition that the states lately in rebellion should grant universal suffrage. Lincoln and Grant were the idols of the hour. On the morning of the 14th they were invited to visit Ford's theater in the evening. Grant left the city, but the president, though not at all inclined, attended with his wife, and maj. Rathbone and Miss Harris. They went into a private box, and Lincoln was soon absorbed in the

play (*Our American Cousin*). At about 11:30 o'clock the box was suddenly invaded by John Wilkes Booth, an actor and a furious pro-slavery man. In an instant he put a pistol to the back of Lincoln's head and fired; then leaped from the box to the stage, crying, "*Sic semper tyrannis!* The south is avenged!" and fled through the stage door, mounted a horse, and escaped. The president did not stir; the ball had gone through his brain, and he had no further consciousness. He died the next morning about half-past seven. On the same evening an attempt was made to murder secretary Seward, who was confined to his house in consequence of an accident. It would be vain to attempt to describe the sorrow that spread over the nation, and even other nations, on hearing of this awful tragedy. The assassin was captured and executed, and some of his confederates shared the same fate. It is satisfactory to know that this act of infamy was the work of a gang of private men, and that the confederate government and leaders had no hand in it. Thus, when Lincoln

> Had mounted fame's ladder so high,
> From the round at the top he could step to the sky,

the great president passed to his rest. Twice elected to his high office—the last time (in Nov., 1864) over gen. McClellan by a popular majority of more than 400,000—he was torn from it in the moment of triumph to be placed side by side with Washington, the one the father, the other the savior of the union; one the founder of a republic, the other the liberator of a race.

LINCOLN, BENJAMIN, 1733–1810; b. Hingham, Mass. Until the age of 40 he was a farmer, but had filled the positions of local magistrate, representative in the colonial legislature, and col. of militia. In 1774–75 he took an active part in organizing the provincial militia for active resistance to the mother country, and was appointed maj.gen. of the Massachusetts militia. At the siege of Boston Washington put him in command of an expedition to force the British fleet out of Boston harbor. He commanded the Massachusetts militia at the battle of White Plains in the fall of 1776; reinforced Washington by a fresh levy of Massachusetts militia at Morristown, N. J., Feb., 1777; and by Washington's request was made a maj.gen. in the continental army, Feb. 19 of that year. He co-operated with gen. Schuyler in the summer campaign against Burgoyne in New York, and again organized reinforcements of New England militia for the army. In Sept. he joined gen. Gates as second in command, and was disabled by a wound Oct. 8 at the battle of Bemis Heights, near Saratoga. He resumed service in Aug., 1778, and in Sept. was assigned to the command of the southern army. His command of this division of the army was rather to strengthen the faltering allegiance of the Carolinas and Georgia to the cause of the states by a show of strength than for offensive operations. D'Estaing, admiral of the French fleet, was to co-operate with him near the coast. He arrived at Charleston Dec. 4, 1778, and maintained a defensive watch of the English forces. His army met with reverses at Brier creek and Stone ferry in Mar. and June, and, acting in conjunction with D'Estaing with a view to retake Savannah from the British, the combined forces met with a sanguinary repulse Oct. 9; and the following spring his army was besieged in Charleston and forced to capitulate May 12, 1780. He returned to his home prisoner on parole. Exchanged in the spring of 1781, he joined Washington before Yorktown, and was chosen by Washington to receive the sword of lord Cornwallis on his surrender. He held the office of secretary of war for three years, and retired to his farm at Hingham in 1784. Gen. Lincoln after this held various temporary positions of trust under the state of Massachusetts and the United States. In 1789 he was made collector of the port of Boston, which position he held till his death at the age of 87. He was a man of simple earnest character; and the persevering zeal and disinterestedness of his public service gave him great popularity in his native state and in New England. His services in organizing and drawing opportunely into service the militia of the several states were of great value, and so recognized by Washington.

LINCOLN, ENOCH, 1788–1829; son of Levi Lincoln (1749–1820); b. in Worcester, Mass.; studied at Harvard college; entered the legal profession in 1811, and settled at Fryeburg, Me., from which place he removed to the neighboring town of Paris in 1819. He was a member of congress from 1818 to 1826, and governor of Maine in 1827–29. During his residence at Fryeburg he described the beautiful scenery of that forest-town in a poem entitled *The Village*. He also delivered a poem at the centennial celebration of the fight at Lovewell's pond. He left historical manuscripts of value, some of which have been published in the first volume of the *Maine Historical Collections*.

LINCOLN, JOHN LARKIN, b. in Boston, 1817; professor of Latin in Brown university; editor of *Selections from Livy* (1847); the *Works of Horace* (1851); and Cicero's *De Senectute*.

LINCOLN, LEVI, 1749–1820; b. at Hingham, Mass., and graduated at Harvard in 1772; became a lawyer and settled at Worcester in 1775; was judge of probate in 1776; and served in the constitutional convention of 1780. In 1798 he was elected to congress as a political disciple of Jefferson, serving but for a single term. From 1801 to 1805 he was attorney-general of the United States; in 1807–8, lieutenant-governor of Massachusetts; and acting-governor in 1809. He declined an appointment as judge of the supreme court of the United States. Died at Worcester.

LINCOLN, LEVI, LL.D., 1782–1868; son of Levi Lincoln (1749–1820); b. in Worcester, and graduated at Harvard in 1802; entered the legal profession in 1805; served in the constitutional convention of 1820; often a member of the legislature, speaker of the house in 1822, president of the senate in 1845; elected lieutenant-governor of Massachusetts in 1823, and was governor from 1825 to 1834; was a member of congress from 1835 to 1841; a judge of the state supreme court in 1824; collector of the port of Boston from 1841 to 1843; and first mayor of Worcester in 1848.

LINCOLN COLLEGE, OXFORD, was founded in 1427 by Richard Fleming, bishop of Lincoln, for a rector and 7 fellows, and afterwards greatly augmented by Thomas Rotherham, bishop of Lincoln, archbishop of York, and lord high chancellor of England, who added 5 fellowships, and gave a new body of statutes in 1479, in which the election of fellows was limited to the dioceses of Lincoln, York, and Wells. These limitations were abolished, however, by an act of parliament, 17 and 18 Vict. The foundation at present consists of a rector, 10 fellows, and 14 scholars. Other scholarships are added from time to time from the proceeds of two suspended fellowships; 12 were founded by Dr. Hutchins, lord Crewe, bishop of Durham, and Dr. Radford, rectors. The patronage consists of 9 benefices, in the counties of Oxford, Lincoln, Essex, Dorset, and Bucks, of the annual value of £5,414. This college has usually between 250 and 300 members on the books.

LINCOLNSHIRE, a maritime county of England, and, after Yorkshire, the largest in the country, is bounded on the n. by Yorkshire, and on the e. by the North sea. Area, 1,767,962 statute acres; pop. '71, 436,599. The coast, from the Humber—which separates the county from Yorkshire on the n.—to the Wash, is almost uniformly low and marshy; so low, indeed, in one part—between the mouths of the Welland and the Nen—that the shore here requires the defense of an embankment from the inroads of the sea. Lincolnshire has long been divided into three districts, or "parts," as they are called—viz., the parts of Lindsey, an insular district, forming the north-eastern portion of Lincolnshire, and including the Wolds or chalk hills, which are about 47 m. in length by 6 m. in average breadth; the parts of Kesteven, in the s.w.; and the parts of Holland, in the s.e., including the greater part of the fens. Chief rivers, the Trent, the Ancholme, the Witham, and the Welland. The surface is comparatively level, with the exception of the Wolds in the north-east. The soil, though very various, is on the whole very fertile. It includes tracts of grazing-ground unsurpassed in richness, and the "warp-lands" (see WARPING) along the side of the Trent produce splendid crops of wheat, beans, oats, and rape without the aid of manure. No other county in England has finer breeds of oxen, horses, and sheep. Horncastle and Lincoln horse-fairs are frequented by French, German, Russian, and London dealers for the purpose of buying superior hunters and carriage-horses. The climate, though subject to strong westerly winds, is much the same as that of the other central counties of England. Six members are returned to parliament.

LINCOLN'S INN, one of the four English inns of court, having exclusive power to call persons to the bar. It is so called because it belonged to the earl of Lincoln in the reign of Edward II., and became an inn of court soon after his death in 1310. See INNS OF COURT.

LIND, JENNY. See GOLDSCHMIDT, MADAME.

LINDAU, a t. of Bavaria, built on islands in the lake of Constance; pop. about 5,000; the center of a small commerce in hops, wine, fish, and cheese. Its manufactures are mechanical and musical instruments, carriages, etc. In the 7th c. it was a well-known Roman town, and a free imperial city until 1803.

LIN'DE, SAMUEL BOGUMIL, 1771–1847; of Swedish descent; b. at Thorn, Prussia; studied at Leipsic; spent several years in Dresden and Vienna; and in 1803 was appointed director of the lyceum of Warsaw, where he died. His *Dictionary of the Polish Language,* in 6 vols., is highly esteemed.

LINDEN (tree). See LIME, *ante.*

LINDLEY, DANIEL, D.D., b. Penn.; graduated at the Ohio university, of which his father was president; taught school to pay his way through the Union theological seminary of Virginia, where he graduated in 1829; was immediately licensed to preach by the presbytery. For three years he preached in Charlotte, N. C., and saw several hundred added to the church. When an appeal was made by the American board for settled pastors to become missionaries, he offered his services. He married Lucy Allen of Richmond, Va., and sailed in 1834 for the cape of Good Hope. From Cape Town they journeyed by wagons 500 m. to Griqua Town, thence the next year 500 m. farther to Mosika, the country of Mosilikatse. After encountering great peril and suffering in the war between the Dutch and Mosilikatse, reduced almost to starvation, they reached Port Natal, whence shortly they were driven by war between the Dutch and Dingaan, great-uncle of Cetywayo. In June, 1839, he returned to Port Natal, where he labored among the Zulus for about thirty-five years. Not only did he make known to them Jesus Christ, but when the native Christians wished to improve their modes of life, though not a mechanic, he could show them how to make brick, to build houses, to construct a few implements and pieces of furniture. In sickness he ministered to them; if a tiger or

a lion threatened, his rifle never missed its aim; though he was neither physician nor sportsman. The Zulus honored and loved him. The Dutch Boers, whose wanderings he had shared when war drove him from his home and work among the natives, said, "If there be a human name that warms the heart of a Natal Teck Boer, it is the ever-to-be-remembered name of Daniel Lindley." He died at Morristown, N. J., Sept. 3, 1880.

LINDLEY, JOHN, a distinguished botanist, was b. Feb., 1799, at Catton, near Norwich, where his father, who was the author of *A Guide to Orchard and Kitchen Gardens*, owned a large nursery garden. Botany seems to have early attracted his attention, as, in 1819, he published a translation of Richard's *Analyse du Fruit*, and in 1820 his *Monographia Rosarum* appeared. Amongst his most important works are his *Introduction to the Natural System of Botany* (1830); *Introduction to the Structure and Physiology of Plants* (2 vols. 1832); *Flora Medica* (1838); and *The Vegetable Kingdom* (1846), which is a standard work on the subject of classification, and is an expansion of his *Introduction to the Natural System*, which had previously (in 1836) been remodeled under the title of *A Natural System of Botany*. Lindley did a great deal to popularize the study of botany by the publication of his *Ladies' Botany*, *School Botany*, "botany" in the *Library of Useful Knowledge*, and the botanical articles as far as the letter R in the *Penny Cyclopædia*. In his *Theory of Horticulture*, which has passed through several editions, and in the well-known periodical, *The Gardener's Chronicle* (the horticultural department of which he edited from its commencement in 1841), he showed the great practical value of a knowledge of vegetable physiology in the common operations of the field and garden. In conjunction with Mr. Hutton he published *The Fossil Flora of Great Britain*, which consists of descriptions and figures of all the fossil plants found in this country up to the time of the commencement of this publication in 1833. Our limited space prevents us from noticing his other works, or his numerous contributions to scientific transactions. In 1829, at the opening of the London university, he was appointed professor of botany, and he continued to discharge the duties of the chair till 1860, when he resigned. From 1822 he acted as assistant secretary to the horticultural society, and not only edited their Transactions and Proceedings, but took an active part in the management of their gardens at Turnham Green. He was a fellow of numerous learned societies at home and abroad. He died Nov., 1865.

LINDSAY, county-seat of Victoria co., Ontario, Canada, on the Scugog river, and on the line of the Canada Midland railway, 56 m. n.e. of Toronto; pop. about 4,000. Its commerce is principally in lumber, grain, and flour. Its manufactures are doors, sash and blinds, iron-works, beer, and extracts of hemlock bark. It contains the county buildings, and several fine churches and schools.

LINDSAY, THE FAMILY OF. This Scottish historical house is of Norman extraction. One of the race obtained lands in England from the Conqueror; another, sir Walter de Lindsay, settling in Scotland under David I., acquired Ercildoun, and Luffness in East Lothian. The descendant of the latter, William Lindsay of Ercildoun, high justiciary of Lothian in the latter half of the 12th c., acquired the lands of Crawford in Clydesdale, which the family continued to hold till about the close of the 15th century. He married princess Marjory, sister of king William the lion, and had three sons. The eldest inherited Crawford; and the descendants of the second were the house of Lamberton, who for a time eclipsed their elder brethren; but the line of both ended in heiresses; and Crawford eventually came to the descendants of William of Luffness, third son of the justiciary, who, in the 14th c., added largely to their estates by marriage with a coheiress of lord Abernethy. Sir James Lindsay of Crawford was one of the most notable of the Scotch barons engaged in the battle of Otterburn.

EARLS OF CRAWFORD AND DUKE OF MONTROSE.—Sir Alexander Lindsay, younger brother of sir James of Crawford, the hero of Otterburn, acquired large estates in the counties of Angus and Inverness by marriage with the heiress of Stirling of Glenesk and Edzell; and his son David, who, on failure of the line of his uncle, became chief of the family, married the sister of Robert III., and was raised by that king, in 1398, to the dignity of earl of Crawford. In the 15th c. the earls of Crawford were among the most powerful of the Scotch nobility: they assumed a regal state, had their heralds, and were attended by pages of noble birth. Their domains were widely extended over Scotland, but their chief seat was Finhaven, in Angus. David, third earl, entered into an alliance, offensive and defensive, with the eighth earl of Douglas and Macdonald of the Isles, earl of Ross, and wielded for a time, during James II.'s minority, an authority far exceeding that of royalty. He was slain at Arbroath in a private feud with the Ogilvies. His son, nicknamed "Beardie," or the "tiger earl," renewed the league with Douglas. On James having treacherously stabbed Douglas at an interview at Stirling, he rose in rebellion; and the earl of Huntly, lieut.gen. of the kingdom, who had aided the Ogilvies at Arbroath, took up arms against him. Earl Beardie was defeated at Brechin, and forfeited; but he was afterwards restored to his lands and dignities, and to royal favor, and entertained James at Finhaven, who flung down a loose stone from the castle battlement in fulfillment of a vow which he had taken to make the highest stone of the castle the lowest. The family attained their climax of power and wealth under David, fifth earl, a faithful friend of James III., and employed by him in his most important foreign embassies, who was made duke of Montrose in 1488, a title which had never before been

bestowed in Scotland but on princes of the blood-royal. On the accession of James IV., an act rescissory was passed of all grants and titles conferred by his predecessor during the last eight months of his reign; but soon afterwards, a new charter of the dukedom of Montrose was granted on a recital of the duke's good services to the king and his predecessor. David, eighth earl of Crawford, nephew of the duke of Montrose, had the misfortune to have a son known for his crimes and enormities as "the wicked master"; his conduct led his aged father to consent to a transfer of the earldom to David Lindsay of Edzell, the next heir. The ninth earl, who succeeded under this conveyance, moved with pity for the rightful heir, son of the "wicked master," obtained a reconveyance of the earldom to him after his own decease. From that time the fortunes of the family began to decline. The 12th earl was imprisoned by his relatives as a spendthrift. The 16th earl, a companion in arms of the great Montrose, having no issue, through the influence of a powerful cadet of the family, lord Lindsay of the Byres, a new patent of the earldom was obtained from Charles I., bringing in his branch of the house before the descendants of the uncle of the 16th earl, who had been created lord Spynie, or the intermediate cadets of Edzell and Balcarres.

Lord Lindsay of the Byres, Viscount Garnock.—Sir William Lindsay, younger brother of the first earl of Crawford, acquired extensive estates with his wife, a daughter of sir William Mure of Abercorn. He was hereditary bailie and seneschal of the regality of the archbishopric of St. Andrews, an office which remained in his family till the middle of last century. His grandson was made lord Lindsay of the Byres, county Haddington, in 1445. The lords Lindsay of the Byres were sturdy champions of popular rights and of the Presbyterian faith; their principal residence was Struthers castle in Fife. The fourth lord endeavored in vain to dissuade James IV. from his fatal expedition to England in 1513; in consequence of which, James vowed that, on his return, he would hang him on his own gate, a threat, of course, rendered futile by the fatal result of Flodden. The fifth lord was one of the four noblemen to whom the charge of the infant queen Mary was committed on the death of her father. The sixth lord, the fiercest and most bigoted of the lords of the congregation, was deputed by the rest to obtain Mary's compulsory resignation at Lochleven, an office which he is said to have discharged in a severe and repulsive manner; and the seventh lord bearded James VI. in the presence-chamber regarding the changes he was effecting in ecclesiastical polity. The tenth lord Lindsay of the Byres was in 1644 created earl of Lindsay; and in virtue of Charles I.'s above-mentioned patent, he became 17th earl of Crawford, a dignity enjoyed by his descendants till their extinction. He held the offices of high treasurer of Scotland, and an extraordinary lord of session; and though a warm partisan of the covenant, he was a loyal and consistent adherent of the Stuarts. In 1648 he entered with zeal into the proposal to raise an army to effect the king's rescue; and in 1657, while forwarding Charles II.'s plan of marching into England, he was arrested, carried to London, and detained a prisoner in the Tower and Windsor castle. He was released by the "long" parliament in 1660, on the recall of the secluded members, and was reinstated in his offices and dignities at the restoration. We find him afterwards making a strong effort to dissuade Charles from introducing episcopacy in Scotland. The treasurer's grandson by a younger son was created viscount Garnock in 1703. The fourth viscount Garnock succeeded as 21st earl of Crawford; his son, the 22d earl, was the last of the direct line of the Byres; and at his decease in 1808, the Crawford earldom returned, in terms of the patent of Charles I., to the line of Balcarres, while the Crawford Lindsay estates went to heirs-female. A claim by an alleged descendant of this branch of the house to both peerage and estates, was long a matter of public interest and notoriety; it eventually collapsed from the discovery that the principal documents founded on were ingeniously contrived forgeries.

Sir David Lindsay of the Mount, lion king of arms, the courtly knight, poet, and philosopher, and friend of the reformation in its earlier stages, was descended from a natural son of the first sir William Lindsay of the Byres.

Earl of Balcarres and Crawford.—The Lindsays of Balcarres, in Fife, were a branch, and eventually the representatives of the Lindsays of Edzell, who, as already seen, had temporarily possessed the earldom of Crawford on the attainder of the "wicked master." The first of them was lord Menmuir, a lord of session and secretary of state to James VI., possessed of accomplishments and cultivation rare in his age. His son David was created lord Lindsay of Balcarres in 1633, and his grandson, Alexander, earl of Balcarres, in 1651, in reward of their steady support of the royal cause. The sixth earl of Balcarres became *de jure* earl of Crawford on the death of the 22d earl, the last of the Byres line; and that title has been recognized by the house of lords to belong to his son, James, seventh earl of Balcarres, and 23d earl of Crawford, father of the present representative of the family. The earl of Crawford further preferred without success a claim to the dukedom of Montrose, conferred by James III. Alexander William Crawford, since 1869 earl of Crawford and Balcarres, is author of *Sketches of the History of Christian Art* (1847); *Skepticism* (1861); *On the Theory of the English Hexameter; Œcumenicity in relation to the Church of England* (1870); and (1849) *Lives of the Lindsays*, a family memoir, combining to a rare extent genealogical research with biographical interest, to which reference is made for further particulars regarding the Lindsays.—See also Jervise, *Land of the Lindsays*.

LINDSAY, WILLIAM SCHAW; b. in Ayrshire, Scotland, in 1816; went to sea as cabin-boy at 15 years of age; was second mate in 1834, chief mate in 1835, and commander of a merchantman in 1836; became agent for the Castle-Eden coal company in 1841; took an active part in opening the port of Hartlepool and providing it with wharves and docks; in 1845 went to London, where in a short time he was recognized as one of the "merchant princes" of the city; was a candidate for parliament in 1852, and defeated; but in 1854 elected for Tynemouth and North Shields, and re-elected without opposition in 1857; two years later was elected for Sunderland. He distinguished himself in parliament by earnest, careful attention to commercial and shipping interests, and took part in organizing the administrative reform association. Besides numerous pamphlets on mercantile and political topics he has published *Our Navigation, Mercantile, and Marine Laws Considered; Our Merchant Shipping;* and *The History of Merchant Shipping,* the latter a work in 2 volumes.

LINDSAY, or LYNDSAY, Sir DAVID, OF THE MOUNT, one of the best and long the most popular of the older Scottish poets, was the son of David Lindsay of Garmylton, in East Lothian, whose grandfather was a son of sir William Lindsay of the Byres. The poet is said by Chalmers to have been born at the Mount about the year 1490, but Laing in his recent edition of Lyndsay (1871) notes the absence of evidence on this point, Chalmers having apparently assumed it as a consequence of his supposition that the poet's father was "David Lyndsay of the Mounthi," while Laing has shown that this was the poet's grandfather. The name "Da Lindesay" occurs in the list of "incorporated" students in St. Salvator's college, St. Andrews, for the year 1508 or 1509. It may be that of the poet. We cannot tell when he entered the royal service, but in Oct., 1511, he is found taking part in a play acted before the court of king James IV. In the following spring he was appointed "keeper" or "usher" of the prince, who, when little more than a twelvemonth old, became king James V.; and his verses preserve some pleasing traces of the care and affection with which he tended the king's infant years. His wife, Janet Douglas, had long the charge of the royal apparel. In 1524 the court fell under the power of the queen-mother and the Douglases, and Lindsay lost his place; but four years afterward, when the Douglases were overthrown, Lindsay was made lion king at arms, and at the same time received the honor of knighthood. In this capacity he accompanied embassies to the courts of England, France, Spain, and Denmark. He appears to have represented Cupar in the parliaments of 1542 and 1543; and he was present at St. Andrews in 1547, when the followers of the reformed faith called Knox to take upon himself the office of a public preacher. He died childless before the summer of 1555.

The first collection of Lindsay's poems appeared at Copenhagen about 1553. They were republished at Paris or Rouen in 1558; at London in 1566, 1575, and 1581; at Belfast in 1714; in Scotland in 1568, 1571, 1574, 1588, 1592, 1597, 1604, 1610, 1614, 1634, 1648, 1696, 1709, 1720, and 1776. This mere enumeration of editions might be enough to show the great popularity which Lindsay long enjoyed. For nearly two centuries, indeed, he was what Burns has since become—the poet of the Scottish people. His works were in almost every house, his verses on almost every tongue. Like Burns, he owed part of his popularity, no doubt, to his complete mastery of the popular speech. But, like Burns, Lindsay would have been read in whatever language he chose to write. His verses show few marks of the highest poetical power, but their merits otherwise are great. Their fancy is scarcely less genial than their humor, and they are full of good sense, varied learning, and knowledge of the world. They are valuable now, if for nothing else than their vivid pictures of manners and feelings. In the poet's own day, they served a nobler purpose, by preparing the way for the great revolution of the 16th century. It has been said that the verses of Lindsay did more for the reformation in Scotland than all the sermons of Knox. Like Burns, Lindsay shot some of his sharpest shafts at the clergy. The licentiousness that characterizes his verses must be attributed in part to the age in which he lived. The earliest and most poetical of his writings is *The Dreme;* the most ambitious, *The Monarchie;* the most remarkable in his own day, perhaps, was *The Satyre of the Thrie Estaitis;* but that which is now read with most pleasure, both for the charm of its subject and for its freedom from the allegorical fashion of the time, is *The Historie of Squyer Meldrum.* An admirable edition of Lindsay's works is that of Chalmers (Lond. 1806, 3 vols.); but in points of detail it is less accurate than that of Laing (Edin. 1871, 2 vols.).

LINDSLEY, PHILIP, D.D., 1786–1855; b. at Morristown, N. J.; graduated at Princeton in 1804, where he was tutor in 1807–9 and 1812, professor of languages in 1813, and vice-president in 1817, at which time he was ordained as a minister of the Presbyterian church. Between 1820 and 1839 he was offered the presidency of 10 different colleges, and in 1824 accepted that of the university of Nashville, Tenn., which he held till 1850, when he resigned, after a very successful career. He subsequently held the professorship of archæology and church polity in the Presbyterian theological seminary at New Albany, Ind. His complete works, comprising sermons and educational and other discourses and essays, together with a memoir by Leroy J. Halsey, were published in 1865. Died at Nashville.

LINE, an expression used in the army to distinguish ordinary cavalry and infantry from the guards, artillery, and engineers. It obviously takes its origin from the fact that the troops in question constituted the usual "line of battle."

LINE, in military or naval rank (*ante*). The line-officers of the navy and army in the United States are divided into eleven grades, and their comparative rank on the active or retired list is as follows:

The admiral of the navy ranks with a general of the army.				
The vice-admiral	"	"	lieutenant-general of the army.	
10 rear-admirals of the navy rank with			major-generals	"
25 commodores	"	"	brigadier-generals	"
50 captains	"	"	colonels	"
90 commanders	"	"	lieutenant-colonels	"
80 lieutenant-commanders	"	"	majors	"
280 lieutenants	"	"	captains	"
100 masters	"	"	first lieutenants	"
100 ensigns	"	"	second lieutenants.	"
— midshipmen				

All staff officers are appointed by the president with the sanction of the senate. He also appoints for vessels in actual service all warrant officers, such as boatswains, gunners, sail-makers, and carpenters, that may be required. All officers not entitled to hold warrants are called petty officers. All officers of the army above the grade of sergeant hold their authority by commissions, and are therefore termed commissioned officers, to distinguish them from non-commissioned officers.

LINE, MATHEMATICAL, denotes a magnitude having only one dimension. Euclid defines it to be "that which has length without breadth."

LINE, MATHEMATICAL (*ante*), may be straight, curved, or mixed; a straight line is defined by Euclid as "one which lies evenly between two points." To this, it is objected, the idea of straightness is presupposed in the definition; it is said, also, by some mathematicians that the order of definitions is reversed by Euclid from the order of comprehension; that the mind conceives first the solid and then successively the surface, line, and point. The definition now generally given is that a straight line is the *shortest* path between any two given points; a curved line is one not straight, i.e. between any two geometrical points in its extent a shorter line may be drawn; the term mixed line is used to denote a union of the two in extent, but is hardly a pure geometrical concept. Straight lines may be produced both ways without limit; may be drawn through any two points in space, and any two coincide throughout indefinite extension if two points in the one coincide with two points in the other. If we admit the idea of motion, we may define a line as the path of a moving point, a surface as the path of a moving line, and a solid as that of a moving surface. Thus if a straight line revolves about one extremity as an axis, it will describe with the other a circle of which it is itself the radius; and a semicircle revolving about its diameter will produce a spherical surface.

LINEAL DESCENT, the descent in a right line, as from father to son, grandson, etc.

LINEN AND LINEN MANUFACTURES, fabrics manufactured wholly from flax or lint (Lat. *linum*). The manufacture of linen has reached its greatest perfection in France and the Netherlands, where the stimulus to produce fine yarns (see SPINNING) for the lacemakers has given rise to such care and attention in the cultivation and preparation of flax that in point of fineness of fiber they have been unequaled. Consequently the linens of France, Belgium, and Holland have long enjoyed a well-deserved reputation, and in the article of lawn, which is the finest kind of linen cloth made, the French are unrivaled. In the ordinary kinds of linen our own manufactures are rapidly improving, and will soon equal in quality the productions of continental competitors. Those of Ireland, especially, are remarkable for their excellence, and this trade has become a very important one in that country; whilst in Scotland a large trade in the coarser and inferior kinds has located itself. The export of linen manufactures and linen yarns from the United Kingdom in 1876 was in value £7,070,149; and the amount produced for home-consumption may be reckoned at £10,000,000.

The chief kinds of linen manufactures, besides yarn and thread, which will be described under SPINNING, are: LAWN (Fr. *linon*), the finest of flax manufactures, formerly exclusively a French production, but very fine lawns are now made in Belfast, Armagh, and Warringstown; cambric (q.v.); damask (q.v.); diaper (q.v.). Of the finer plain fabrics, *sheetings* are the most important in this country. The chief places of their manufacture are Belfast, Armagh, and Leeds. Common *sheeting* and *toweling* are very extensively manufactured in Scotland, particularly at Dundee, Kirkcaldy, Forfar, and Arbroath. *Ducks*, *huckabacks*, *osnaburgs*, *crash*, and *tick* (corrupted from *ticken* and *dekken*, Dutch for cover) are very coarse and heavy materials, some fully bleached, others unbleached or nearly so. They are chiefly made in Scotland, the great seat of the manufacture being at the towns just mentioned, although much is made in the smaller towns and villages, also at Leeds and Barnsley in England. Some few varieties

of velvet and velveteen are also made of flax at Manchester, and much linen-yarn is used as warp for other materials.

Linen is one of the most ancient of all textile manufactures, at least it is one of the earliest mentioned. The cerecloth, in which the most ancient mummies are wrapped, proves its early and very extensive use among the Egyptians. It formed also parts of the garments of the Hebrew as well as the Egyptian priests. Panopolis was the Belfast of the ancients, as, according to Strabo, it was there the manufacture of linen was chiefly conducted. The wonderful durability of linen is evidenced by its existence on mummies, and by the remarkable fact mentioned by the German writer, Seetzen, and referred to by Blumenbach, that he had found several napkins within the folds of the covering on a mummy which he unwrapped, and that he had them washed several times without injury, and used with great veneration "this venerable linen, which had been woven more than 1700 years." From the time of these ancient Egyptians up to the present period, the use of linen for clothing and other purposes has been continuous; and although the introduction and vast development of the cotton manufacture checked its consumption for a time, it has fully regained, and has indeed exceeded, its former proportions as one of our great staples.

LINEN AND LINEN MANUFACTURES (*ante*). Linen was first manufactured in England by Flemish weavers under the protection of Henry III., in 1253; it was not until 80 years after, that a colony of Scots planted themselves in the n.e. part of Ireland, and established there the linen manufacture. In 1696 hemp, flax, linen-thread, and yarn were permitted to be exported from Ireland duty free: it was not before 1860 that the duty was taken off imported linen.—The introduction of the linen manufacture into the United States took place in 1834, when a mill was set up at Fall River, Mass. As late as 1870 there were but 10 establishments for this manufacture in the United States, their product being set down at $2,178,775. The importation into the United States in the year ending June 30, 1879, of flax and manufactures of flax, jute and its manufactures, and hemp, amounted to $23,157,769.

LING, *Lota molva*, a fish of the family *gadidæ*, abundant on most parts of the British coasts, and elsewhere throughout the northern seas, and in value almost rivaling the cod. In form it is much more elongated than the cod, and even more than the hake, with which it agrees in having two dorsal fins and one anal fin, the anal and second dorsal long; but the genus differs in the presence of barbels, of which the ling has only one at the extremity of the lower jaw. The ling is generally 3 or 4 ft. long, sometimes more, and has been known to weigh 70 pounds. The color is gray, inclining to olive; the belly, silvery; the fins edged with white. The tail-fin is rounded. The gape is large, and the mouth well furnished with teeth. The ling is a very voracious fish, feeding chiefly on smaller fishes. It is also very prolific, and deposits its spawn in June, in soft oozy ground near the mouths of rivers. It is found chiefly where the bottom of the sea is rocky. Great numbers are caught in the same manner as cod, by hand-lines and long lines, on the coasts of Cornwall, the Hebrides, the Orkney and Shetland islands, etc.; and are split from head to tail, cleaned, salted in brine, washed, dried in the sun, and sent to the market in the form of *stock-fish*. They are largely exported to Spain and other countries. The air-bladders or *sounds* are pickled like those of cod. The liver also yields an oil similar to cod-liver oil, which is used for the supply of lamps in Shetland and elsewhere.—Other species of ling are found in the southern seas.—The burbot (q.v.) is a fresh-water species of the same genus.

LING. See HEATH (*ante*).

LING, PETER HENRIK, 1776–1839; b. in Sweden; of an adventurous spirit, he traveled as a young man through Germany and France; was fencing-master at the university of Lund in 1805, in 1813 teacher of fencing at the military school of Carlesberg, and in 1816 director of the gymnastic institute of Stockholm, where he died. He bestowed much thought and labor upon his profession, developing gymnastic exercises as a form of medical treatment, leading finally to what is now extensively known as the "Swedish movement cure." His poetical works, which appeared from time to time, were addressed to the patriotism of the Swedes, and well calculated to inspire in them a deep love of country and a heroic determination to defend it at all hazards.

LINGA (a Sanskrit word which literally means a sign or symbol) denotes, in the sectarian worship of the Hindus, the *phallus*, as emblem of the male or generative power of nature. The Linga-worship prevails with the Sai'vas, or adorers of Si'va (see Hindu Religion under INDIA). Originally of an ideal and mystical nature, it has degenerated into practices of the grossest description; thus taking the same course as the similar worship of the Chaldeans, Greeks, and other nations of the east and west. The manner in which the Linga is represented is generally inoffensive—the pistil of a flower, a pillar of stone, or other erect and cylindrical objects, being held as appropriate symbols of the generative power of Si'va. Its counterpart is *Yoni*, or the symbol of female nature as fructified and productive. The Si'va-Purâna names 12 Lingas which seem to have been the chief objects of this worship in India.

LINGAN, JAMES MACCUBIN, 1752–1812; b. in Maryland, and took an active part in the war of the revolution, rising to the rank of brig-gen.; was one of the prisoners at

fort Washington, and kept for a long time in the prison-ship; after the war, was collector of the port of Georgetown, Md.; resided in Baltimore in 1812, where he was killed, July 28, by a mob while bravely defending the printing-office of the *Federal Republican*.

LINGARD, JOHN, D.D., a member of a humble Roman Catholic family, was b. at Winchester, Feb. 1, 1771; and being destined for the priesthood of that church, was sent to the English college of Douai, in France, where he remained till that college, in common with most of the religious establishments of France, was broken up by the troubles of the revolution. The act called the Catholic relief act enabling Catholics to open schools in England, the Douai community was transferred to Crookhall, and ultimately to Ushaw, in the county of Durham. Lingard continued attached to the college in its several migrations, although not always resident. In 1793 he accepted the office of tutor in the family of lord Stourton; but in the following year he returned to complete his theological studies at Crookhall, where he entered into priest's orders, and in which he continued as professor of philosophy, prefect of studies, and vice-president, until 1810, when he was named president. In 1811, however, he accepted the humble cure of Hornby, near Lancaster, in which he continued to reside till his death, July 13, 1851. Lingard's first important work was the *Antiquity of the Anglo-Saxon Church* (8vo, 1806), reprinted in 1810, and afterwards, in a much enlarged edition (2 vols. 1845). This was but the pioneer of what became eventually the labor of his life—a *History of England* (6 vols. 4to), published at intervals, 1819–25; and afterwards in 14 vols. 8vo, 1823–31. This work, before the death of the author, had passed through six editions, the last of which (10 vols. 8vo) appeared in 1854–55. From its first appearance, it attracted much attention, as being founded on original authorities and the result of much new research. It was criticised with considerable asperity in its polemical bearings; but the author, in his replies, displayed so much erudition, and so careful a consideration of the original authorities, that the result was to add materially to his reputation as a scholar and a critic. It won for itself a place as a work of original research, and although it bears unmistakable evidence of the religious opinions of the author, yet there is also evidence of a sincere desire to investigate and to ascertain the truth of history. In recognition of his great services, many honors were offered to him; and he received a pension of £300 from the crown in reward of his literary services. His remains were interred in his old college of St. Cuthbert, at Ushaw.

LINGAYEN', a t. of the island of Luzon, Philippine islands (q.v.), on a bay of the same name. Pop. 23,063, who export rice and sugar.

LINGUA FRANCA, a kind of corrupt Italian, with a considerable admixture of French words and idioms; spoken along the shores of the Mediterranean.

LINGUAGROS'SA, a t. of Sicily, in the province of Catania, on the north-eastern slope of Mt. Etna, 1725 ft. above the sea, 37 m. s.w. from Messina. The name is also frequently spelt Linguaglossa. The pop. of the town at the census of 1871 was close on 8,500.

LINGUISTICS. See PHILOLOGY, *ante*.

LING'ULA, a genus of brachiopodous mollusks, exhibiting the remarkable peculiarity of a long fleshy pedicel supporting a bivalve shell, and passing between the beaks of the valves. They live attached to rocks in the seas of warm climates, particularly of the Indian archipelago and Polynesia. The genus is interesting, because, although few recent species are known, fossil species are numerous, and are found in the fossiliferous beds of Britain and other countries, the seas of which now produce none of their congeners.

LINIMENTS (from the Latin word *linīre*, to besmear) may be regarded, in so far as their physical properties are concerned, as ointments having the consistence of oil, while, chemically, most of them are *soaps*—that is to say, compounds of oils and alkalies. In consequence of their slighter consistence, they are rubbed into the skin more readily than ointments. Among the most important of them are: *Liniment of ammonia*, popularly known as *hartshorn and oil*, which is prepared by mixing and shaking together solution of ammonia and olive-oil, and is employed as an external stimulant and rubefacient to relieve neuralgic and rheumatic pains, sore throat, etc.: *Soap liniment*, or *opodeldoc*, the constituents of which are soap, camphor, and spirits of rosemary, and which is used in sprains, bruises, rheumatism, etc.: *Liniment of lime*, or *carron oil*, which is prepared by mixing and shaking together equal measures of olive or linseed oil and lime-water; it is an excellent application to burns and scalds, and from its general employment for this purpose at the Carron iron-works, has derived its popular name: *Camphor liniment*, consisting of camphor dissolved in olive-oil, which is used in sprains, bruises, and glandular enlargements, and which must not be confounded with *compound camphor liniment*, which contains a considerable quantity of ammonia, and is a powerful stimulant and rubefacient: *Opium liniment*, which consists of soap liniment and tincture of opium, and is much employed as an anodyne in neuralgia, rheumatism, etc.; and the *simple liniment* of the Edinburgh Pharmacopœia, which is composed of four parts of olive-oil, and one part of white wax, and is used to soften the skin and promote the healing of chaps.

LINK, a unit of measure in land surveying, $7\frac{92}{100}$ in. in length.

LINKÖPING (old Norse *Longaköpungar*, later *Liongakiöping*), one of the oldest towns in Sweden, capital of the læn of the same name, is situated on the Stänga, which here flows into lake Roxen, 110 m. s.w. of Stockholm. It is regularly built, with fine market-places and public squares, but the houses are mostly of wood. Linköping has three churches, of which the cathedral—a Gothic edifice of the 12th c., containing monuments of many illustrious personages—is one of the most beautiful in Sweden. It also possesses a library of 30,000 vols. Its trade is considerable. Pop. '76, 8,373. In old heathen times, Linköping was a place of sacrifice.

LINLEY, THOMAS, 1725–95; b. Wells, Eng.; was the pupil first of Chilcot, organist of the Abbey at Bath, and finished his studies under Paradies, an eminent Venetian; established himself in Bath, teaching music, and giving concerts, his two daughters Mrs. Sheridan and Mrs. Tickell contributing greatly to the attraction by their superior singing; removed to London, to conduct the oratorios, first in connection with Stanley, then with Dr. Arnold. Christopher Smith having retired from the management of the London oratorios, Mr. Linley succeeded him in connection with Mr. Stanley, the blind composer, and on his death with Dr. Arnold. In 1775 he set the music to Sheridan's opera *The Duenna*, which had unparalleled success, having been performed 75 times that season. He united in 1776 with Sheridan in purchasing an interest in the Drury Lane theater, Linley having direction of the musical department, which he conducted for 12 years. Among other pieces he produced *Carnival of Venice; Selima and Azor* from the French. His *Six Elegies*, written early in life, were original, simple, and beautiful, and did much for his fame and fortune. His twelve ballads and a madrigal have great merit. The death of his son Thomas by drowning at the age of twenty-two affected him so deeply that he never recovered from the shock. The son had made great proficiency in music with the best masters of Italy and Germany, and lived in the closest intimacy with Mozart.

LINLEY, WILLIAM, 1767–1835; son of Thomas; educated at Harrow and St. Paul's schools. For several years he was in the service of the East India company at Madras and Calcutta. He returned from India early with a competence, and devoted the remainder of his life to literature and music. Of music he was passionately fond, and produced a number of glees which evinced much originality and taste. He published also a set of songs, two sets of canzonets, and many detached pieces, and compiled *Dramatic Songs of Shakespeare*, 2 folio volumes, a work of much research, in which are several of his own elegant compositions. He wrote also two novels, and two comic operas which were performed at Drury Lane. He wrote besides an elegy on the death of his sister Mrs. Sheridan.

LINLITHGOW, or WEST LOTHIAN, a co. in Scotland, is bounded on the n. by the firth of Forth, having the counties of Mid-Lothian, Lanark, and Stirling on the e., s., and west. Its length, n. to s., is 20 m., and e. to w. 15 miles. Its area is 127 sq.m., or 81,114 acres. The surface of the ground is irregular, but the hills are inconsiderable with the exception of one eminence 1500 ft. high. The climate is changeable, but healthy. The soil is very varied, and, except along the borders of the firth, there is little land of first quality. In some of the high grounds there is good pasture, also a considerable breadth of unreclaimed moss. Excellent farming prevails here as in Edinburghshire and Haddingtonshire. There are few streams of any note, the Almond and Avon being the principal. The minerals are of considerable value. The freestone used in building the royal institution, national gallery, and other public buildings in Edinburgh, was got at Binny. There are several collieries in full and profitable operation.

There are two royal burghs—Linlithgow, the county town, and Queensferry. The other principal towns are Bathgate and Borrowstounness. This county is intersected with railways, and the Edinburgh and Glasgow Union canal traverses it for upwards of 10 miles. In 1674 the valued rent was £5,073. In 1811 the real rent was £88,745; and in 1878–79 it was, excluding railways and canals, £197,623.

The following are the agricultural statistics for 1876: acres under a rotation of crops and grass, 58,378, of which there were 1362 acres of wheat, 5,146 acres of barley, 10,761 acres of oats, 916 acres of beans, 2,210 acres of potatoes, and 4,683 acres of turnips. Of live-stock, the numbers were—horses employed in agriculture, 2,140; cattle, 10,902; sheep, 19,906; swine, 1858. Salt is made in the county; and in the towns are tanneries, breweries, distilleries, and chemical works. This county contains several remains of Roman antiquities. Pop. '71, 40,965. Constituency in 1876–77, returning one member to parliament, 1193.

LINLITHGOW, a market-town, and royal and parliamentary burgh of Scotland, chief t. of the co. of the same name, is situated on a small lake, 16 m. w. of Edinburgh. It is one of the oldest towns in Scotland, and, though it has been much modernized, still contains many antiquated houses, and some ruins rich in historical association. The parish church of St. Michael's (built partly in the 15th and partly in the 16th c.), a portion of which is still in use, is a beautiful specimen of the latest Scottish Gothic. The palace, strikingly situated on an eminence which juts into the lake (of 102 acres), dividing it into two almost equal parts, is heavy, but imposing in appearance; was frequently the

residence of the Scottish monarchs, and was the birthplace of Mary Queen of Scots, and of her father, James V. The earliest record of its existence is of the time of David I. (1124–53), and fragments of various ages are easily detected. The latest work is of the time of James VI. Linlithgow unites with several other burghs in sending a member to parliament. Pop. '71, 3,690.

LINN, a co. of e. Iowa, intersected by the Cedar and Wapsipinicon rivers, and drained in part by Buffalo and Prairie creeks; traversed by the Chicago and North-western, the Dubuque and South-western, and the Burlington, Cedar Rapids and Minnesota railroads; 720 sq.m.; pop. '80, 37,235. The surface is undulating, and diversified with prairies and forests, the latter filled with hard timber. The soil is fertile and well watered, and rests partly upon a limestone foundation. Wheat, corn, oats, hay, butter, cattle, and pork are staple products. The city of Cedar Rapids is in the county. Valuation of real and personal property, $15,412,248. Capital, Marion.

LINN, a co. in e. Kansas, bordering upon Missouri; intersected by the Osage river, and drained in part by Big Sugar and North Sugar creeks; traversed by the Mississippi River, Fort Scott and Gulf railroad; 630 sq.m.; pop. '80, 15,299. About 90 per cent of the surface is prairie, while forests grow along the streams. The soil is fertile, producing excellent crops of wheat, corn, oats, and hay. Large numbers of cattle are raised, and butter is a staple production. Limestone and bituminous coal abound. Valuation of real and personal property, $5,002,650. Capital, Mound City.

LINN, a co. in n. Missouri, intersected by Locust and Yellow creeks, and drained by Muscle river, and several affluents of Grand river, which touches the s.w. corner of the county; traversed by the Hannibal and St. Joseph railroad; 648 sq.m.; pop. '80, 20,016, of whom 14,499 were of American birth. The surface is undulating, and much of it is covered with forests. The soil is fertile, and the chief staples are corn, oats, wheat, cattle, and pork. Valuation of real and personal property, $6,500,000. Capital, Linneus.

LINN, a co. in w. Oregon, bounded n. by the n. fork of the Santiam river, and w. by the Willamette; drained by the Calapooya river and the s. fork of the Santiam; intersected by the Oregon and California railroad; 2,350 sq.m.; pop. '80, 12,675, of whom 8,474 were of American birth. The surface is diversified with mountains, prairies, and extensive forests. Mount Jefferson, a high peak of the Cascade range, covered with perpetual snow, stands on the e. border of the county. The soil of the valleys and prairies is very productive. The chief productions are wheat, oats, butter, hay, lumber, and wool. The quantity of wheat raised in 1875 was 998,626 bushels. Valuation of real and personal property, 5,500,000. Capital, Albany.

LINN, JOHN BLAIR, D.D., 1777–1804; b. in Shippensburg, Penn., but removed in childhood to New York; graduated at Columbia college in 1795, when but 17 years old, and was afterwards a student in the law office of Alexander Hamilton. A "serious drama," written by him and entitled *Bourville Castle, or the Gallic Orphan*, was brought out at the John street theater, in 1797, but was not successful. Not long after this he abandoned the law and studied theology under the rev. Dr. Romeyn at Schenectady. In June, 1799, he became assistant pastor of rev. Dr. Ewing's church in Philadelphia. In 1800 he wrote a poem on the *Death of Washington*, and in 1802 published *The Powers of Genius*, a poem of about 600 lines, which was well received, soon reaching a second edition, and being reprinted in England. In 1803 he entered into controversy with Dr. Priestley, occasioned by the latter's comparison of Socrates with Jesus. He conducted his side of the debate so well that the university of Pennsylvania conferred upon him the title of D.D. Died in Philadelphia of consumption.

LINN, WILLIAM, D.D., 1752–1808; b. near Shippensburg, Penn.; graduated at Princeton in 1772; studied theology with the rev. Dr. Cooper of Middle Spring, Penn., and licensed to preach in 1775. He served for a time as a chaplain in the revolutionary war, afterwards taught an academy at Somerset, Md., became pastor of a church in Elizabethtown, N. J., in 1786, and a few months later, one of the pastors of the collegiate Dutch reformed church in New York, where he remained until 1805, when the state of his health compelled him to retire. He was distinguished as an eloquent and successful preacher. He published *Discourses on Scripture History; The Signs of the Times*, a series of essays in favor of the French revolution; a *Funeral Eulogy of Gen. Washington*, and many separate sermons. Died at Albany.

LINNÆ'A, a genus of plants belonging to the order caprifoliaceæ or honeysuckle family. It contains only one species, *L. borealis*. It was found by Linnæus in Lapland in 1732 and named after him by Gronovius. Calyx 5-pointed, oval-shaped, deciduous. Corolla narrow, bell-shaped, five-lobed. Stamens four, two shorter, inserted towards the base of the corolla. Pod, three-celled, but having only one seed, the other two cells having abortive ovules. It is a slender creeping and trailing little evergreen, somewhat hairy, rounded oval leaves contracted at the base into short petioles, and thread-like upright peduncles having two pedicels at the top, each bearing a delicate and fragrant nodding flower. Corolla purple and whitish, hairy inside. It inhabits the more northern parts of Europe, Asia, and America—found in moist, mossy woods and cold bogs;

British America and northern United States; and grows somewhat rarely in New Jersey and in the mountainous parts of Maryland.

LINNÆ'US. See LINNÉ, *ante*.

LINNÉ, KARL VON, often called LINNÆUS, one of the greatest of naturalists, was b. May 4, 1707, at Rashult, in Smaland (Sweden), where his father was a country parson in very poor circumstances. His parents intended him for his father's profession, but he made little proficiency in the necessary classical studies, manifesting, however, from his very boyhood, the greatest love for botany. His father, disappointed, proposed to apprentice him to a shoemaker; but Dr. John Rothmann, a physician at Wexiö, a friend of his father, undertook for a year the expense of his education, and guided him in the study of botany and of physiology. In 1727 the young naturalist went to study medicine at Lund, and in the year following he went to Upsala, but during his attendance at the university he endured great poverty. Olaf Celsius received him at last into his house, and availed himself of his assistance in preparing a work on the plants of the Bible. He also won the favorable regard of Olaf Rudbeck, the professor of botany at Upsala, by a paper in which he exhibited the first outlines of the sexual system of botany, with which his name must ever remain connected. Rudbeck appointed him curator of the botanic garden and botanical demonstrator. In his 24th year he wrote a *Hortus Uplandicus*. From May to November, 1732, he traveled in Lapland, at the expense of the government. The fruits of this tour appeared in his *Flora Lapponica* (Amst. 1737). He afterwards spent some time at Fahlun, studying mineralogy, and there he became acquainted with the lady whom he afterwards married, the daughter of a physician named Moräus, who supplied him with the means of going to Holland to take his degree, which he obtained at Harderwyck in 1735. In Holland he became the associate of some of the most eminent scientific men of the time, and won for himself a high reputation as a naturalist, developing original views which attracted no little attention, while he eagerly prosecuted his researches in all departments of natural history. During his residence in Holland Linné composed and published, in rapid succession, some of his greatest works, particularly his *Systema Naturæ* (Leyd. 1735), his *Fundamenta Botanica* (Leyd. 1736), his *Genera Plantarum* (Leyd. 1737), his *Corollarium Generum Plantarum* (Leyd. 1737), etc. He visited England and France, and returned to Sweden, where, after some time, he was appointed royal botanist and president of the Stockholm academy. In 1741 he was appointed professor of medicine in Upsala, and in 1742 professor of botany there. The remainder of his life was mostly spent at Upsala in the greatest activity of scientific study and authorship. He produced revised editions of his earlier works, and numerous new works, a *Flora Suecica* (1745), *Fauna Suecica* (1746), *Hortus Upsaliensis* (1748), *Materia Medica* (1749–52), his famous *Philosophia Botanica* (1751), and the *Species Plantarum* (1753), in some respects the greatest of all his works. He died Jan. 10, 1778, the last four years of his life having been spent in great mental and bodily infirmity. Linné was not only a naturalist of most accurate observation, but of most philosophical mind, and upon this depended in a great degree the almost unparalleled influence which he exercised upon the progress of every branch of natural history. Among the important services which he rendered to science, not the least was the introduction of a more clear and precise nomenclature. The groups which he indicated and named have, in the great majority of instances, been retained amid all the progress of science, and are too natural ever to be broken up; while, if the botanical system which he introduced is artificial, Linné himself was perfectly aware of this, and recommended it for mere temporary use till the knowledge of plants should be so far advanced that it could give place to a natural arrangement. See BOTANY.

LINNELL, JOHN, b. London, 1792. In 1805 he was pupil of John Varley, father of the present school of water-color painting. In 1807 he exhibited at the academy "Fishermen, a Scene from Nature." The same year he received a medal at the Royal academy for a drawing from the life, and in 1809 at the British institution, the prize of 50 guineas for the best landscape. He painted many views in Wales and elsewhere, and in 1821 exhibited landscape and portraits. His paintings in earlier years were portraits, but subsequently he devoted himself to landscape and figure painting. His chief works are: "The Morning Walk," "The Windmill," "A Wood Scene," "Eve of the Deluge," "The Return of Ulysses," "Christ and the Woman of Samaria," "The Disobedient Prophet," "The Timber Wagon," "Barley Harvest," "Under the Hawthorn," "Crossing the Brook," "The Last Gleam before the Storm," "Harvest Showers," "A View in Windsor Forest." Among his numerous portraits are "A Family Group—the Artist's Children," those of several fellow-artists, sir Robert Peel, and Thomas Carlyle. Linnell's portraits are in a unique style, deeply studied in character, simple and real, and he ranks among the best landscape-painters.

LINNET, *Linota*, a genus of small birds of the family *fringillidæ*, nearly resembling the true finches, goldfinches, etc. The bill is short, straight, conical, and pointed; the wings long and somewhat pointed; the tail forked. The species are widely distributed in the northern, temperate, and arctic regions, but much confusion has arisen concerning them, from the difference between the plumage of the breeding season and that of the greater part of the year. The COMMON LINNET (*L. cannabina*), or GREATER RED-

POLE (qu. *redpoll*), is common in almost every part of the British islands and of Europe, and extends over Asia to Japan. In size it is about equal to the chaffinch. In its winter plumage its prevailing color is brown, the quill and tail feathers black with white edges; in the nuptial plumage the crown of the head and the breast are bright vermilion color, and a general brightening of color takes place over the rest of the plumage. This change of plumage causes it to be designated the brown, gray, or rose linnet, according to the season of the year and the sex. It is the *lintie* of the Scotch. The sweetness of its song makes it everywhere a favorite. It sings well in a cage, and readily breeds in confinement; but the brightness of the nuptial plumage never appears. The linnet abounds chiefly in somewhat open districts, and seems to prefer uncultivated and furze-covered grounds. Its nest is very often in a furze-bush or hawthorn-hedge; is formed of small twigs and stems of grass, nicely lined with wool or hair; the eggs are four or five in number, pale bluish white, speckled with purple and brown. Linnets congregate in large flocks in winter, and in great part desert the uplands, and resort to the sea-coast.—The MEALY REDPOLE (*L. canescens*) is also a widely distributed species, and is found in North America, as well as in Europe and Asia, chiefly in very northern regions. It is rare in Britain. In size it is nearly equal to the common linnet. By some it is regarded as a larger variety of the LESSER REDPOLE or COMMON REDPOLE (*L. linaria*), which is common in Britain, although in the south of England it is chiefly known as a winter visitant. The forehead, throat, and lore are black; in the spring plumage, the crown of the head is deep crimson; the general color is brown of various shades. The species is common in all the northern parts of the world, enlivening with its pleasant twitter and sprightly habits even the desolate wastes of Spitzbergen.—The only other British species is the MOUNTAIN LINNET, or TWITE (*L. montium*), chiefly found in mountainous or very northern districts. It is smaller than the preceding, has a yellowish bill, and never assumes the red color which marks the nuptial plumage of other species.

LINO'LEUM is, as its name is intended to denote, a peculiar preparation of linseed oil. In 1849 Niclés and Rochelder independently discovered that chloride of sulphur will solidify oil, and render it usable in many new ways. In 1859 M. Perra communicated to the académie des sciences the details of a mode of effecting this by mixing and melting the ingredients, and pouring the mixture out in a thin layer. By varying the proportions the resulting substance assumes varying degrees of consistency. Thus, 100 linseed oil + 25 chloride of sulphur produces a hard and tough substance; 100 oil + 15 chloride, a supple substance like india-rubber; and 100 oil + 5 chloride, a thick pasty mass. This third kind dissolves well in oil of turpentine. Mr. Walton afterwards found that, by the application of heat, linseed oil will become hard without the addition of chloride of sulphur. He conceives that it is not a mere drying, but a real oxidizing. Linseed oil, first boiled, is applied as a layer to a surface of wood or glass, then dried; then another layer; and so on till the required thickness is produced. The sheet is then removed, and is found to be very much like india-rubber in elasticity; in fact, the production of a layer by this means is analogous to the smearing of clay-molds with caoutchouc juice to produce india-rubber, as practiced in South America. See CAOUTCHOUC. The drying is a little expedited by adding a small portion of oxide of lead. The solid oil is crushed, and worked thoroughly between heated rollers; and when treated either with shellac or with naphtha, it becomes applicable in various manufacturing forms. The term *linoleum* properly applies to the hardened or oxidized oil itself, but it is chiefly used as a designation for one of the substances made from or with it, a kind of floor-cloth. When the oxidized oil is rolled into sheets it becomes a substitute for india-rubber or gutta-percha. When dissolved as a varnish or mastic and applied to cloth it is useful for water-proof textiles, felt carpets, carriage-aprons, wagon and cart sheets, nursing-aprons, water-beds, tank-linings, table-covers, etc., according to the mode of treatment. When used as a paint, it is useful for iron, for wood, and for ships' bottoms. When used as a cement it possesses some of the useful properties of marine glue. When vulcanized or rendered quite hard by heat it may be filed, planed, turned, carved, and polished like wood, and used for knife and fork handles, moldings, etc. When brought by certain treatment to the consistency of dough or putty, it may be pressed into embossed molds for ornamental articles. When used as a grinding-wheel, touched with emery, it becomes a good cutter. Lastly, when mixed with ground cork, pressed on canvas by rollers, the canvas coated at the back with a layer of the same oil in the state of paint, and the upper or principal surface painted and printed, it becomes the *linoleum* floor-cloth, for the production of which a factory has been established at Staines. Dunn's patented fabric for similar purposes has no oil in it: it is a mixture of cork-shavings, cotton or wool fibers, and caoutchouc spread upon a cotton or canvas back, and embossed with patterns; it is a kind of kamptulicon (q.v.).

LINSEED, the seed of flax, largely imported from the continent and India, for making *linseed oil* and *oil-cake;* in order to which the seeds are first bruised or crushed, then ground, and afterwards subjected to pressure in a hydraulic or screw press, sometimes without heat, and sometimes with the aid of a steam heat of about 200° Fahr. *Linseed oil* is usually amber-colored, but when perfectly pure it is colorless. It has a peculiar and rather disagreeable odor and taste. It is chiefly used for making varnishes, paints,

etc. That made without heat (*cold-drawn linseed oil*) is purer, and less apt to become rancid, than that in making which heat is applied. By cold expression, the seed yields from 18 to 20 per cent, and with heat from 22 to 27 per cent of oil. Linseed oil, boiled either alone or with litharge, white lead, or white vitriol, dries much more rapidly on exposure to the air than the unboiled oil; and *boiled* or *drying oil* is particularly adapted for many uses.—The oil-cake made in expressing linseed oil is very useful for feeding cattle, and, besides what is made in Britain, it is largely imported from the continent. See OIL-CAKE. Linseed itself is excellent food for cattle and for poultry. The seed coats abound in mucilage, which forms a thick jelly with hot water, and is very useful for fattening cattle.—*Linseed meal*, much used for poultices, is generally made by grinding fresh oil-cake, but it is better if made by grinding the seed itself.

LINSLEY, JOEL HARVEY, D.D., 1790–1868; b. in Cornwall, Vt.; graduated at Middlebury college in 1811, and was tutor there three years; studied law, and practiced in Middlebury until 1822, when he was ordained as a Congregational minister; spent some time in South Carolina as a missionary; was pastor of the South Congregational church in Hartford, Conn., from 1824 to 1832, and of Park street church, Boston, from 1832 to 1835, when he was elected president of Marietta (O.) college, a post which he held for 10 years. In 1847 he became pastor of the Second Congregational church in Greenwich, Conn., and remained there until his death.

LIN'STOCK, an iron-shod wooden staff used in gunnery, for holding the lighted match in readiness to be applied to the touch-hole of the cannon. In old pictures, the linstock is seen planted in the ground to the right rear of each piece, with a match smoking in each of the ends of the fork in which it terminates.

LINT. See FLAX.

LINTEL, the horizontal bearer over doors, windows, and other openings in walls, usually either of stone or wood.

LINTON, ELIZA LYNN, wife of W. J. Linton, b. at Keswick, Cumberland, Eng., 1822. She is the author of a series of papers, *The Girl of the Period*, which attracted wide attention several years ago while they were passing through the *Saturday Review*. She has published several novels, among them *Azeth, the Egyptian; Amymone, a Romance of the Days of Pericles; Realities*, a romance of modern life; *Lizzie Lorton of Greyrigg; Sowing the Wind; The True History of Joshua Davidson; Christian and Communist; Patricia Kemball.*

LINTON, WILLIAM JAMES, b. London, 1812; apprenticed to Mr. G. W. Bonner in 1828; was partner in 1842 of Mr. Orrin Smith, the distinguished wood-engraver, and with him was engaged in the first works published in the *Illustrated London News*. In his younger days he was a zealous chartist, intimate with the Italian, French, and Polish refugees, in whose meetings he took an active part; was deputed by the British workmen to carry to the French provisional government their first congratulatory address; was in 1851 one of the founders of the newspaper, the *Leader;* became in 1855 the editor and manager of *Pen and Pencil;* and for several years was a regular contributor to the *Nation*. He contributed papers to the *Westminster Review, Examiner*, and *Spectator*. As an engraver on wood he holds the first rank. He prepared and illustrated *The History of Wood Engraving; The Works of Deceased British Artists;* several volumes of *The English Republic*. He published also *Claribel and other Poems; Life of Thomas Paine*. In 1867 he came to the United States, resided several years in New York, executed many superior works, and removed to New Haven, where he has a large engraving establishment.

LIN-TSEH-SU, Chinese imperial commissioner, was b. in 1785 at Hing-hwa, in the province of Fuh-keen, and his Chinese biographers have not failed to find that his birth was attended with supernatural indications of future eminence. Till he reached his 17th year, he assisted his father in his trade of making artificial flowers, and spent his evenings in studying to qualify himself for the village competitive examinations, at which he succeeded in obtaining successively the degrees analogous to bachelor of arts and master of arts. His ambitious mind, not satisfied with these triumphs, pointed to Pekin as the fitting sphere of his talents, but poverty barred the way. Happily, however, a wealthy friend, who was filled with admiration for Lin-tseh-su's merits and virtues, invited him to become his son-in-law, and he was now in a position to push his fortune at the capital. He became a doctor of laws and a member of the Hanlin college, which latter honor qualified him for the highest official posts. When 30 years of age, he received his first official appointment as censor; and by displaying the same zeal and industry, combined with irreproachable probity, which he had shown in private life, he gradually rose into the favor of the emperor and his ministers. He was sent to superintend the repairing of the banks of the Yellow river; and on the termination of his mission, two years after, was highly complimented by his sovereign for his diligence and energy, and, as an evidence of imperial favor, was appointed to the post of financial commissioner for Kiang-nan, in which province a famine was at that time decimating the population. Lin-tseh-su exhausted all his private resources and emoluments in providing food for the sufferers, and by careful management succeeded in restoring the prosperity of the province. He was next appointed viceroy of the two provinces of

Shen-se and Kan-su, where, as in Kiang-nan he soon gained the affections of the people and the commendations of the emperor. On his reception by the emperor after his return, new titles were showered upon him, and he obtained the signal honor of entering the imperial precincts on horseback. But now his brilliant progress was to be checked. He had long urged upon his sovereign the adoption of stringent measures towards the importers, dealers, and consumers of opium, the bane and scourge of his native land; and on the commencement of difficulties with Great Britain, he was appointed to deal with the growing evil, and, if possible, put a stop to the obnoxious traffic. He arrived at Canton, invested with unlimited authority; but his unwise though well-meant measures excited a war with Britain, and brought down upon himself the vengeance of his incensed sovereign. He was banished to the region of Ele, where he employed himself in improving the agriculture of the country, by introducing more scientific methods of cultivation. He was soon recalled, and restored to more than his former honors, and did good service by crushing a rebellion in Yun-nan. His health now began to fail, and he obtained permission to retire to his native province; but shortly afterwards, while on his way to attack the Tai-pings, he died, Jan., 1850. His death was the signal for general mourning throughout China, and the emperor ordered a sacrificial prayer to be composed, recording the illustrious deeds of the departed; a signal favor, only conferred upon persons of extraordinary merit and virtue.

Lin-tseh-su, besides thoroughly mastering the statistics and politics of China, devoted much of his time to studying the geography and history of foreign countries, and to private literary study. He is ranked as one of the chief among Chinese poets; and the style, literary merit, and logical order of his public documents form a strange contrast to the usual diffuse, rambling, and incoherent style of Chinese state-papers.

LIN-TSING, a large and populous t. of China in the province of Shantung at the junction of the imperial canal and the Eu-ho river, 200 m. s. of Pekin. It has an octagonal pagoda of nine stories, built of porphyry, granite, and varnished bricks; and several temples, in one of which is a colossal idol of gold. The town has a large trade by the canal.

LINTZ, the capital of the crown-land of upper Austria, is situated in a pleasant district on the right bank of the Danube, which is here crossed by a wooden bridge 838 ft. long, 100 m. w. of Vienna. Pop. '69, 30,538. It is a strongly fortified, quiet town, and a bishop's seat, with numerous churches, benevolent institutions, and government offices. There are large imperial factories for carpets and other woolen goods; and cloths, cottons, cassimeres, fustians, leather, and cards are also made. The navigation of the Danube occasions a lively trade. Steamboats ply daily up the river to Ratisbon, and down the river to Vienna. The women of Lintz are celebrated for their beauty.

LINUM, the genus of plants of which common flax is the most important variety, the others being cultivated not for their fiber, but for ornament. Among these is the perennial flax of the western states, which grows to a height of 18 in., with tufts of slender stems with delicate blue flowers. Other varieties are found in Algiers and Texas.

LI'NUS, a Christian at Rome, known as one of those who sent salutations by Paul to Timothy. Irenæus, in the latter half of the 2d c., says that "Peter and Paul, when they founded and built up the church at Rome, committed the office of its episcopate to Linus." Eusebius in the first half of the 4th c., followed by Theodoret in the 5th, Baronius in the 16th, and Tillemont in the 17th, states that Linus became bishop of Rome after the death of Peter.

LION, *Felis Leo*, the largest and most majestic of the *felidæ* and of carnivorous quadrupeds. It is, when mature, of a nearly uniform tawny or yellowish color, paler on the under-parts; the young alone exhibiting markings like those common in the felidæ; the male has, usually, a great shaggy and flowing mane; and the tail, which is pretty long, terminates in a tuft of hair. The whole frame is extremely muscular, and the fore-parts, in particular, are remarkably powerful; giving, with the large head, bright-flashing eye, and copious mane, a noble appearance to the animal, which, with its strength, has led to its being called the "king of beasts," and to fancies of its noble and generous disposition, having no foundation in reality. A lion of the largest size measures about 8 ft. from the nose to the tail, and the tail about 4 feet. The *lioness* is smaller, has no mane, and is of a lighter color on the under-parts. The strength of the lion is such that he can carry off a heifer as a cat carries a rat.

The lion is chiefly an inhabitant of Africa, although it is found also in some of the wilds of Asia, particularly in certain parts of Arabia, Persia, and India. It was anciently much more common in Asia, and was found in some parts of Europe, particularly in Macedonia and Thrace, according to Herodotus and other authors. It has disappeared also from Egypt, Palestine, and Syria, in which it was once common. The lion is not, in general, an inhabitant of deep forests, but rather of open plains, in which the shelter of occasional bushes or thickets may be found. The breeding-place is always in some much secluded retreat, in which the young—two, three, or four in a litter—are watched

over with great assiduity by both parents, and, if necessary, are defended with great courage—although, in other circumstances, the lion is more disposed to retire from man than to assail him or contend with him. When met in an open country, the lion retires at first slowly, as if ready for battle, but not desirous of it; then more swiftly; and finally by rapid bounds. If compelled to defend himself, the lion manifests great courage. The lion often springs upon his prey by a sudden bound, accompanied with a roar; and it is said that if he fails in seizing it, he does not usually pursue, but retires as if ashamed; it is certain, however, that the lion also often takes his prey by pursuing it, and with great perseverence. The animal singled out for pursuit, as a zebra, may be swifter of foot than the lion, but greater power of endurance enables him to make it his victim. Deer and antelopes are perhaps the most common food of lions. The lion, like the rest of the *felidæ*, is pretty much a nocturnal animal; its eyes are adapted for the night or twilight rather than for the day. It lurks generally in its lair during the day, and issues as night comes on, when its tremendous roar begins to be heard in the wilderness. It has a horror of fires and torch-lights; of which travelers in Africa avail themselves, when surrounded by prowling lions in the wilderness by night, and sleep in safety. Lion-hunting is, of course, attended with danger—a wounded and exasperated lion becoming a most formidable adversary—but besides the necessity of it to farmers in South Africa and other countries where lions abound, it has been found attractive to mere sportsmen from the excitement attending it. The rifle has proved too mighty for the lion wherever it has been employed against him, and lions rapidly disappear before the advance of civilization. In India, they are now confined to a few wild districts; and in South Africa, their nearest haunts are far from Cape Town and from all the long and fully settled regions.

The lion is easily tamed, at least when taken young; and when abundantly supplied with food is very docile, learning to perform feats which excite the admiration of the crowds that visit menageries. Exhibitions of this kind are not, however, unattended with danger, as too many instances have proved. Lions were made to contribute to the barbarous sports of the ancient Romans: a combat of lions was an attractive spectacle; and vast numbers were imported into Rome, chiefly from Africa, for the supply of the amphitheater. Pompey exhibited 600 at once.—Lions have not unfrequently bred in the menageries of Europe, and a hybrid between the lion and the tiger has occasionally been produced.

The mane of the lion, and the tuft at the end of the tail, are not fully developed till he is 6 or 7 years old. The tail terminates in a small prickle, the existence of which was known to the ancients, and which was supposed by them to be a kind of goad to the animal when lashing himself with his tail in rage. The prickle has no connection with the caudal vertebræ, but is merely a little nail or horny cone, about two lines in length, adhering to the skin at the tip of the tail.

There are several varieties of the lion, slightly differing from each other in form and color, but particularly in the development of the mane. The largest lions in the s. of Africa are remarkable for the large size of the head and the great and black mane. The Persian and other Asiatic lions are generally of a lighter color and inferior in size, strength, and ferocity to the African lion. Guzerat and the s. of Persia produce a somewhat smaller variety, remarkable as being almost destitute of mane.

LION, in heraldry. The lion holds an important place among the animals borne in coat-armor. As early as the 12th c., the king of beasts was assumed as an appropriate emblem by the sovereigns of England, Scotland, Norway, Denmark, the native princes of Wales, the counts of Flanders and Holland, and various other European potentates. Lions occur in different positions. 1. The earliest attitude of the heraldic lion is *rampant*, erect on his hind legs, and looking before him, the head being shown in profile, as he appears in the arms of Scotland, and originally did in those of England. This was the normal position of a lion; but as the royal animal came to be used by all who claimed kindred with royalty, and to be granted to favorite followers by way of augmentation, a diversity of attitude was adopted for distinction's sake. 2. *Rampant gardant*, erect on the hind legs, and affronté or full-faced. 3. *Rampant regardant*, erect on the hind legs, and looking backwards. 4. *Passant*, in a walking position, with the head seen in profile. 5. *Passant gardant*, walking, and with the head affronté. 6. *Passant regardant*, walking, and with the head looking behind. 7. *Statant*, with all the four legs on the ground. 8. *Saliant*, in the act of springing forward on his prey. 9. *Sejant*, rising to prepare for action. 10. *Sejant affronté*, as in the crest of Scotland. 11. *Couchant*, lying down, but with his head erect, and his tail beneath him. 12. *Dormant*, asleep, with his head resting on his fore-paws. 13. *Coward* or *coué*, with his tail hanging between his legs. The lion passant gardant is often blazoned as the *lion of England;* and at a time when terms of blazonry were comparatively few it was confounded with the leopard (q.v.), and hence the lion passant and rampant gardant came to be called respectively the *lion-leopardé* and *leopard-lionné*. Two lions may be depicted *rampant combatant*—i.e., face to face—or *rampant addossé*, placed back to back. Among leonine monsters we have two-headed lions, bicorporate and tricorporate lions, lion-dragons, and lion-poissons. There is also the Bohemian lion, with two tails, and the more celebrated winged lion of St. Mark, adopted by the republic of Venice. The island republic bore, azure, a lion winged or

sejant, holding between his fore-paws a book open argent, in which are the words *Pax tibi Marce Evangelista meus.* Two or more lions borne on one shield are sometimes (though never when on a royal coat) blazoned *lioncels.*

LIPANS, a warlike, uncivilized tribe of Indians, found in Texas and parts of Mexico. A few of the tribe were reported to be living in 1872 upon the reservation of the Mescalero Apaches in New Mexico.

LIP'ARI ISLANDS, a group of volcanic islands in the Mediterranean, 12 in number, are situated between lat. 38° 20′ and 38° 55′ n., long. 14° 15′ and 15° 15′ e., on the n. coast of Sicily, and comprised in the department of Messina. The intense volcanic action induced the ancient classical poets to localize in these islands the abode of the fiery god Vulcan—hence their ancient name, *Vulcaniæ Insulæ.* Their collective population is (1871) 12,020, 7,671 of whom are found in the island of Lipari, which, for extent and produce, is much the most important of the group. Lipari is about 18 m. in circuit. Its finest products are grapes, figs, olives, and corn. It has a large export trade in pumice-stone, sulphur, niter, sal-ammoniac, soda, capers, fish, and Malmsey wine, which is largely manufactured both for home and foreign trade. The warm springs of this island are much resorted to. The climate is delightful. Lipari, its chief town, is a bishop's see, possesses two harbors, an episcopal palace, hospital, gymnasium, and a castle built on a fine rock. Pop. '72, 6,047. The island is almost wholly composed of pumice-stone, and supplies all parts of the world with that article. Besides Lipari, the principal islands are Vulcano, Stromboli, Salini, Panaria, Felicudi, Alicudi, and Ustica; Stromboli and Vulcano are actively volcanic.

LI'PETZK, a t. in the s.w. of the government of Tambov, European Russia, on the right bank of the Voronetz, a tributary of the Don, was founded in 1700 by Peter the great, but only began to flourish at the commencement of the present century, when the admirable qualities of its chalybeate springs became known. At present it has a large annual influx of visitors during summer, for whose accommodation a bathing establishment and a splendid garden have been formed. Lipetzk has woolen manufactures. Pop. '67, 14,239.

LIP'OGRAM (Gr. *leipo,* to leave out, and *gramma,* a letter) is a species of verse characterized by the exclusion of a certain letter, either vowel or consonant. The earliest author of lipogrammatic verse was the Greek poet Lasus (b. 538 B.C.); and it is recorded of one Tryphiodorus, a Græco-Egyptian writer of the same period, that he composed an Odyssey in 24 books, from each of which, in succession, one of the letters of the Greek alphabet was excluded. Fabius Claudius Gordianus Fulgentius, a Christian monk of the 6th c., performed a similar feat in Latin. In modern times the Spaniards have been most addicted to this laborious frivolity. Lope de Vega has written five novels, from each of which one of the vowels is excluded; but several French poets have also practiced it. See Henry B. Wheatley's book on *Anagrams* (1862).

LIPPE, or, as it is generally called, LIPPE-DETMOLD, a small principality of northern Germany, surrounded on the w. and s. by Westphalia, and on the e. and n. by Hanover, Brunswick, Waldeck, and a detached portion of Hesse-Cassel. Area, 436 sq.m.; pop. '75, 112,442, nearly the whole of whom belong to the Reformed church and are very well educated. The present constitution of Lippe dates from Mar. 15, 1853; capital, Detmold (q.v.); other towns, Lemgo and Horn. The famous Teutoburg-Wald (*Saltus Teutoburgensis*), in which the legions of Varus were annihilated by Arminius (see GERMANICUS CÆSAR), runs through the southern part of the principality, which is on the whole rather hilly, but has many fertile valleys. The largest river is the Werre, a tributary of the Weser. The principal occupation of the inhabitants is agriculture and the rearing of cattle, sheep, and swine; much pains is likewise bestowed on the cultivation and management of forests, as Lippe is perhaps the most richly wooded district in Germany. Linen-weaving is the chief manufacturing industry of the country. Among the mineral products are marble, iron, lime, and salt. The princes of Lippe are one of the oldest sovereign families of Germany, and were in a flourishing condition as early as the 12th century. The first who took the name of Lippe was Bernhard von der Lippe, in 1129. The family split into three branches in 1613—Lippe, Brake, and Schaumburg.

LIPPE-SCHAUMBURG. See SCHAUMBURG-LIPPE, *ante.*

LIPPI, FRA FILIPPO, a Florentine painter of great talent, the events of whose life were of a very romantic kind. Born about 1412, left an orphan at an early age, he spent his youth as a novice in the convent of the Carmine at Florence, where his talent for art was encouraged and developed. Sailing for pleasure one day, he was seized by corsairs and carried to Barbary; after some years' captivity he regained his liberty, and is next found, in 1438, painting in Florence. Filippo was much employed by Cosmo de' Medici, and executed many important works for him. While painting in the convent of Sta. Margarita at Prato, a young lady, Lucrezia Buti, a boarder or novice, who had been allowed by the nuns to sit for one of the figures in his picture, eloped with him; and though strenuous efforts were made by her relations to recover her, he successfully resisted their attempts, supported, it is thought, by Cosmo; and she remained with and

had a son by him, who became an artist perhaps even more celebrated than Filippo himself. He died at Spoleto, Oct. 8, 1469, being at the time engaged in painting the choir of the cathedral along with Fra Diamante, one of his pupils.

LIPPI, FILIPPINO FILIPPO, commonly called FILIPPINO LIPPI, the son of Fra Filippo and Lucrezia Buti, was b. at Florence in 1460. It is said that his father left him to the care of Fra Diamante, his pupil. He afterwards studied under Sandro Botticelli, also a pupil of his father's, and one of the most celebrated of his school. He soon acquired a high reputation, and executed various works in Florence, Bologna, Genoa, Lucca, and at Rome, where, in 1492, he painted some frescos for the cardinal Caraffa, in the church of Sta. Maria Sopra Minerva. But the high position he attained is proved principally by his works in the Brancacci chapel in the church of the Carmine at Florence. The frescos in this chapel have always been held in the highest estimation; they have been studied by the most celebrated painters, among others by Raphael and Michael Angelo; and though long believed to be entirely the work of Masaccio, are now ascertained to have been commenced by Masolino, continued by Masaccio, and finished by Filippino; the works of the last being—"The Restoring of a Youth to Life," part of which was painted by Masaccio; "The Crucifixion of St. Peter;" "St. Peter and St. Paul before the Proconsul," and "St. Peter liberated from Prison;" also, according to some, "St. Paul visiting St. Peter in Prison," in which the figure of St. Paul was adopted by Raphael in his cartoon of "Paul preaching at Athens." Filippino died at Florence on April 13, 1505.

LIPPINCOTT, SARA JANE (CLARKE), b. at Pompey, N. Y., 1823; educated at Rochester, N. Y., and removed in 1843 to New Brighton, Penn. She began to write at an early age under the *nom de plume* of "Grace Greenwood." In 1853 she was married to Leander K. Lippincott, soon after which she traveled extensively in England and upon the continent. Among her works are *Greenwood Leaves; History of My Pets; Poems; Haps and Mishaps of a Tour in England; Merrie England; Stories from Famous Ballads; Records of Five Years;* and, *Life in New Lands.* She established in 1854 *The Little Pilgrim,* a paper for children, which for several years had a wide circulation. She has appeared extensively upon the platform as a lecturer and dramatic reader, and manifested a deep interest in the movement for the enlargement of woman's opportunities for education and remunerative work. She has also been a correspondent at Washington and other places of a number of the leading journals of the country. It is understood that she is deterred from literary labor at present by ill health.

LIPP'STADT, a t. of Prussian Westphalia, on the left bank of the Lippe, 78 m. n.e. from Cologne. Formerly belonging to Lippe, it became finally Prussian in 1851. It has a very considerable grain trade, and some manufactures of starch, brandy, woolen cloth, etc. Pop. '75, 8,160.

LIPSCOMB, ANDREW A., D.D., LL.D., b. in Georgetown, D. C., Sept. 6, 1816. His father's family removed to Virginia, and, in 1842, he went to Montgomery, Ala., where he won great distinction as a minister of the Methodist Protestant church. In 1860 he became chancellor of the university of Georgia, where he continued until 1874. In 1875 he accepted a professorship in the Vanderbilt university, Nashville, Tenn.

LIPSIUS, JUSTUS, 1547–1606; b. at Isque, near Brussels; educated at Brussels, Louvain, and the Jesuits' college at Cologne. The Jesuits, in view of his talents and learning, endeavored to draw him into their order, but were defeated by his removal, through the influence of his mother, to the university of Louvain. There, to his favorite studies of philology and philosophy, he added jurisprudence. His talent was precocious, and at the age of 19 he published in 1567 his first work, *Variæ Lectiones* of some of the principal Roman authors. This he dedicated to cardinal de Granville, who appointed him his Latin secretary. Accompanying the cardinal to Rome, he remained for two years, associating with learned men, and studying the MSS. in the Vatican and other libraries. In 1577, leaving Italy, he settled at Jena as professor of history and eloquence, and became a Protestant. In 1579 he became professor of history at Leyden, where he was held in high repute. Resigning in 1591 he retired to Spa and afterwards to Mentz, where, in the same year, he returned to the Roman Catholic church, and published two treatises in defense of the worship of saints and of their miraculous powers. While at Spa and Liege he was offered preferments by princes and dignitaries of the church; but he rejected the offers and returned to Louvain, where he was made professor of history and eloquence, remaining there till his death. Of his numerous works the most important are: *De Constantia Manuductia ad Philosophiam Stoicam; Physiologiæ Stoicorum libri tres; De Militia Romana libri quinque.* His commentary on Tacitus was the work in which he chiefly distinguished himself. His works were collected under the title of *Opera Omnia.* At his death he was historiographer to the king of Spain.

LIPSIUS, JUSTUS HERMANN, b. at Leipsic, May 9, 1834; in 1866 became rector of a gymnasium in that city, and has published critical remarks on *Sophocles* and *Lysias.*

LIPSIUS, RICHARD ADELBERT, b. at Gera (Reuss), Germany, Feb. 14, 1830; studied at Leipsic, and became professor of theology there in 1859; in 1861 he was appointed professor of theology at Vienna; in 1865 at Keil. He has published *The Pauline Doctrine of Justification; The First Epistle of Clement of Rome; On Gnosticism; On the Sources of*

the Writings of Epiphanius; The Catalogue of Popes in Eusebius; Chronology of the Bishops of Rome to the Middle of the Fourth Century, and numerous articles in German periodicals.

LIPTO', a co. of n. Hungary, drained by the Wang, an affluent of the Danube; 872 sq.m.; pop. in '70, 79,273, mostly Slavs. The inhabitants are engaged chiefly in agriculture and the raising of cattle; but there are mines of gold, silver, copper, and iron. Capital, Szent-Miklós.

LIQUATION, or ELIQUATION, a method of reducing silver ores by means of a triple alloy of copper, silver, and lead, which, being cast into disk-shaped masses, are placed on edge in a furnace on an inclined plane of iron, containing a small channel, and raised to a red heat; the lead, on melting out, by its attraction for silver, carries that metal with it, leaving the copper as a reddish-black spongy mass.

LIQUEUR. This name is given to any alcoholic preparation which is flavored or perfumed and sweetened to be more agreeable to the taste; there is consequently a large class of liqueurs, of which the following are the principal: *aniseed cordial*, prepared by flavoring weak spirit with aniseed, coriander, and sweet fennel seed, and sweetening with finely clarified syrup of refined sugar. *Absinthe* is sweetened spirit flavored with the young tops of certain species of artemisia (q.v.). *Clove cordial*, much sold in the London gin-shops, is flavored with cloves, bruised, and colored with burned sugar.

Kümmel, or *doppel-kümmel*, is the principal liqueur of Russia; it is made in the ordinary way with sweetened spirit, flavored with cumin and caraway seeds, the latter usually so strong as to conceal any other flavor. It is chiefly made at Riga, and there are two qualities: that made in Riga is the sort in common use, and is not the finest; the better sort is only manufactured in smaller quantities at Weissenstein, in Esthonia; the chief difference is in the greater purity of the spirit used. *Maraschino* is distilled from cherries bruised, but instead of the wild kind, a fine, delicately flavored variety, called *marazques*, grown only in Dalmatia, is used. This cherry is largely cultivated around Zara, the capital, where the liqueur is chiefly made. Great care is taken in the distillation to avoid injury to the delicate flavor, and the finest sugar is used to sweeten it.

Noyau, or *crême de noyau*, is a sweet cordial flavored with bruised bitter-almonds. In Turkey, the fine-flavored kernels of the Mahaleb cherry are used, and in some places the kernels of the peach or the apricot. *Peppermint*, a common liqueur, especially amongst the lower classes of London, where very large quantities are sold; it usually consists of the ordinary sweetened gin, flavored with the essential oil of peppermint, which is previously rubbed up with refined sugar, and formed into an oleosaccharum, which enables it to mix with the very weak spirit.

Curaçoa and *kirschwasser* are described under their own names.

LIQUID, a consonant pronounced by a closure of the vocal organs greater than is required in the utterance of the closer vowels, but less than is demanded by the mute consonants. The liquid consonants are *l, r, w, y*, which are all subject to whispered aspiration.

LIQUIDAM'BAR, a genus of trees of the natural order *altingiaeæ*, and the only genus of the order, having flowers in male and female catkins on the same tree, the fruit formed of two-celled, many-seeded capsules, and the seeds winged. They are tall trees, remarkable for their fragrant balsamic products. *L. styraciflua*, the AMERICAN LIQUIDAMBAR, or SWEET GUM tree, is a beautiful tree with palmate leaves, a native of Mexico and the United States. It grows well in Britain. Its wood is of a hard texture and fine grain, and makes good furniture. From cracks or incisions in the bark, a transparent, yellowish balsamic fluid exudes, called *liquid liquidambar, oil of liquidambar, American storax, copalm balsam*, and sometimes, but erroneously, *white balsam of Peru*. It gradually becomes concrete and darker colored. Its properties are similar to those of storax. That of commerce is mostly brought from Mexico and New Orleans.—*L. orientale*, a smaller tree with palmate leaves, is a native of the Levant and of more eastern regions, and yields abundantly a balsamic fluid, which has been supposed to be the *liquid storax* imported from the Levant, but on this point there is diversity of opinion.

LIQUIDATED DAMAGES. The amount of damages fixed beforehand by the terms of an agreement as the definite sum to be paid by the party to such agreement who violates such agreement. The courts, which construe strictly and will relieve against penalties, will in general support a stipulation for liquidated damages for a breach of contract, but they will hold any particular stipulation to be either a penalty or liquidated damages, according as they determine the intent of the parties as evidenced by the tenor of the whole instrument. If that intent be still ambiguous, the stipulation will be declared a penalty. But if it appear that there is no means to properly find out the damages sustained, the stipulation will be held to be an agreement for liquidated damages, even if it be called a penalty in the agreement itself.

LIQUIDS. See HEAT, HYDROSTATICS, and FUSING AND FREEZING POINTS.

LIRA (Lat. *libra;* see LIVRE), an Italian silver coin of greater or less value, according to time and place. The Tuscan lira was equal to 80 French centimes; the Austrian lira or *zwanziger* was about the same value. The present lira Italiana, or lira nuova, of the Italian kingdom is equal to the French franc, and is divided into 100 centimes.

LI'RIA, a t. of Spain, in the province of Valencia, and 12 m. n.w. from Valencia. The plain in which it stands is luxuriant with vines and olives. On the summit of a hill in the vicinity is the *collegio de San Miguel,* an ancient and venerable monastic pile. Pop. 8,500.

LIRIODEN'DRON. See TULIP TREE.

LISAINE, BATTLE OF, a famous engagement in the Franco-Prussian war, which raged for three days on the small French river Lisaine, which rises at the southern termination of the Vosges, flows w. of the fortress of Belfort, and enters the Savoureuse at Montbéliard. The German gen. von Werder retreated before the French under Bourbaki, and took a position along the Lisaine, in order to prevent the French from attacking the German troops before Belfort, or from making an invasion at that point into Germany. Von Werder, with a force of 43,000 men, well supplied with heavy guns, held a distance of about 10 m. on the left bank of the river, which commands the right bank. The villages along the stream were barricaded. Bourbaki, with 120,000 men, made desperate efforts to drive the Germans from their position, but the latter were so strongly fortified that these efforts were without avail. It was one of the severest engagements of the war. The German loss in killed and wounded was 81 officers and 1847 men; the French loss was 6,000.

LIS'BON (Portug. *Lisboa;* called by the ancient Lusitanians *Olisipo* or *Ulisippo,* and by the Moors *Lishbuna*), the capital of Portugal, is situated in the province of Estremadura, on the right bank of the Tagus, which is here about 6 m. wide, and about 18 m. from the mouth of the river. Pop. 224,063. The city is built partly on the shores of the Tagus, and partly on three larger and four smaller hills. Its appearance is wonderfully picturesque; and its resemblance, in point of situation and magnificence of prospect, to Constantinople, at precisely the opposite extremity of Europe, has been frequently remarked. Including its suburbs, it extends about 5 m. along the river. The harbor, which is safe and spacious, is protected by strong forts, but the city itself is unwalled and without any fortifications. The eastern and older part, which lies around the Castle-hill—an eminence crowned with an old Moorish castle, destroyed by earthquakes—is composed of steep, narrow, crooked, badly-paved streets, with high, gloomy, wretched-looking houses; but the newer portions are well and regularly built. The most beautiful part is called the *New Town*—it stretches along the Tagus, and is crowded with palaces. Among the places or squares, the principal are the *Praço do Commercio,* on the Tagus, 565 ft. long, 520 broad, surrounded on three sides with splendid edifices; the *Praço do Rocio,* in the new town, forming the market-place, 1800 ft. long and 1400 broad; and the *Passeio Publico.* The whole of the new town, and the district round the royal castle, is lighted with gas. Lisbon has 70 parish churches, 200 chapels, numerous monasteries, hospices, and hospitals, 6 theaters, and 2 amphitheaters. The most conspicuous public buildings are the church of the Patriarch, the monastery of the Heart of Jesus (with a cupola of white marble), the church of St. Roque (built of marble), the Foundling hospital (receiving annually about 1600 children), St. James's hospital (capable of receiving 1,600 sick persons), the royal palaces of Ajuda, *Nossa Senhora das Necessidades,* and Bemposta, the custom-houses, the arsenal, and the National theater, on the site of the old inquisition. The city has numerous educational and scientific institutions, and a national library containing 160,000 vols. Among notable objects, the most important is the Alcántara aqueduct, *Os Arcos* or *Aguas livres,* finished in 1743, which supplies all the public fountains and wells of the city. It is 18 m. in length, and in one place 260 ft. high, and remained uninjured at the great earthquake. It is the greatest piece of bridge-architecture in the world. Lisbon has a royal arsenal, ship-building docks, and powder-mills, besides private manufactories of silks, porcelain, paper, and soap; also iron-foundries, and jewelry and trinket establishments. Its chief exports are oranges, citrons, wool, oil, and leather. The shipping accommodation is extensive and commodious, and the trade with Africa is an important and flourishing one. The imports in 1875 were valued at £3,880,295; and the exports at £1,839,507. About 30,000 Galegos (Galicians) earn a subsistence here as porters, water-carriers, and laborers.

Lisbon is said to have been founded by the Phenicians, a ndwas a flourishing city, the capital of Lusitania, when first visited by the Romans. It was taken by the Moors in 712, from whom it was recaptured by Alfonso I. in 1147. It became the seat of an archbishopric in 1390, and of a patriarchate in 1716. Lisbon has been frequently visited by earthquakes; that of 1755 destroyed a great part of the city and 60,000 inhabitants. It was captured by the French in 1807, but given up to the British in 1808, after which it was protected by the lines of Torres Vedras.

LIS'BURN, a market t. and parliamentary borough, situated on the river Lagan, partly in the county of Antrim, partly in the county of Down, Ireland. It is distant from Dublin 97 m. n.n.e., and 8¼ s.s.w. from Belfast, with both which places it is connected by the Dublin and Belfast Junction railway. The pop. in 1871 was 9,326; of whom 4,708 were Protestant Episcopalians, 2,146 Roman Catholics, 1841 Presbyterians, 369 Methodists, and the rest of other denominations. Lisburn originated in the erection of a castle, in 1610, by sir Fulk Conway, to whom the manor was assigned in the settlement of James I.; but its importance dates from the settlement of a number of Hugue-

not families, who, after the revocation of the edict of Nantes, established themselves at Lisburn, where they introduced the manufacture of linen and damask, after the method and with the machinery then in use in the Low Countries. It is a clean and well-ordered town, with a convenient market, and considerable manufactures of linens and damasks; besides which, bleaching, dyeing, flax-dressing, flax-spinning, etc., are carried on. Its parish church is the cathedral of Down and Connor, and is interesting as the burial-place of Jeremy Taylor, who was bishop of that see, and died at Lisburn in 1667. Lisburn returns one member to parliament.

LISIEUX (ancient *Noviomagus Lexovium*), a t. of northern France, in the dep. of Calvados, on the Touques, 27 m. e.s.e. of Caen, at the entrance of a beautiful valley. The principal building is the church of St. Pierre (formerly a cathedral), belonging to the 13th c., and built on the site of an older edifice, in which Henry II. of England married Eleanor of Guienne. Lisieux is the center of an extensive manufacture of coarse linens, woolens, flannels, horsecloths, ribbons, etc., which gives employment to more than 3,000 workmen. Pop. '76, 18,396.

LISKEARD, a municipal and parliamentary borough in Cornwall, is situated in a well-cultivated district, on the Looe, 16 m. w.n.w. of Plymouth. Two miles to the s. of the town is a famous spring, said to have been presented to the inhabitants by St. Keyne, and the virtue of whose waters is set forth in Southey's well-known ballad, *The Well of St. Keyne*. There are manufactures of serge and leather, and considerable traffic in the produce of the tin, copper, and lead mines of the neighborhood. Liskeard returns a member to parliament. Pop. '71, 6,575.

LISLE, GUILLAUME DE, 1675–1726; son of Claud de Lisle, geographer and historian; b. in Paris. At an early age he devoted himself to historical and geographical studies, and when but 9 years old constructed several charts of ancient history. He completely reconstructed the system of geography current in Europe at the beginning of the 18th c. by the publication of maps in which he corrected errors inherited from the time of Ptolemy. He also constructed a celestial and a terrestrial globe. He was admitted to the academy of sciences in 1702, and afterwards appointed tutor in geography to Louis XV., who created for him in 1818 the title of "first geographer to the king," with a pension of 1200 livres. He is said to have drawn no less than 134 maps. A corrected edition of his map of the world appeared in 1724. He contributed several memoirs to the *Collections* of the academy of sciences.

L'ISLET, a s. co. of the province of Quebec, Canada, bounded s.e. by Maine and n.w. by the St. Lawrence; traversed by the Grand Trunk railroad; 793 sq.m.; pop. '71, 13,517, of whom 13,375 were of French descent. Capital, St. Jean Port Joli.

LISMORE, an island of Argyleshire, 6 m. from Oban, is situated in Loch Linnhe, and is 10 m. in length, with an average breadth of 1½ miles. It contains the remains of several interesting buildings, as Achinduin castle—formerly the residence of the bishops of Argyle—an old cathedral, and castle Rachal, a Scandinavian fort, now very ruinous. The island is for the most part under cultivation. Pop. '71, 703.

LIS PENDENS, a pending suit. Pendency of a suit begins, at law, as soon as an attachment is made under the writ; at equity, with the service of the subpœna on the defendant. Every one who takes any step in regard to the property affected by the pending suit is presumed at equity to have notice of such suit, and his rights will be correspondingly affected; thus, a purchaser of such property, though never made party to the suit, takes subject to the decree made in it; and a suit pending, brought by a prior mortagee whose mortgage has never been put on record, is held sufficient notice to a following mortagee of the existence of the prior mortgage. Though these applications of *lis pendens* occur only in courts of equity, the legal doctrine, that a vendee holds by the same title as his vendor, and no better, amounts to much the same thing.

LISSA, anciently *Issa*, an island in the Adriatic, off the Dalmatian coast, and belonging to Dalmatia; 10 m. long, 5 broad; 43° 10′ n. lat., 33° 51′ e. long.; 38 sq.m.; pop. 7,000. It was long known to the ancients, and is mentioned by Scylax as a Greek colony. In Cæsar's time it was styled *nobilissimum earum regionum oppidum*, and Pliny says the inhabitants were Roman citizens. It is often referred to by Polybius in his account of the Illyrian war. When besieged by Teuta, the siege was raised on the appearance of the Roman fleet, and the inhabitants placed themselves under the protection of Rome. It was afterwards a station for the Roman galleys in their wars with the kings of Macedon. Its shores are steep and rocky, and it is accessible only at a few bays. The soil is not fertile. The chief products are wine, oil, almonds, and anchovies. The island is noted in modern times for two victories, that gained by the British over the French in 1811, and that by the Austrians under gen. Tegethoff over the Italians under admiral Persano. Its two harbors are strongly fortified. Lissa or San Giorgio is the principal town and seaport on the n.e. shore, with a population of 2,800.

LISSA (Pol. *Leszna*), a t. of Prussia, in the province of Posen, and the circle of Fraustadt, 44 m. s.s.w. of Posen. Pop. '75, 11,069, of whom nearly one half are Jews. Lissa has a fine town-house, a castle, one Roman Catholic and three Protestant churches, with manufactures of woolens, leather, and tobacco. This place became for a time the chief seat of the Bohemian brothers.

LIST. See FILLET.

LIST, FRIEDRICH, 1789–1846; b. Reutlingen in Würtemberg; was for two or three years professor of political economy at the university of Tübingen; was elected member of the diet of Würtemberg, but was expelled in 1822 for his censure of the acts of the government, and condemned to ten months' imprisonment. He fled to Switzerland and Alsace, but returning in 1824 was imprisoned in the fortress of Asperg. Having received a pardon he emigrated to America and settled in Pennsylvania. In 1827 he published his *Outlines of a New System of Political Economy*, which attracted much attention. He became a large land-holder, and in connection with others settled the two towns of Port Clinton and Tamaqua in Schuylkill county. On the latter he discovered a valuable deposit of anthracite. At this time he was much interested in the establishment of railroads. In 1830 he was appointed U. S. consul at Hamburg, but soon came back to Pennsylvania, and in 1832 returned to Europe, acting for a while in 1833 as American consul at Leipsic. In 1837 he went to Paris, where he wrote several letters for the Augsburg *Allgemeine Zeitung*, which were afterwards published in a volume under the title of *Das Nationale System der Politischen Oekonomie*. In 1843 he established at Augsburg the *Zollvereinsblatt*, in which he advocated a national commercial system and a national fleet. He visited Austria and Hungary in 1844, and England in 1846 for the purpose of forming a commercial alliance between Germany and that country, in which his efforts were not successful. Depressed by the failure of his plans, the loss of his health and property, he shot himself in a fit of insanity. His works, with a biography, were published in 3 volumes in 1850 at Stuttgart.

LISTON, JOHN, 1776–1846; b. London; educated at Dr. Barrow's school; became second master of St. Martin's school, founded by archbishop Tenison. For acting in theatrical plays with the large boys he was expelled from the school, and went upon the stage, excelling in low comedy. He acted at the Haymarket theater in 1806, and afterwards at Covent Garden, Drury Lane, and the Olympic. He was greatly praised by Lamb, Hood, and others. He left the stage in 1837, having acquired a considerable fortune.

LISTON, ROBERT, a celebrated surgeon, was b. at Ecclesmachan, in the county of Linlithgow, in 1794, and was the son of the rev. Henry Liston, the minister of the parish. After studying anatomy under Barclay in Edinburgh, and following the usual course of medical study in that city, he proceeded to London in 1816, where he attended the surgical practice of the Blizards at the London hospital, and of Abernethy at St. Bartholomew's. After becoming a member of the royal college of surgeons of London, he returned to Edinburgh, and in 1818 was elected a fellow of the royal college of surgeons of that city.

Liston now commenced his career as a lecturer on anatomy and surgery, and soon became remarkable for his boldness and skill as an operator. In consequence of his performing many successful operations on patients who had been discharged as incurable by the surgeons of the Edinburgh infirmary, he was requested by the managers to refuse his assistance to any person who had been a patient in that institution, and to abstain from visiting the wards. He naturally declined to accede to these extraordinary propositions, and in consequence was expelled, and never entered again its wards, until in 1827 he was elected one of its surgeons. His surgical skill, and the rapidity with which his operations were performed, soon acquired for him a European reputation; and in 1835 he accepted the invitation of the council of University college to fill the chair of clinical surgery. He soon acquired a large London practice; in 1840 he was elected a member of the council of the college of surgeons; and in 1846 he became one of the board of examiners. In the very climax of his fame, and apparently in the enjoyment of vigorous health, he was struck down by disease, and died Dec. 7, 1847.

His most important works are his *Elements of Surgery*, which appeared in 1831, and his *Practical Surgery*, which appeared in 1837, and has gone through four editions. His uncontrollable temper, and the coarseness of language in which he frequently indulged, involved him in various quarrels with his professional brethren; yet, notwithstanding these defects, he always succeeded in obtaining the regard and esteem of his pupils.

LISZT, FRANZ, pianist, was b. at Raiding, in Hungary, Oct. 22, 1811. His father, a functionary employed on the estates of prince Esterhazy, was himself possessed of some musical skill, and carefully cultivated the wonderful talent which Liszt showed even in his infancy. In his ninth year, the child played publicly at Presburg, and excited universal astonishment. By the assistance of two Hungarian noblemen—counts Amadi and Sapary—Liszt was sent to Vienna, and placed under the instruction of Czerny and Salieri. He studied assiduously for eighteen months, after which he gave concerts in Vienna, Munich, and other places, with brilliant success. In 1823 he proceeded with his father to France, intending to complete his musical education at the conservatoire; but he was refused admission on account of his being a foreigner; nevertheless, his genius made a way for itself. He played before the duke of Orleans, and very soon the clever, daring boy became the favorite of all Paris. Artists, scholars, high personages, ladies—all paid homage to his marvelous gift, and it was only owing to his father's

strict supervision that young Liszt was not entirely spoiled. In the course of the next three years, he visited England thrice, and was warmly received. In 1827 his father died at Boulogne, and Liszt became his own master at the age of sixteen. For some years after this, his life sufficiently proved that he had become independent too soon. Alternations of dissipation and religious mysticism induced his admirers to fear that his artistic course would end in disastrous failure. Fortunately, he heard the famous violinist, Paganini, in 1831, and was seized with a sudden ambition to become the Paganini of the piano; and one may say that on the whole he has succeeded. Up till 1847 his career was a perpetual series of triumphs in all the capitals of Europe. He then grew tired of his itinerant life, and became leader of the court concerts and operas at Weimar. In 1865 he took sacred orders and became a monk, in the chapel of the Vatican, Rome; and in 1871 returned to his native country, which granted him a pension of £600 a year. In 1875 he was named director of the Hungarian academy of music. Liszt has also been an industrious and original contributor to musical literature.

LITANY (Gr. *litaneia*, a supplication), a word the specific meaning of which has varied considerably at different times, but which means in general a solemn act of supplication addressed with the object of averting the divine anger, and especially on occasions of public calamity. Through all the varieties of form which litanies have assumed, one characteristic has always been maintained—viz., that the prayer alternates between the priest or other minister, who announces the object of each petition, and the congregation, who reply in a common supplicatory form, the most usual of which was the well-known "Kyrie eleison!" (Lord, have mercy!) In one procession which Mabillon describes, this prayer, alternating with "Christe eleison," was repeated 300 times; and in the capitularies of Charlemagne, it is ordered that the "Kyrie eleison" shall be sung by the men, the women answering "Christe eleison." From the 4th c. downwards, the use of litanies was general. The *Antiphonary* of St. Gregory the great contains several. In the Roman Catholic church three litanies are especially in use—the "litany of the saints" (which is the most ancient), the "litany of the name of Jesus," and the "litany of Our Lady of Loretto." Of these, the first alone has a place in the public service-books of the church, on the rogation-days, in the ordination service, the service for the consecration of churches, the consecration of cemeteries, and many other offices. Although called by the name of litany of the saints, the opening and closing petitions, and indeed the greater part of the litany, consist of prayers addressed directly to God; and the prayers to the saints are not for their help, but for their intercession on behalf of the worshipers. The litany of Jesus consists of a number of addresses to our Lord under his various relations to men, in connection with the several details of his passion, and of adjurations of him through the memory of what he has done and suffered for the salvation of mankind. The date of this form of prayer is uncertain, but it is referred, with much probability, to the time of St. Bernardino of Siena, in the 15th century. The litany of Loretto (see LORETTO) resembles both the above-named litanies in its opening addresses to the holy Trinity, and in its closing petitions to the "Lamb of God, who taketh away the sins of the world;" but the main body of the petitions are addressed to the Virgin Mary under various titles, some taken from the Scriptures, some from the language of the fathers, some from the mystic writers of the mediæval church. Neither this litany nor that of Jesus has ever formed part of any of the ritual or liturgical offices of the Catholic church, but there can be no doubt that both have in various ways received the sanction of the highest authorities of the Roman church.

In the prayer-book of the English church the litany is retained, but although it partakes of ancient forms, it differs from that of the Roman church, and contains no invocation of the Virgin or the saints. It is divided into four parts—invocations, deprecations, intercessions, and supplications, in which are preserved the old form of alternate prayer and response. It is no longer a distinct service, but, when used, forms part of the morning prayer.

LITCH'FIELD, a co. of Connecticut, forming its n.w. corner, and bounded n. by Massachusetts and w. by the state of New York; intersected by the Housatonic, Farmington, and Naugatuck rivers, and by the Housatonic, Naugatuck, and Connecticut Western railroads; about 900 sq.m.; pop. in '80, 52,043, of whom 44,609 were of American birth. The surface is hilly, and extensively covered with forests. The soil is for the most part fertile; hay, butter, cheese, tobacco, cattle, oats, and corn being the staple productions. The quantity of hay and butter produced in this county in 1870 exceeded that of the same articles in any other county of the state. The production of staples in 1870 was: 6,822 bush. of wheat, 50,444 of rye, 236,900 of corn, 257,606 of oats, 27,561 of buckwheat, 319,497 of potatoes, 1,048,569 lbs. of tobacco, 51,759 of wool, 1,617,850 of butter, 1,307,396 of cheese, and 109,415 tons of hay. There were in the county at the same time 6,076 horses, 22,514 milch cows, 6,482 working oxen, 17,477 other cattle, 17,824 sheep, and 7,232 swine. Water-power is abundant, and there is in the county a great variety of manufactures, including such articles as agricultural implements, brass and brass-ware, pins, carriages, cotton goods, cutlery and edge-tools, hardware, hats and caps, iron and machinery, needles, paper, plated ware, silk goods, tin, copper and sheet-iron ware, woolen and worsted goods, leather, flour, and lumber. Capital, Litchfield.

LITCHFIELD, a t., the county seat of Litchfield co., in n.w. Connecticut; pop. '80, 3'410. About 1800 ft. above the level of the sea, it is noted for the invigorating purity of its summer climate, and has become a favorite resort of summer boarders from New York. It is on high ground, between the Naugatuck and Shepaug rivers, near a beautiful lake, the largest in the state. The noble elms of the old streets and picturesque surrounding scenery have long made it celebrated. In 1784 a law school was established here by judge Tapping Reene, and conducted by judge James Gould from 1823 to 1838, which was at the time the most celebrated in the United States. Many of the most eminent jurists and statesmen of the country graduated there. The first ladies' seminary in the United States was established in Litchfield. The town had social refinement and culture; and Dr. Lyman Beecher gave celebrity to its pulpit (Congregational). Water-power from its lake has made it the seat of many manufacturing industries, including mills, for making paper, oil, satinets, and smelters for reducing and refining nickel ores found in the vicinity. The town is subdivided into five postal districts, viz.: Litchfield, Bantam Falls, East Litchfield, Milton, and Northfield. It has a private lunatic asylum, and the usual quota of public schools, churches, newspapers, and business houses.

LITCHFIELD, a city of Montgomery co., Ill., on the Indianapolis and St. Louis railroad, where it crosses the Wabash railroad, 45 m. s. of Springfield, and 50 m. n.e. of St. Louis. It is situated on a fine rolling prairie, and is the most populous town in the county. It has 7 churches, an Ursuline convent and academy, a high school, a Roman Catholic hospital, 2 newspapers, 2 banks, 2 steam flouring mills, workshops of the Indianapolis and St. Louis railroad, and several grain elevators. Pop. about 5,000.

LITCHI, or LEE-CHEE, *Nephelium Litchi*, one of the most delicious fruits of China and of the Malayan archipelago. The tree which produces it belongs to the natural order *lapindaceæ*, and has pinnate leaves. It is extensively cultivated in the southern provinces of China, and in the northern provinces of Cochin-China, but is said to be impatient of a climate either much more hot or much more cold. The fruit is of the size of a small walnut, and grows in racemes. It is a red or green berry, with a thin, tough, leathery, scaly rind, and a colorless semi-transparent pulp, in the center of which is one large dark-brown seed. The pulp is slightly sweet, subacid, and very grateful. The Chinese preserve the fruit by drying, and in the dried state it is now frequently imported into Britain, still preserving much richness of flavor.—The *longan* and *rambutan* are fruits of the same genus.

LITER, the unit of the present French measures of capacity, both dry and liquid. It is the volume of a cubic decimeter (see METER), and is equal to 0.2200967 British imperial gallon. It is subdivided decimally into the *deciliter*, *centiliter*, and *milliliter* (respectively $\frac{1}{10}$th, $\frac{1}{100}$th, and $\frac{1}{1000}$th of a liter). Ten liters are a *decaliter;* 100, a *hectoliter;* 1000, a *kiloliter*. The hectoliter is the common measure for grain, and is equal to 0.3439009 British imperial quarter, or nearly $2\frac{3}{4}$ imperial bushels.

LITER. See METRIC SYSTEM.

LITERARY PROPERTY (aside from copyright, trade-mark, and patent), the ownership by an author of his writings, apart from any connection with their publication or promulgation. In this sense the title is in the material and form of its subject, and not in any quality predicated on its market value; as, for instance, the abstract property which the author has in his unpublished play, and which, in this sense, is neither more nor less than that which inheres in the authorship of a letter. But it is to be observed that this property is not mere ownership; as in the case of an article which is a gift, a purchase, or a bequest. The title rests on the fact of creation, and is more akin to the interest which a father has in the productive capacity or earning faculty of his children than to anything else. To illustrate the specific distinction which characterizes this species of property, it may be observed that the author who inscribes and presents a written copy of verses to his friend does not, by these acts, part with this peculiar title. The recipient may give away the copy of verses, that being his; but if, by any chance, incident, or collusion, those verses are made public, the one to whom they were given becomes liable to prosecution therefor. The law holds this property to be transferable, by bequest, or by regular order of succession, or absolute gift, clearly stated. It cannot be seized by creditors for publication, and its unauthorized publication will be restrained in equity. Literary property is held at common law, but in the United States the copyright act recognizes the right of property in any manuscript whatever, including private letters.

LITERATURE, AMERICAN. See AMERICAN LITERATURE.

LITHARGE. See LEAD.

LITHGOW, WILLIAM, 1583–1614; b. Scotland; a traveler, who began by traveling on foot through central Europe, Italy, Greece, Turkey, Egypt, and Palestine, and presented a collection of relics to James I. and the queen on his return to England. His next tour was through the states of northern Africa, and through Hungary and Poland on his return. On his third journey he bore letters from king James commending him to all the royal heads of the countries which he might visit. At Malaga he was arrested on suspicion of being a spy, and subjected to shameful tortures. His *Adventures* were published in 1614.

LITHIA. See LITHIUM.

LITHIC ACID. See URIC ACID.

LITHIC ACID DIATH'ESIS is the term employed in medicine to designate the condition in which there is an excess of lithic (or uric) acid, either free or in combination, or both, in the urine. The urine of persons who have the lithic acid diathesis is usually of a dark golden color, like brown sherry, and is more acid, of higher specific gravity, and less abundant than the urine in health. When the urine cools, there is usually a deposit or sediment of lithates. The sediment is usually spoken of as one of lithate (or urate) of ammonia, but in reality it consists mainly of lithate of soda mixed with lithates of ammonia, potash, and lime. Its color varies according to the amount and nature of the urine-pigment which tenaciously adheres to it, so that its tints vary from a whitish yellow to a brick-dust red, or even a deep purple. Persons seeing these deposits in their urine when it has cooled are very apt to believe that they may aggregate and harden in the bladder, and form a stone. Such fears may, however, be relieved by heating the urine containing the sediment to the temperature of the interior of the body (about 100°), when the fluid will resume its original clearness, and the sediment will disappear.

The color of the deposit is of considerable importance in determining its value as a morbid symptom. Tawny or reddish sediments of this kind are frequently the result of mere indigestion or a common cold; the yellowish-white ones deserve more attention, as they are believed frequently to precede the excretion of sugar through the kidneys. The pink or brick-dust sediments are almost always associated with febrile disturbance or acute rheumatism; and if these sediments are habitual, without fever, there is most probably disease of the liver or spleen. If the urine is very acid, a portion of the lithic acid is separated from its base, and shows itself, as the fluid cools, in a free crystallized state, resembling, to the naked eye, grains of cayenne pepper, but appearing under the microscope as rhombic tablets. This free lithic acid is far less common than the lithates, and does not dissolve on the application of heat.

The persons who suffer from this diathesis are chiefly adults beyond the middle age, and of indolent and luxurious or intemperate habits. As the formation of lithic deposits is due to over-acidity of the urine, alkalies are the medicines most commonly prescribed, and the preparations of potash are far preferable to those of soda, because lithate of potash is perfectly soluble, and will pass off dissolved in the urine, while lithate of soda is a hard, insoluble salt.

Regimen is, however, of far more use than medicine in the lithic acid diathesis. The patient should dine moderately and very plainly, avoiding acid, saccharine, and starchy matters and fermented liquors. The skin should be made to act freely by friction, and by occasional warm or daily tepid baths. Warm clothing must be used; plenty of active exercise must be taken in the open air; and the healthy action of the bowels and liver duly attended to. It must be recollected that the lithates are sometimes thrown down, not from undue acidity of the urine, but simply from that fluid not containing the due quantity of water to hold them in solution. In such cases a tumbler of cold spring-water taken night and morning will at once cause the cessation of this morbid symptom.

LITH'IUM (symb. Li; equiv. 7.0; sp. gr. 0.5936) is the metallic base of the alkali *lithia*, and derives its name from the Greek word *lithos*, a stone. The metal is of a white silvery appearance and is much harder than sodium or potassium, but softer than lead. It admits of being welded at ordinary temperatures, and of being drawn out into wire, which, however, is inferior in tenacity to leaden wire. It fuses at 356°. It is the lightest of all known metals, its specific gravity being little more than half that of water; it decomposes water at ordinary temperatures. It burns with a brilliant light in oxygen, chlorine, and the vapors of iodine and bromine. It is easily reduced from its chloride by means of a galvanic battery. Lithium forms two compounds with oxygen, viz., lithia (known also as lithion or lithon), which is the oxide of lithium, and a peroxide of lithium whose formula has not been determined.

Lithia, in a pure and isolated state, cannot be obtained. Hydrate of lithia (LO,HO) occurs as a white translucent mass, which closely resembles the hydrates of potash and soda. The salts of lithia are of sparing occurrence in nature. The minerals petalite, triphane, lepidolite, and tourmaline contain lithia in combination with silicic acid, while triphyline and amblygonite contain it as a phosphate; it is also present in small quantities in many mineral waters.

Carbonate of lithia (LO,CO_2) is precipitated when carbonate of ammonia is added to a strong solution of chloride of lithium, and occurs as a white mass with a slight alkaline reaction. At a dull red heat, it melts into a white enamel. It requires 100 parts of water for its solution, but is more soluble in water charged with carbonic acid. The solution of the salt has been strongly recommended in cases of gout and gravel, in consequence of the solvent power which it exerts on uric acid. The sulphate, phosphate, and nitrate of lithia are of no special importance. Chloride of lithium (LCl+4 aq.) is readily prepared by dissolving the hydrate of lithia in hydrochloric acid, and evaporating. It crystallizes in octohedra, and is one of the most deliquescent salts known. It is of importance as being the source from whence lithium and carbonate of lithia are obtained.

Lithia was discovered in 1817 by Arfvedson. The metal lithium was first obtained in 1822 by Brande, but nothing was known regarding its properties until 1855, when Bunsen and Matthiessen discovered the present method of obtaining it, and carefully investigated its physical and chemical characters.

LITHOD'OMUS, a genus of stone-boring mollusks belonging to the family of mussels, the type of which is the *Mytilus lithophagus* of Linnæus.

LITHOG'RAPHY (Gr. *lithos*, a stone), the art of printing from stone, was invented by Aloys Senefelder, at Munich, about the end of the 18th century. It consists, first, in writing and drawing on the stone with the pen and brush, with the graver, and with the crayon or chalk; or in transferring to the stone writings and drawings made with the pen or brush on transfer-paper, or impressions from copper, steel, and pewter plates, taken on a coated paper, and then in printing off from the stone the writings or drawings thus made upon it. The principles of the art are these: an unctuous composition having been made to adhere to a calcareo-argillaceous stone, those parts covered by it—i.e., the writing or drawing—acquire the power of receiving printing-ink, whereas those parts not containing the writing or drawing are prevented from receiving ink from the inking-roller by the interposition of water; and lastly, an absorbent paper being laid on the stone, and subjected to strong pressure, copies are obtained.

The best *lithographic stones* are found at Kelheim and Solenhofen, near Pappenheim, on the Danube, in Bavaria; but they have been found also in Silesia, England, France, Canada, and the West Indies. These stones are composed of lime, clay, and siliceous earth, and are of various hues, from a pale yellowish-white to a light buff, reddish, pearl-gray, light-gray, blue, and greenish color. Those of uniform color are the best. The yellow-buff ones, being soft, are adapted for lettering and transfer; the pearl-gray ones, being harder, for chalk-drawings and engraving. They are found in beds, commencing with layers of the thickness of paper, till they reach the dimensions of one and several inches in thickness, when they are easily cut, being yet soft in the quarries, to the sizes required for printing purposes. The stones are ground plane with sand, and, when required for the pen, the brush, the graver, or transfer, they are polished with pumice and water-of-Ayr stone; and for chalk-drawings and graduated tints, an artificial grain is given by ground glass or fine sand.

When any writing or drawing has been finished on stone, it then requires to be etched, thus: a mixture of 2 parts of nitric acid, and from 40 to 60 parts of dissolved gum-arabic, is poured over the stone once or several times, according to the nature of the work. The etching changes the surface of the stone, raising the work on it to a degree scarcely perceptible to the naked eye. The writing or drawing, which has been effected by greasy ink or chalk, remains protected from the action of the acid, and those protected parts retain the natural property of the stone, which is the qualification of receiving printing-ink; and, when the printer wets the stone before applying the inking-roller, the water enters only those parts of the stone which have been affected by the acid, while the ink adheres only to those parts, however fine, on which the acid could not operate, owing to the unctuous composition of the ink or chalk with which the drawing or writing has been done, and which, being greasy, rejects the water. Thus it is called *chemical printing*.

The *chemical ink*, for *writings and drawings in line*, is composed of 2 parts of white wax, 2 shellac, 1 hard soap, ½ tallow, ½ carbonate of soda, and 1 of powdered lamp, or better, Paris black. The chemical chalk (crayon) is made of 3 parts of white wax, 2 hard soap, 1 shellac, ½ "drops of" mastic, 1 tallow, ½ old lard, ½ Venetian turpentine, ½ Brunswick black, ½ carbonate of soda, and 1½ of Paris black, properly melted and burned together.

When the *drawing* or *writing with ink* on a polished stone is completed, the etching is proceeded with, and a portion of the etching composition allowed to dry on the stone. The printer then adjusts his stone in the press, washes off the dried gum, removes the whole drawing or writing with turpentine, wets the stone with a sponge or damping canvas, then applies his roller containing the printing-ink, and rolls it several times over the stone till the lines appear again. When sufficient ink has been applied to the lines, the paper is laid on the stone, drawn through the press, and the impression effected. The damping and inking of the stone are renewed for every impression.

Chalk-drawings are done on the grained stone with the chemical chalk with the stump and scraper, and sharp lines with ink; so that, if boldly and systematically treated, by giving the effect first, and detail afterwards, there will be produced richness and softness of appearance and freedom of manipulation, and a great many impressions will be yielded.

Tinted drawings, *chromo-lithography*, and *colored maps* require as many stones—grained or polished, as the case may be—as there are various tints or colors, one stone being printed after the other, and so fitted and blended together as to produce when complete, the effect desired.

Great Britain is famed for *writings, plans, and drawings*, done with transparent quills, steel-pens, and small camel-hair brushes, *on yellow transfer-paper*, prepared as follows: 1 part best flake-white, 1 isinglass or gelatine, with a little gamboge to give it color, are dissolved in water over a slow fire, then sifted through double muslin and spread *once*,

in a very warm state, with a large, flat camel-hair brush on *one* side of good-sized, smooth, thin paper, which, when dry, requires to be passed frequently, over a heated stone, through the press. The paper being drawn or written upon with lithographic ink is, when finished, put for a few minutes between damp blotting-paper; a warmed stone is put in the press, the sheet is placed with the coated side upon it, and then passed several times through the press; the back of the paper, now adhering to the stone, is then sponged with water; the stone is turned and passed several times again through the press in the opposite direction, after which the sheet is softened with water, and rubbed with the fingers until it can be easily removed from the stone. Some gum is then put upon it, and a linen rag dipped in printing-ink, and with the aid of a little water, passed in all directions over the lines till they appear black and clean. The stone is then allowed to cool, inked up with the roller, then very slightly etched, and after being cleaned is ready for use.

Authography is the name given to a writing or drawing done with the chemical ink on one side of any plain—*not coated*—paper; for example, bankers' circulars: the transfer is done in the same manner as already described, with the difference that the sheet, when laid on the stone, is passed only *once* through the press.

Transferring of any writings, maps, drawings in line or music, done on copper, steel, and pewter-plates, and *retransferring* of any line-work *already on the stone*, form an important part of lithography, as an unlimited number of impressions can be produced *at a very moderate expense without wearing out* the original plates or stones, and as parts of various plates, stones, and letterpress can be transferred to, and printed from, *the same stone*. The best *transfer-paper for this purpose* is the following: mix 3 parts of shoemakers' paste (without alum) with 1 part of best ground plaster of Paris, a little dissolved patent glue, and some tepid water; strain the mixture through double muslin in a common jar, and, when cooled, spread it with a large, flat camel-hair brush over half-sized thickish paper. The *ink* for *taking transfers* is a composition of two table-spoonfuls of printing varnish, 1½ parts of tallow, 3 brown hard soap, 4 brown wax, 5 shellac, 5 black pitch, and 2½ parts of powered lampblack. The various ingredients are melted for 25 minutes, and set fire to the mass for other 15 minutes; afterwards formed in sticks. When the impressions have been made on this coated paper with this transfer-ink, the transfer is accomplished on the stone as already described.

With regard to *engraving* and *etching on stone, photo-lithography*, the *application* of *electrotyping* to *lithography*, the working of the *ruling-machine* for skies and ornaments, the *lithographic steam-press*, etc., we must refer the reader to special works on lithography; and see under PHOTOGRAPHY.

It may not be out of place to mention that in the field of lithography Germany occupies the first place for *careful execution*, France for *rich* and *artistic effect*, Britain for *transferring, tint-printing*, and *chromo-printing*.

Strixner, Hohe, Hanfstängl, Piloty, Loehle, Locillot, Auer, Leon Noel, Mouilleron, Engelmann, Sabatier, Calame, Lasalle, Haghe, Ghémar, Hullmandel, Day, Hanhart, Brooks, Lemercier, may be mentioned, from among many others, who have helped to perfect lithography.

LITHOL'OGY (*lithos*, a stone) is that division of geology which considers the constitution and structure of rocks, apart from their relations in time or position to each other. See GEOLOGY.

LITH'OMARGE, an earthy mineral, sometimes called *mountain marrow* (Ger. *Steinmark*), consisting chiefly of silica and alumina, with oxide of iron and various coloring substances. It is soft, greasy to the touch, and adheres strongly to the tongue. It is generally white, yellow, or red, often exhibiting very beautiful colors. It is found in Germany, Russia, etc., also in the tin-mines of Redruth in Cornwall.

LITHONTRIP'TICS (from the Greek words *lithos*, a stone, and *tribo*, I wear out) is the term which is applied to those remedies which, whether taken by the mouth or injected into the bladder, act as solvents for the stone.

Various medicines have at different times been recommended and employed as solvents for the stone. Rather more than a century ago, limewater and soap, when swallowed in sufficient quantities, had a high reputation as solvents for urinary calculi. These were the only active ingredients in Miss Stephens's *Receipt for the Stone and Gravel*, which was reported on so favorably by a committee of professional men that parliament, in 1739, purchased the secret for £5,000. The treatment doubtless afforded relief; but there is no evidence that any calculus was actually dissolved, for in the bladder of each of the four persons whose cure was certified in the report the stone was found after death. At present no substance which, taken by the mouth, has the power of dissolving calculi is known; but as Dr. Prout remarks in his well-known treatise, *On the Nature and Treatment of Stomach and Urinary Diseases*, remedies of this class are to be sought "among harmless and unirritating compounds the elements of which are so associated as to act at the same time, with respect to calculous ingredients, both as alkalies and acids." Solutions of the supercarbonated alkalies containing a great excess of carbonic acid—as, for example, the natural mineral waters of Vichy—approach most nearly to what is required. The relief which, in many instances, has followed the administration

by the mouth of substances supposed to be lithontriptics has been derived not from the solution of the calculi, but from the diminution of pain and irritation in the bladder.

On the other hand, considerable success has been obtained by the direct injection of solvents into the bladder, especially when the nature of the calculus is suspected; weak alkaline solutions have apparently caused the disappearance of uric-acid calculi, while phosphatic calculi have unquestionably been dissolved by the injection of very weak acid solutions. It is reported that a weak galvanic current has been recently found successful in the hands of an Italian surgeon.

LITHOPHA'GIDÆ (Gr. stone-eaters), a term sometimes applied to the mollusks which bore holes for their own residence in rocks. See PHOLAS.

LITH'OPHANE (Gr. *phanos*, clear, transparent), a peculiar style of ornamental porcelain chiefly adapted to lamps and other transparencies; it consists of pretty pictures produced on thin sheets of white porcelain by stamping the porcelain, whilst still soft, with raised plaster-of-Paris casts of the pictures intended to be produced. By this means an intaglio impression is obtained; and when the sheet of porcelain has been hardened by fire, the impression gives a picture, owing to the transparency of the porcelain, which has the lights and shadows correctly shown, if viewed by transmitted light. Lithophane pictures are common in Germany, where the art has been more favorably received than in France, its native country. They are usually employed to form the sides of ornamental lamps and lanterns, and are sometimes inserted in decorative windows.

LITHOT'OMY (Gr. *lithos*, a stone; *tŏmē*, the act of cutting), the technical name for the surgical operation popularly called *cutting for the stone*.

As most of the symptoms of stone in the bladder (which are noticed in the article CALCULUS) may be simulated by other diseases of the bladder and adjacent parts, it is necessary to have additional evidence regarding the true nature of the case before resorting to so serious an operation as lithotomy. This evidence is afforded by *sounding* the patient—a simple preliminary operation, which consists in introducing into the bladder, through the natural urinary passage (the urethra), a metallic instrument, by means of which the stone can be plainly felt and heard.

Lithotomy has been performed in various ways at different times. The earliest form of lithotomy is known as *cutting on the gripe*, or *Celsus's method*. It received the former name from the stone, after being fixed by the pressure of the fingers in the anus, being directly cut upon and extracted; and the latter, from its having been first described, so far as is now known, by Celsus, although it had probably been practiced from time immemorial. At a later period this operation received from Marianus the name of the *apparatus minor* (from a knife and hook being the only instruments used), to distinguish it from his own method, which he called the *apparatus major*, from the numerous instruments he employed. The *Marian method* was founded on the erroneous idea that wounds of membranous parts would not heal, while their dilatation was comparatively harmless. The object was to do as little as possible with the knife, and as much as possible with dilating instruments; and the necessary result was laceration and such other severe injury, that this became one of the most fatal operations in surgery. Nevertheless, it was the operation mainly in vogue for nearly 200 years, till Frère Jaques, in 1697, introduced what is essentially the method now in use.

The *lateral operation*, so called from the lateral direction in which the incision is made into the neck of the bladder, in order to avoid wounding the rectum, is that which, with various minor modifications, is almost universally employed at the present day. Frère Jaques, a priest, seems to have learned the method from a provincial surgeon named Pierre France, and to have practiced it with much success, and in 1697 he came to Paris in order to make it publicly known. The advantage of this operation, by which a free opening, sufficiently large for the extraction of a stone, can be made into the bladder without laceration of the parts or injury to the rectum, was immediately recognized by the leading surgeons of the time, and the Marian process was at once universally given up.

We can only very briefly indicate the leading steps of the operation. The patient being laid on the table, and chloroform being administered, an instrument termed a curved staff, with a deep groove, is passed into the bladder. An incision is then made on the left side of the mesial line, about an inch and three-quarters in front of the anus, and extending downwards to midway between the anus and the tuberosity of the left ischium. The incision should be sufficiently deep for the operator, on introducing a finger of the left hand, to feel the groove of the staff. The knife, directed by this finger, is now fixed in the groove, and sliding along it towards the bladder, divides the membranous portion of the urethra, the edge of the prostate, and the neck of the bladder. The knife is now withdrawn, as also is the staff, and the surgeon introduces the forceps over the finger of the left hand into the bladder, feels for the stone, and draws it out.

It is unnecessary to enter into any of the details of the after-treatment. At first the urine escapes through the wound, but in favorable cases it is voided by the natural passage in a week, and the wound heals in the course of a month.

From the shortness of the female urethra and the extent to which it can be dilated,

and, additionally, from the comparative rarity of calculous affections in women, the operation of lithotomy is exclusively restricted to the male sex.

The danger of the operation seems to vary with the age of the patient. Out of 186 cases collected by Mr. Hutchinson of the London hospital, 137 were under the age of 20, and of these, 123, or nearly 90 per cent, recovered; while of the 49 who were over 20 years of age, 26, or more than 53 per cent, died.

LITHOT'RITY (Gr. stone-crushing), the surgical operation of breaking up a stone in the bladder into such small fragments that they may readily be expelled by the urethra. Although the importance of such an operation has been recognized from the earliest time, a French surgeon, Civiale, who commenced his researches in 1817, but did not perform his first operation till the beginning of 1824, is entitled to be regarded as the discoverer of lithotrity. The instrument by which the disintegration of the stone is effected is introduced in the same manner as a catheter or sound into the bladder, and, after catching the stone, either bores, hammers, or crushes it to pieces.

Crushing is now generally preferred, the stone being grasped by the blades of the instrument, one blade acting on the other by means of a screw.

The process seems, at first sight, so safe, as compared with the operation of lithotomy, that it is necessary to distinguish those cases in which it may be resorted to and those in which it is contra-indicated. It may be resorted to when the patient is an adult, and the urethra full-sized and healthy, so as freely to admit the passage of the instrument; when the prostate is not much enlarged, which is very often the case in old men, and when the bladder is not thickened or very irritable: while it must be avoided in children, in consequence of the smallness of the urethra; when there is great irritation and thickening of the bladder; when there is great enlargement of the prostate, which hinders the manipulation of the instrument and the escape of the broken fragments of stone; when the stone is of large size, as, for example, of a greater diameter than 2 in.; and when there is reason to believe that the concretion is a mulberry calculus, which, from its extreme hardness, cannot readily be broken. Great care must be taken that no fragment remains in the bladder, as such fragments are almost sure to form the nuclei of fresh calculi.

LITHUA'NIA, a former grand-duchy, holding of the crown of Poland, which, before the partitions of that country, was composed of three groups of territory: 1. Lithuania proper, or Litiva, which formed the governments of Wilna and Troki; 2. The duchy of Samogitia; 3. Russian Lithuania, comprising Polesie, Black Russia or Novogrodek, White Russia or Minsk, Meislav, Witebsk, Smolensk, Polotsk, and Polish Livonia. This country contained about 135,000 English sq.m., and was partitioned between Russia and Prussia, the latter receiving what is now denominated the government of Gumbinnen, in e. Prussia. The Lithuanians, a race to whom belong the Letts of Livonia, the Cours of Courland, and the ancient inhabitants of e. Prussia, are probably a Slavonic people, whose original characteristics have been much modified by time and the intermixture of other races. According to Latham, the Lithuanian language approaches nearer to the Sanskrit than any other member of the Aryan group.

Lithuania was at first subject to Russia, but shook off the yoke about the end of the 12th c. and became an independent power. Their rulers, who bore the title of grand-duke, conquered the neighboring Russian provinces, and even carried their ravages to the very gates of Moscow. The grand-duke of Lithuania, Jagellon, was in 1386 elected king of Poland, and issued an edict of union between the two countries, and in 1569 the two were declared to be one country.

LITIZ, a borough of Lancaster co., Penn., on the Reading and Columbia railroad, 20 m. s.w. of Reading. It has 3 churches; Linden hall, a well-known Moravian school for girls; a bank; a newspaper; and manufactures of beer, flour, coaches, machinery, cigars, etc. The town is an ancient settlement of the Moravians, who are still the chief element in its population and social life.

LITMUS is a well-known coloring matter which is obtained from several lichens, but chiefly from *lecanora tartarea*. The lichens are powdered and digested with ammoniacal fluids (urine, for example) till they undergo decomposition. Alum, potash, and lime are then added, and the mixture is allowed to stand till the maximum degree of color is observed. Sand and chalk are added, to give a due degree of solidity, and the mass is then dried in cubes, and is ready for the market. The exact nature of the changes which ensue is not altogether known; it is, however, certain that the pigment is originally red, and that it only becomes blue on the addition of alkalies or of lime. This blue color is again changed into a red on the addition of a free acid.

The use of litmus-paper and tincture of litmus for the purpose of detecting the acidity of fluids, etc., is known to every student of chemistry. See TEST-PAPERS.

LITTA, POMPEO, Count; 1781–1852; b. Italy; in early life an officer in the French army, and participant in the battles of Ulm, Austerlitz, and Wagram. In the revolutionary epoch of 1848 in Italy he was for a short time secretary of war of the provisional government. His fame, however, rests on the authorship of a superb work on the celebrated families of Italy—*Famiglie celebri d'Italia*—which is commended equally for the fullness and accuracy of its biographies, the beauty of its typography, and the ele-

gance of its style. Its first publication was by subscription in 1819. At the time of his death it embraced the history of 113 families. Others have been added since by Oderici and Passerini.

LITTELL, ELIAKIM; 1797–1870; b. Burlington, N. J.; in 1819 began to publish and edit at Philadelphia the *National Recorder*, afterwards the *Saturday Magazine*. In 1822 he established the *Museum of Foreign Literature*, and in 1844 founded *Littell's Living Age* in Boston, a periodical which is still continued, and greatly valued for its judicious selections from the current periodical literature of Europe. He drew up the Clay compromise tariff of 1833. Died in Brookline, Mass.

LITTLE, GEORGE; 1754–1809; b. Marshfield, Mass.; was commander of the armed vessel, *The Boston*, belonging to Massachusetts at the beginning of the revolutionary war; was first lieut. on *The Protector* in 1779, when it was captured by a British frigate, and he was taken to England as a prisoner; having made his escape, he subsequently took command of the sloop *Winthrop* and cruised successfully till the end of the war; commanded the national frigate *Boston* in 1798; was made capt. of the navy in 1799; retired to his farm in Weymouth in 1801, and lived there until his death. He wrote *The American Cruiser* and *Life on the Ocean*.

LITTLE CHRISTIANS, a new sect formed in 1868 by members of the Russo-Greek church living at Atkarsk in the province of Saratoff, Russia. There were at first but 16 members. They claim that Christ commanded them to form the new church. Before doing it they were immersed, and fasted, and changed their names. They condemned worship of saints and altar-pieces as idolatrous, and abandoned the use of bread and wine in the Lord's supper. Dixon in his *Free Russia* says: "They have no priests, and hardly any form of prayer. They keep no images, use no wafers and make no sacred oil. Instead of the consecrated bread, they bake a cake, which they afterwards worship, as a special gift from God. This cake is like a penny bun in shape and size, but in the minds of these *Little Christians* it possesses a potent virtue and a mystic charm." They gave themselves the name they bear. They have been persecuted by the government, but have increased in numbers.

LITTLEDALE, RICHARD FREDERICK, b. Dublin, 1833; graduated in Trinity college, Dublin, 1854; was ordained in the church of England, 1856; and after a few years of parochial service in London, devoted himself to authorship on ecclesiastical questions, making a special study of liturgies and of the relations between the national church and dissenting bodies. He is author of *Philosophy of Revivals; Offices of the Holy Eastern Church; Catholic Ritual in the Church of England;* and many other works.

LITTLE FALLS, a village of New York, on the Mohawk river, 91 m. n.w. of Albany, on the line of the Erie canal, and New York Central railroad. The Mohawk here passes through a romantic defile of 2 m. in length, with falls of 42 ft., giving water-power to several paper-mills, woolen factories, flouring-mills, etc. The village has numerous churches, a bank, newspapers, and manufactures of starch, shoes, etc. Pop. in '70, 5,387.

LITTLE FALLS (*ante*), a t. and village of Herkimer co., N. Y., on the Mohawk river, the Erie canal, and the New York Central railroad, 73 m. w.n.w. of Albany. Pop. of the town, '80, 6,911. The river here passes through a narrow gorge, and has a fall of more than 40 ft. in three-fourths of a mile, affording abundant water-power. The Erie canal passes by a deep cut 2 m. long in solid rock, presenting a most picturesque appearance, and the feeder crosses the river by an aqueduct with an arch of 70 ft. span. Many of the dwellings in the village stand upon steep declivities, commanding views of attractive scenery. The place contains 8 churches, a bank, 2 newspapers, an academy, and manufactories of cotton, paper, starch, axes, woolens, boots and shoes, etc. It is also the center of a considerable trade in cheese.

LITTLE HUMBOLDT RIVER, in Humboldt co., Nev.; a tributary of the Humboldt river from the n.w., flowing from an elevation of 4,500 ft., through the fertile Paradise valley, where large areas of excellent bench-land and bottom-land are subject to easy irrigation from it. It is about 250 m. by sea n. from San Francisco.

LITTLEJOHN, ABRAM NEWKIRK, D.D., LL.D., b. N. Y., 1824; graduated at Union college in 1845; ordained deacon in the Protestant Episcopal church in 1848; admitted to priest's orders in 1849; was rector of Christ church, Springfield, Mass., in 1850, of St. Paul's church in New Haven 1851–60, and of the Holy Trinity church in Brooklyn 1860–69. He declined the offer of the presidency of Hobart college in 1858, and the appointment as bishop of central New York in 1868. In 1868 Long Island was made a separate diocese, and Dr. Littlejohn was elected its bishop and consecrated in 1869. He was appointed by the presiding bishop in 1874 to take charge of the American Episcopal church in Europe. His contributions to periodicals, especially the *Church Review*, have been numerous. In 1854 he delivered a course of lectures on the *Philosophy of Religion* in Philadelphia. He has published also sermons, charges, and addresses. His diocesan administration has shown high executive ability.

LITTLE KANAWHA RIVER, of western Virginia; a tributary of the Ohio river, emptying at Parkersburg, and having its source in Upshur county. It is in the coal-oil

district, and for the transportation of oil and other commodities, slack-water navigation has been created up the river 38 m. to Burning Springs by means of three dams and locks. It flows through a hilly country well suited to sheep growing, and is bordered by rich bottom-lands. Logs for lumber were formerly the principal product of its region.

LITTLE RIVER, a co. of s.w. Arkansas, bordering upon Texas and the Indian territory, and lying between Little and Red rivers; 500 sq.m.; pop. '80, 6,404, of whom 3,342 are colored. It has a diversified surface and a fertile soil. Cotton, corn, and pork are staple products. Valuation of real and personal property, $1,289,241. Capital, Richmond.

LITTLE ROCK, the capital of Arkansas, is situated on the s. bank of the Arkansas river, 300 m. from its mouth, on the first bed of rocks bounding the alluvial valley of the Mississippi. It contains the state capitol, an arsenal, penitentiary, and the usual number of churches. Founded in 1820. Pop. in '70, 12,380.

LITTLE ROCK (*ante*), capital and chief city of Arkansas; pop. '80, 13,185; so named in antithesis to Big Rock, an elevation on the opposite side of the Arkansas river, nearly 500 ft. in height; that on which the city stands being not more than 40 or 50 ft. above the shore. It is handsomely laid out, with broad streets; the business blocks of brick, and the residences surrounded by ornamental gardens and shade-trees; reached by the Little Rock and Fort Scott, the Memphis and Little Rock, and the St. Louis, Iron Mountain and Southern railroads. The state-house and St. John's college are prominent public buildings; and there are a U. S. arsenal and land-office, state penitentiary, and state institutions for deaf mutes and for the blind. Steamers on the Arkansas river touch at Little Rock, and it is a considerable commercial center. The city is considered remarkably healthful.

LITTLE SISTERS OF THE POOR, a Roman Catholic sisterhood originated by M. Le Pailleur at St. Servan, France, in 1840. Their function is to care for the poor and old. They have several houses in the United States.

LITTLETON, an agricultural and manufacturing t. of Grafton co., N. H., on Ammonoosuc river and the Boston, Concord and Montreal railroad. As it is but 28 m. from Mt. Washington, it is also a summer resort. It is well supplied with hotels, banks, churches, and schools; and has a newspaper, a woolen mill, and several factories, the making of stereoscopic views being a specialty. Pop. 2,446.

LITTLETON, ADAM, D.D., 1627–94; b. at Hales-Owen, Shropshire, Eng.; educated at Christ church, Oxford, where he took a high rank in the classics; was successively rector of Chelsea, chaplain to king Charles II., and in 1674 prebendary of Westminster. He was a distinguished oriental scholar, and made a collection of rare books and manuscripts so large that it brought him to bankruptcy. He wrote much on recondite subjects, and published a number of sermons; but his principal work was the *Dictionary of the Latin, Greek, Hebrew, and English Languages*, of which several editions were published. He was a descendant of sir Thomas Littleton. Died at Chelsea.

LITTLETON, or **LYTTLETON**, Sir THOMAS, a celebrated English jurist, was b. early in the 15th c. (the exact year is not known), studied—it is thought probable—at Cambridge, after which he removed to the inner temple. Henry VI. appointed him steward or judge of the court of the palace, and in 1455 king's sergeant, in which capacity he traveled the northern circuit. In 1466 he was made one of the judges of the court of common pleas; and in 1475 he was created knight of the bath. He died Aug. 23, 1481. Littleton's fame rests on his work on *Tenures*, which was originally written in Norman-French, and first published about the time of his death. It went through a multitude of editions. The first translation into English was made in 1539, and in the course of the next 100 years it went through no loss than 24 editions. The changes in the laws relative to property have greatly diminished its value, and it is now little studied by lawyers; yet it is considered a model from the clear and logical manner in which the subject is handled.

LITTLE TURTLE, d. 1812; an Indian chief of the Miami nation, distinguished for his intelligence, shrewdness, and courage; date of birth unknown. He commanded in the battles which resulted in the defeat of gen. Harmar on the Miami in 1790, and of gen. St. Clair at St. Mary's in 1791; was present, though not in command, at the battle of Maumee Rapids in 1794, when the Indians were defeated by gen. Wayne; was one of the signers of the treaty of Greenville in 1795, which closed the war and secured to the whites large tracts of land in Ohio. In 1797 he visited pres. Washington in Philadelphia, on which occasion he had an interview with Volney, the French philosopher, and received from Kosiusco a pair of pistols, elegantly mounted. Died at Fort Wayne.

LITTLE VALLEY, a t. in Cattaraugus co., N. Y.; pop. '70, 1108; situated on the Erie railroad, and near the Alleghany river. The leading business interest is farming and dairying, though there are also steam mills, stores, and a generally active condition of affairs.

LITTORA'LE, or LITORALE, a province of the Austro-Hungarian monarchy, situated on the n. shores of the Adriatic sea, and including the neighboring islands. It comprises the counties of Görz and Gradisca, the margraviate of Istria, and the district

of Trieste; 3,085 sq.m.; pop. 600,525. In former times the name was applied to two strips of land on the n. shores of the Adriatic, the eastern one of which has figured in Hungarian history. It was once a part of the Croatian military territory, was made a civil district of Hungary by Maria Theresa, formed a part of the French province of Illyria under Napoleon, was recovered by Austria in 1814, reannexed to Hungary in 1823, occupied by Croatia in 1848, and attached to that province by Francis Joseph in 1849. The principal towns of the province are Buccari and Porto Re.

LITTRÉ, MAXIMILIEN PAUL EMILE, a French journalist and philologist, member of the academy, was b. in Paris, Feb. 1, 1801. He distinguished himself in his studies, and obtained various honors at the grand competition. He began the study of medicine, and pursued it so far with distinction; he did not, however, take the degree of doctor, nor enter on practice, but gave himself up to researches in philology, mastering the principal ancient and modern languages, and in the history of medicine. At the same time that Littré took an active part in editing various journals and literary collections, he prepared an edition and translation of the works of Hippocrates (*Œuvres d'Hippocrate*, 1839–61, 10 vols. 8vo), a publication which immediately opened for him the doors of the academy of inscriptions (Feb., 1839).

Littré, who held democratic opinions, and had distinguished himself among the combatants of July, became afterwards connected with the *National*, and was one of the principal editors of it till 1851. When M. Auguste Comte's new philosophical and social doctrine appeared under the name of positive philosophy, Littré, attracted by the scientific character of the doctrine, took it up with great ardor, and in 1845 wrote a lucid and clever summary of it (*De la Philosophie Positive*), and afterwards defended it in pamphlets and in journal articles. He looked upon the revolution of 1848 as the advent of his opinions; but soon undeceived, he retired from active politics in Oct., 1848, resigning even his office of municipal councilor of the city of Paris. He had ere this declined the decoration of the legion of honor. Returning to a life of study Littré continued his researches in medicine, at the same time working ardently at the history of the French language. Already master of the old forms of the French language, he published in the *Revue des Deux Mondes*—to which he has contributed at different times several papers equally ingenious and learned—an article called, The Homeric Poetry and the Ancient French Poetry (*La Poésie Homerique et l'Ancienne Poésie Française*, July 1, 1847), which attracted great attention. In it he attempted the translation of the first book of the *Iliad* in the style of the Trouvères. The academy of inscriptions chose him, in place of Fauriel (1844), to be one of the commission charged with continuing *L'Histoire Littéraire de France* (The Literary History of France), and he is one of the authors of vols. xxi., xxii., xxiii. In 1854 he was appointed editor of the *Journal des Savants*, and he has since contributed many articles to that collection. Littré's principal work is his *Dictionnaire de la Langue Française*, containing, in addition to the usual information in French dictionaries, examples of the several meanings of the words, with exact reference to the classical works from which they are taken, besides the history of the usage of each word in documents anterior to the 17th century. Not only are all questions of grammar and lexicography (including etymology—a subject in which French dictionaries have hitherto been singularly deficient) fully discussed, but historical allusions are explained, and numerous details given regarding the arts and sciences, rendering the work a kind of cyclopædia. In preparation for many years, it began to appear in 1863, and was completed in 1873. This splendid work, which is the real *thesaurus* of the French language, so long a desideratum, did not prevent the French academy in 1863 from rejecting the author, whom M. Dupanloup denounced publicly as holding immoral and impious doctrines. Littré has also published an excellent French translation of Strauss's *Life of Jesus* (1839–40, 2d ed. 1855); and a translation of Pliny's *Natural History*. In 1832 he published a paper on cholera. As editor or *collaborateur*, Littré was connected with the *Dictionnaire de Médecine*, the *Gazette Medicale de Paris*, and the surgical journal called *L'Expérience*. We may also notice from his pen—*Histoire de la Langue Française* (1862, 2 vols. 8vo); *Paroles de Philosophie Positive* (1859); *Auguste Comte et la Philosophie Positive* (1863); and *Auguste Comte et Stuart Mill* (1866). He published in 1857 the *Œuvres Complètes d'Armand Carrel*. In 1870 he contributed to the *Revue Positiviste* an article *Des Origines organiques de la Morale*, which attracted great notice, and furnished with new argument the Catholic theologians, who accused him of atheism. Three months before, Littré had opposed the publication of M. Comte's later works as being unworthy of him. Just before the siege of Paris, Littré's friends compelled him to quit the capital. In Jan., 1871, M. Gambetta appointed Littré professor of history and geography at the ecole polytechnique. Next month he was chosen representative of the Seine department in the national assembly, where he sat with the party of the left. At its sitting of Dec. 30, 1871, the French academy at last admitted him to membership, choosing him to fill the place of M. Villemain. On this occasion, M. Dupanloup, bishop of Orleans, thought fit to resign his connection with the academy. In 1875 he was made a doctor of literature by Leyden university, and member of the Austrian academy. *Médecine et Médecins* was published by Littré in 1872.

LIT'TROW, JOSEPH JOHANN VON, 1781–1840; b. Bohemia. First a professor of astronomy at Cracow; afterwards at the university of Kazan, in the city of the same

name, 430 m. e. of Moscow. In the later years of his life he became professor of astronomy in the university of Vienna, and director of the observatory, in the management of which he became eminent. His lectures were extremely popular. His published works are: *Die Wunder des Himmels*, which has passed through several editions; *Theoretische und practische Astronomie;* and *Atlas des gestimten Himmels.* Died in Vienna.

LIT'URGY (Gr. *leitourgia*, a public service), in general, signifies a form of prayer and ceremonial established by ecclesiastical authority, to be used in the public services of the church, but is especially applied to that used in the celebration and administration of the eucharist. The very earliest historical records of Christianity plainly show that such forms were in use in the primitive times, but it seems highly probable that for a considerable period they were not reduced to writing; and hence even those of the extant liturgies which represent the earliest forms differ considerably from each other, if not in the substance of the rite, at least in the arrangement even of those parts which are common to them all. A theological discussion of the subject of the liturgy, though, of course, most important in a doctrinal point of view, and most interesting for the study of Christian antiquities, would be out of place in a popular cyclopædia. The liturgies form the great stronghold of the Catholic controversialists on the subject of the real presence and of the eucharistic sacrifice; but we must confine ourselves to a brief historical account of the various liturgies now extant, and of their connection with the various ancient Christian communities, whether of the east or of the west. Liturgies may, indeed, best be distributed into two classes, those of the east, and those of the west.

1. *Oriental Liturgies.*—The oriental liturgies are six in number, four of which are derived from the great churches in which they were used; the fifth from the Armenian church, which early formed a distinct liturgy; and the sixth from the great Syrian sect of Nestorius, by which the liturgy was modified to suit its own peculiar tenets. These liturgies are severally known as the liturgies of Jerusalem, of Antioch, of Alexandria, and of Constantinople, the Armenian liturgy, and the Nestorian liturgy. The diversities of these liturgies, although very great in appearance, yet can hardly be said to be substantial. Certain leading parts are common to them all, and are found in all without substantial variation; but they are arranged in a different order, and, except in the form of the eucharistic consecration, the hymn Trisagion, and a few other details, the form of words is often entirely dissimilar. The liturgy of Jerusalem, although ascribed to St. James, is of uncertain origin and date; nor is it well ascertained whether its original language was Syriac or Greek. The latter is the language in which it is now found, and the present liturgy closely corresponds in the main with that which formed the text of St. Cyril of Jerusalem in his well-known mystagogical lectures. The liturgy of Antioch exists in Syriac, but it is evidently only a free translation of the liturgy of Jerusalem. The ancient liturgy of Alexandria is ascribed to St. Mark; but the existing liturgy has received numberless additions at later dates, and has been modified by both the great sects of this patriarchate to suit their peculiar doctrines. Several other liturgies are in use among the Copts, under the name of St. Basil, St. Gregory, and St. Cyril; and the Abyssinian Christians have no fewer than ten, which are distinct, at least in name. The church of Constantinople has two different liturgies, both of great antiquity, that of St. Basil and that of St. Chrysostom. These, however, are not indiscriminately used, each being employed on special occasions or on certain defined festivals. The liturgy of Constantinople is the original of the Slavonic liturgy, which is used in the Russian and Russo-Greek church, and in its various branches. The Armenian liturgy dates from the introduction of Christianity into Armenia under Gregory the illuminator. It is in most respects derived from that of St. Chrysostom. The Nestorians have three liturgies—the liturgy of the apostles, the liturgy of Theodore of Mopsuestia, and the liturgy of Nestorius. These, however, are all combined into one, each being assigned to a particular season, or used on special occasions. The language of all is Syriac.

2. *Western Liturgies.*—The liturgies of the west present much less variety, and indeed are all derived either from the eastern liturgies or from a common source. The Catholic liturgies may be reduced to four—the Roman, the Milanese or Ambrosian, the Gothic or Mozarabic, and the Gallic liturgies. The oldest forms of the Roman liturgy are to be found in three so-called sacramentaries—that of Leo, that of Gelasius, and that of Gregory the great. It is the last that has left its impress most clearly on the modern Roman missal, which was brought to its present shape by a commission ordered by the council of Trent, after a careful revision and collation of all the liturgical forms in use in the west in the 16th century. The first revision took place under Pius V., and two subsequent revisions were made by Urban VIII. and Clement VIII. The Ambrosian liturgy is used only in the diocese of Milan, and is popularly traced to St. Ambrose. It bears a close analogy to the Roman liturgy, but it has many peculiarities, some of which are highly interesting, as illustrating the history of the details of Christian worship. Its ceremonial, which is observed with great solemnity in the cathedral of Milan, is in some parts highly striking and characteristic. The Gothic or Mozarabic is of still more limited use, being now confined to a single chapel at Toledo, founded and endowed for the purpose by the celebrated cardinal Ximenes. It is the old liturgy of the Gothic

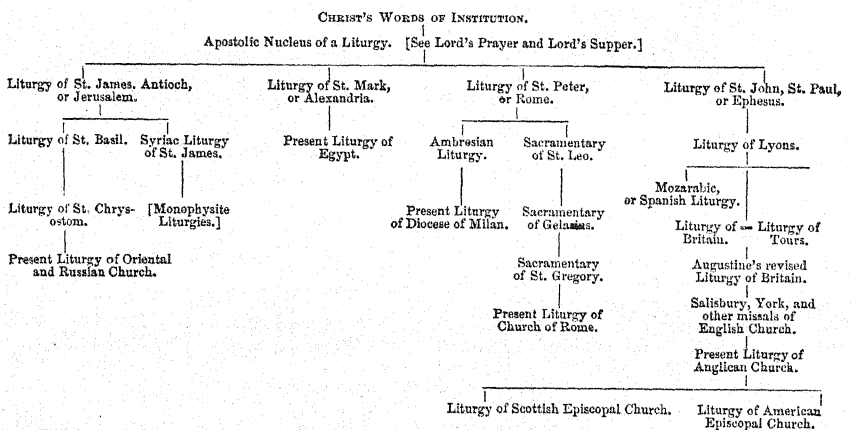
church of Spain; and after the infusion of the Arabic element, which followed the Moorish invasion, it was called by the name of Mozarabic, a word of disputed etymology. This liturgy is certainly of oriental origin; but its history, and the time and circumstances of its introduction into Spain, have furnished matter for much speculation. Some parts of the rite are exceedingly curious, especially those which accompany the breaking of the host. The Gallican liturgy has no precise modern representative, and is only known from ancient forms, more or less complete, which have been edited by Mabillon, and recently by Mone. The older Gallican forms bespeak an oriental origin, and are probably derived from the Greek Christian colony which settled at Marseilles, Lyons, and the other churches of the south. The later forms approximate more to the Roman. Neither of these, however, is to be confounded with the more modern missals in use in several of the French dioceses, which do not differ from the Roman except in minor details, and most of which have now been displaced by the Roman missal. Of Protestant communities, the Anglican church alone professes to follow the ancient liturgical forms (see COMMON PRAYER, BOOK OF). See Renaudot's *Orientalium Liturgiarum Collectio*, 1740, 2 vols.; Assemanni's *Bibliotheca Orientalis;* Palmer's *Antiquities of the English Liturgy;* Binterim's *Denkwürdigkeiten der Christ-Katholischen Kirche.*

LITURGY, JEWISH, in the narrower sense of a ritual of fixed prayers, chiefly for public worship. The Mosaic records contain an ordinance respecting the "confession of sins" (Lev. v. 5; xvi. 21), without, however, prescribing a distinct form for the purpose. Three formulas only are fixed—the benediction of the priests (Num. vi. 24–26), the prayer of thanksgiving on the occasion of the first offering (Deut. xxvi. 5–10), and that which was to accompany the offering up of the third year's tithe, beginning: "I have brought away the hallowed things out of my house" (ib. 13–15). Although prayers are often mentioned before the exile, yet they do not seem, except in the cases mentioned, to have been introduced as yet as a regular element into the service of the temple. The songs of the Levites (1 Chr. xvi. 4; xxiii. 3), and occasional prayers, such as are to be found in the Psalms, or like that of Solomon at the inauguration of the temple, are all we find recorded. Private devotions were common (cf. 1 Kings, viii. 30, etc.; Is. i. 15), but every one prayed when his heart prompted him in the words inspired by his joy or sorrow. Not before the time of Daniel is a fixed institution of three daily prayers mentioned (Dan. vi. 11). The task of compiling a liturgy proper, and of fixing the times and seasons of prayer, was probably first undertaken by the men of the great synagogue. Two chief groups around which, as time wore on, an enormous mass of liturgical poetry has clustered, are distinctly discernible—the one, the *Shemah* ("Hear, Israel," etc.), being a collection of the three biblical pieces (Deut. vi. 4–9; xi. 13–21; Num. xv. 37–41), expressive of the unity of God and the memory of his government over Israel, strung together without any extraneous addition; the second, the *Tefillah*, or prayer, by way of eminence (adopted into Islam as *Salavat*, Sur. ii. 40; cf. v. 15), consisting of a certain number of supplications with a hymnal introduction and conclusion, and followed by the priestly blessing. The single portions of this prayer gradually increased to 18, and the prayer itself received the name *Shemonah Esre* (eighteen). The first additions to the *Shemah* formed the introductory thanksgiving for the renewed day, in accordance with the ordinance that every supplication must be preceded by a prayer of thanks, called *Jozer* (Creator of light, etc), to which were joined *the three holies* (*Ofan*), and the supplication for spiritual enlightening in the divine law (*Ahaba*). Between the Shemah and the Tefillah was inserted the *Geulah* (liberation), or praise for the miraculous deliverance from Egypt and the constant watchings of Providence. A *Kaddish* (sanctification), and certain psalms, seem to have concluded the service of that period. This was the order of the *Shaharith*, or morning prayer; and very similar to this was the *Maarib*, or evening prayer; while in the *Minha*, or afternoon prayer, the Shemah was omitted. On new moons, Sabbath and feast days, the general order was the same as on week days; but since the festive joy was to overrule all individual sorrow and supplication, the intermediate portion of the Tefillah was changed according to the special significance and the memories of the day of the solemnity, and additional prayers were introduced for these extraordinary occasions, corresponding to the additional sacrifice in the temple, and varying according to the special solemnity of the day (*Mussaf, Nëilah*, etc.). The first compilation of a liturgy is recorded of Amram Gaon (870–80 A.D.); the first that has survived is that of Saadja Gaon (d. 942 A.D.). These early collections of prayers generally contained also compositions from the hand of the compiler, and minor additions, such as ethical tracts, almanacs, etc., and were called *Siddurim* (orders, rituals), embracing the whole calendar year, week-days and new moons, fasts and festivals. Later, the term was restricted to the week-day ritual, that for the festivals being called *Machsor* (cycle). Besides these, we find the *Selichoth*, or penitential prayers; *Kinoth*, or elegies; *Hoshanahs*, or hosannahs (for the seventh day of the feast of tabernacles); and *Bakashoth*, or special supplications, chiefly for private devotion.

The public prayers were for a long time only said by the public reader (*Chasan, Sheliach Zibbur*), the people joining in silent responses and amens. These readers by degrees—chiefly from the 10th c.—introduced occasional prayers (*Piutim*) of their own,

over and above those used of yore. The materials were taken from Halacha (q.v.) as well as from Haggada (q.v.); religious doctrine, history, saga, angelology, and mysticism, interspersed with biblical verses, are thus found put together like a mosaic of the most original and fantastic, often grand and brilliant, and often obscure and feeble kind; and the pure Hebrew in many cases made room for a corrupt Chaldee. We can only point out here the two chief groups of religious poetry—viz., the Arabic on the one, and the French-German school on the other hand. The most eminent representative of the Pajtanic age (ending c. 1100) is Eleazer Biribi Kalir. Among the most celebrated poets in his manner are Meshulam b. Kalonymos of Lucca, Solomon b. Jehuda of Babylon, R. Gerson, Elia b. Menahem of Mans, Benjamin b. Serach, Jacob Zom Elem, Eliezer b. Samuel, Kalonymos b. Moses, Solomon Isaaki. Of exclusively Spanish poets of this period the most brilliant are—Jehuda Halevi, Solomon ben Gabirol, Josef ibn Abitur, Isaac ibn Giat, Abraham ibn Esra, Mose b. Nachman, etc. When, however, in the beginning of the 13th c., secret doctrine and philosophy, casuistry and dialectics, became the paramount study, the cultivation of the Piut became neglected, and but few, and for the most part insignificant, are the writers of liturgical pieces from this time downwards.

According to the different countries, the order and even the contents of the cycle differed, since not all liturgical pieces had been incorporated uniformly. We have thus—to name a few out of many—the rituals of Germany (Poland), of France, Spain, and Portugal (Sefardim), Italy (Rome), the Levant (Romagna), and even of some special towns like Avignon, Carpentras, Montpellier. The rituals of Barbary (Algiers, Tripoli, Oran, Morocco, etc.) are of Spanish origin. The Judæo-Chinese liturgy, it may be observed by the way, consists only of pieces from the Bible. The Jewish liturgy has, in its various forms, very frequently been commented upon, and has been translated into nearly every modern language.



We may add, in conclusion, that liturgy forms at this moment the center of a great contest within the pale of Judaism. The "reformers" of more or less advanced tendencies are intent upon shortening the prayers, and principally upon abrogating the greater part of the Piut, as an artificial excrescence hurtful to true devotion.

LITURGY (*ante*). I. In the modern church of Rome several books are in use, some of them by the members generally, others restricted to particular ranks and orders. 1. *The Breviary* contains the daily service of the church of Rome, consisting of the matins and lauds, with variations for different days and canonical hours. It may be employed in all places, but on the model of it other books have been formed for the special use of the Benedictine, Carthusian, Dominican, Franciscan, Jesuit, and other orders. At first it contained only the Lord's prayer and portions of the Psalms, to which Scripture lessons were afterwards added. In ages called, according to the point of view from which judgment is formed, ages of superstition or ages of faith, legendary lives of the saints were inserted, which led to a frequent revision and correction of the breviary, particularly by the councils of Trent and Cologne, by popes Gregory IX., Nicolas III., Pius V., Clement VIII., and Urban VIII., and cardinal Quignon, by whom it was brought nearer to the simplicity of primitive times. At present it consists of services for seven hours, to correspond with David's declaration, "Seven times a day do I praise thee." The obligation to read this book every day, at first imposed on all, was gradually restricted to the beneficiary clergy, who, if they neglect the duty, incur the guilt of mortal sin, and forfeit a part of their revenues proportioned to their delinquencies. It is recited in Latin in Roman Catholic churches everywhere, except among the Syrian Maronites, the Armenians, and other oriental churches who, submitting to the pope's jurisdiction in other respects, are allowed to use the service in their own language (see EASTERN, OR ORIENTAL RITE). 2. *The Missal*, used in celebrating the mass and ascribed by Roman Catholic tradition to the apostle Peter. The canon of the mass, first reduced to writing in the 5th c., was afterwards enlarged, especially by Gregory the great. It is in general use throughout the Roman Catholic church. 3. *The Ceremoniale*, having special reference to the pope, is divided into three books, the first of which treats of the election, consecration, benediction, and coronation of the pope; the canonization of saints, creation of cardinals, the form and mode of holding a council; various public ceremonies to be performed by the pope as a sovereign prince; and funeral solemnities for cardinals and popes: the second book contains the divine offices which the pope celebrates, and the days devoted to them: the third prescribes the reverence due to popes, cardinals, bishops, and other persons intrusted with sacred duties; the order in which they are to be seated in the papal chapel; the sacred vestments and ornaments of popes and cardinals; and the offering of incense at the altar. 4. *The Pontificale* describes the functions of Roman Catholic bishops: the conferring of ecclesiastical orders; benedictions on abbots, abbesses, and nuns; coronation of sovereigns; consecration of churches, cemeteries, and sacred vessels; the expulsion and reconcilement of penitents; the holding of synods; suspending, reconciling, dispensing, deposing, and degrading priests, and restoring them to orders; excommunication and absolution. 5. *The Rituale*, named also the Pastorale, treats of the functions of priests or inferior clergy in their public services and private pastoral duties.

II. At the reformation the existing liturgies were modified in doctrine and translated

into the common languages of the people for use in the reformed churches. 1. Among these reformed liturgies those of Luther led the way. Different offices were prepared by him between the years 1523 and 1534. These were afterwards collected into a volume. In his "Order of Service" provision was made for morning and evening service; consisting of reading the Scriptures, preaching or expounding, with psalms and responses, and mass or communion for Sundays. Other leaders, also, in Lutheran churches, drew up liturgies for themselves. These were afterwards changed as circumstances required. No one form has been made obligatory in all Lutheran churches, yet there is substantial unity of life and spirit in them all. The rationalists of the last century neglected and mutilated the old liturgies, and strove to introduce others in place of them. But with the return to orthodoxy a salutary reaction followed, which has been shown in the study and use of the old forms and in the construction of the union liturgy, first published in 1822 under the auspices of the king of Prussia, and twice revised since then. The object of this last book is to unite the worship of the Lutheran and reformed churches in the Prussian dominions. 2. The liturgy of the renewed Moravian church is chiefly the work of count Zinzendorf, who compiled it from the services of the Greek, Latin, and reformed churches. It consists of a church litany for the usual Sunday morning service; a litany for the morning of Easter-Sunday, containing a brief confession of faith; offices for the baptism of adults and of children; litanies for funerals; offices for confirmation, the communion, and ordination; the Te Deum and various doxologies. There is also a choral with musical responses, a prayer of betrothal, a form used in the church-yards on Easter for expressing the hope of the resurrection concerning the brethren departed during the preceding year. The daily service, held in the evening, is a simple prayer meeting in which, as in the Sunday service, the prayers and exhortations are extemporaneous. 3. In the liturgy of Calvin the service began with a general confession, followed with a psalm, a second prayer, the sermon, prayer, the apostle's creed, and the benediction. There was also a long prayer for times of war and of other troubles. In the administration of the Lord's supper there was an introductory prayer, followed with a practical exhortation, the distribution of the elements, psalms, appropriate passages of Scripture, and the closing prayer. There were also simple, but long offices for baptism and marriage. The present liturgy of Geneva has been taken from Calvin's, with some modifications. It contains no responses, but has several additional prayers. It provides a service for each day of the week, for the principal festivals, and several special occasions. The Calvinistic churches of Holland, Neufchatel, and France have liturgies similar to that of Geneva. That of the church of Scotland was drawn up at Frankfort by John Knox and others on Calvin's model, and was first used by Knox in the congregation of English exiles at Geneva. Introduced by him into Scotland, its use was enjoined in 1564, and was continued after his death. Having a general order like Calvin's, it also gave a clearer discretion to the minister to use prayers of his own composition, either extemporaneous or written. It contained various offices and alternate forms. A new book, somewhat modified, was provided in 1644. In the directory of the Westminster assembly, the discretionary power allowed to the minister is greatly enlarged. The Lord's prayer is recommended as the most perfect form of devotion. Private and lay baptisms are forbidden. The communicants are to sit, instead of kneeling, at the Lord's table.

TABLE OF THE DESCENT OF THE PRINCIPAL LITURGIES NOW IN USE.

LIU-KIU, or **Liu-Tchiu**. See Loo-Choo, *ante*.

LIUTPRAND, or **Luitprand**, an author to whom we owe much of our knowledge of the history of the 10th c., was b. in Italy about the year 922. He was educated at the court of king Hugo, and entered into the service of his successor, Berengarius; but fall-

ing into disgrace at court about 955, resided for some years at Frankfort-on-the Main, followed the emperor Otto I. to Italy in 961, and was made bishop of Cremona, and afterwards sent on an embassy to Constantinople. He died about 970. His *Antapodosis* treats of the period from 886 to 948. He wrote also *De Rebus Gestis Ottonis Magni Imperatoris*, and *De Legatione Constantinopolitanâ*. The best edition of his works is in the *Monumenta Germaniæ* (1839, separately published in 1877). See Köpke, *De Vita Liutprandi* (1842).

LIVADI'A (ancient *Lebadeia*), a t. of Greece, about 60 m. n.w. of Athens. Pop. 5,000. From this place the northern part of the present kingdom of Greece used in Turkish times to be called Livadia.

LIVADI'A, an estate and palace-villa on the s. coast of the Crimea which belongs to the empress of Russia, and is the favorite summer residence of the imperial family. Livadia, which stands near the site of an old town so called, is charming by reason of its climate, its picturesque situation, and the magnificent parks and gardens which surround it.

LIVE OAK. See OAK, *ante*.

LIVE OAK, a s. co. of Texas, intersected by the Rio Nueces; 1200 sq.m.; pop. in '70, 852, of whom 28 were colored. The soil for the most part is best adapted to stock-raising, but there is considerable tillable land in the valleys. Rains in summer are infrequent. In 1870 there were in the county over 5,000 horses, more than 600 milch cows, 62,177 other cattle, 5,024 sheep, and 681 swine. Capital, Oakville.

LIVER, THE, is the largest gland in the body; it weighs from 3 to 4 lbs., and measures about 12 in. from side to side, and 6 or 7 in. from its anterior to its posterior border. It is situated in the right hypochondriac region, and reaches over to the left; being thick and indented behind, where it crosses the convex bodies of the vertebræ; convex on its upper surface, where it lies in the concavity of the diaphragm; and concave below, where it rests against the stomach, colon, and right kidney. This lower surface presents a fissure dividing the organ into a right and a left lobe.

The liver is retained in its position by five ligaments. Besides the right and left lobe, there are three smaller lobes. The great bulk of the organ is, however, made up of the right lobe, which is six times as large as the left.

The vessels of the liver are the hepatic artery, which comes off from the cœliac axis (q.v.), and supplies the organ with nutrient blood; the portal vein, which conveys to the liver the venous blood of the intestines, spleen, and stomach, and from which (after the vessel has ramified like an artery) the bile is secreted;* the hepatic veins, which convey the blood from the liver into the inferior vena cava; the hepatic duct, which carries off the bile from the liver; and the lymphatics.

The liver, both on its surface and internally, is of a dark reddish tint, which is so well known that the term *liver-colored* is universally recognized. The substance of the organ is composed of lobules held together by extremely fine areolar tissue, and ramifications of the minute branches of the various hepatic vessels. Each lobule is composed of a mass of hepatic cells, of a plexus of biliary ducts, of a portal plexus (from the contents of which the cells obtain the biliary matters that are found in their interior), of a branch of the hepatic vein, and of minute arteries. The exact mode in which the bile formed in the cells makes its way into the origin of the ducts, is not known with certainty. The numberless minute ducts gradually run into one another, until, as they emerge from the lower surface of the liver, they are reduced to two large trunks, which soon unite to form the hepatic duct. Into the hepatic duct, the cystic duct from the neck of the gall-bladder (presently to be described) enters, and the two combine to form the common duct (*ductus communis choledochus*), which opens into the duodenum (see DIGESTION). This common excretory duct of the liver and gall-bladder is about 3 in. in length, and of the diameter of a goose-quill.

The chemical composition of the liver has been studied by Dr. Beale, who finds that the organ in health contains 68.6 per cent of water, and 31.4 per cent of solid constituents—of which 3.8 are fat, 4.7 albumen, while the rest is made up of vessels, salts, and extractive matters. (In the diseased condition known as fatty degeneration of the liver —which, by the way, is artificially induced in the geese which contribute to the formation of Strasburg pie, or *pâté de fois gras*—the fat is enormously increased; in one remarkable case analyzed by Dr. Beale, it amounted to 65.2 per cent of the whole weight of the organ.) Sugar, varying in amount from 1 to 2 per cent, is also found; and inosite, uric acid, sarcine, xanthine, and leucine usually occur in traces.

The gall-bladder may be regarded as a *diverticulum* or offshoot from the hepatic duct. It has somewhat the shape of a pear, and lies in a depression on the under surface of the liver. Its use seems to be to serve as a reservoir for the accumulation of the bile, when its flow into the intestine is interrupted, as it is always found full after a long fast, and empty when digestion is going on. That the gall-bladder is not an essential appendix to the liver, is shown by the fact that it is absent in many genera of mammals. Thus,

* Recent investigations throw doubt on this view, and there are reasons for believing that the bile is secreted from the capillaries of the hepatic artery, while the portal blood contributes the material from which the liver-sugar or glycogen is formed or secreted.

it is present in the ox, sheep, and goat, but absent in the horse and many other herbivora.

It was formerly believed that the liver served merely for the separation of the biliary secretion from the blood; but there is now abundant evidence that the blood itself is changed by its means, in such a way as to show that this gland possesses an *assimilating* as well as a *depurating* action. Thus, the albuminous matter contained during digestion in the blood of the veins which pass from the intestine to the portal vein (the mesenteric veins), is very different from the albuminous matter contained in the hepatic veins; the blood, before reaching the liver, containing a crude albuminous product, while the hepatic veins contain only true blood-albumen. That the liver possesses an assimilating power on albuminous substances is also shown by the experiments of Claude Bernard, who found that, if a solution of egg-albumen be injected into any part of the systemic circulation, albumen speedily appears (like other soluble substances which are foreign to the body) in the urine, and is eliminated as an extraneous matter; but if it be injected into the portal vein, it does not appear in the urine, but becomes a normal constituent of the blood (blood-albumen), through the agency of the liver. It is now also known that if the liver does not secrete a true sugar, as Bernard supposed, it at all events secretes a substance closely allied to, and readily convertible into sugar—viz., glycogen (q.v.)—which must be regarded as a respiratory or heat-forming food. Further, it appears from Bernard's researches that fatty matters are elaborated in the liver—the blood of the hepatic veins which leave the liver containing considerably more fat than that of the portal vein which enters it. Some of this fat is doubtless burned off in the lungs; but if a deficient supply should be introduced by the lacteals, some of it would doubtless be applied to the formative processes. Lastly, during the last three days of incubation of the chick, the liver is made bright-yellow by the absorption of the yelk, which enters the branches of the portal vein, and is then converted partly into *blood-corpuscles*, which enter the circulation, and partly into bile, which is discharged into the intestine. Hence, there is distinct evidence, from several points of view, that the liver is an *assimilating* organ. The *depurating* action of this organ is exhibited in the secretion of bile (q.v.), by which the hydro-carbonaceous portion of the effete matters of the blood is removed, just as the nitrogenous portion is eliminated by the kidneys. The use of the bile in the digestive process is sufficiently explained in the article DIGESTION.

Our limited space does not allow of our noticing at any length the comparative anatomy of this important gland, which first shows itself in the form of yellowish-brown cells in the polypes, and gradually becomes more concentrated and developed in the echinoderms, annelides, nudobranchiate gasteropods, insects, crustaceans, air-breathing mollusks, cephalopods, fishes, reptiles, birds, and mammals. Till we arrive at the vertebrated classes, it consists of tubes or follicles containing cells, which stand to them in the relation of an epithelium, and its structure is easily made out; but when, as in the vertebrata, it is mainly composed of a solid parenchyma, made up of lobules, each of which is composed of aggregations of cells surrounded by the alternate ramifications of the ducts and other vessels, it presents an anatomical complexity which it is almost impossible to unravel.

LIVER (*ante*). The physiological anatomy of the liver may be briefly stated as follows: The lobules mentioned in the preceding article are about $\frac{1}{25}$ of an in. in diameter and of an ovoid shape. They are surrounded by a plexus of blood-vessels, nerves, and ramifications of the hepatic duct, comprising what are called the interlobular vessels. These are all inclosed by a sheath which is a prolongation of the proper coat of the liver (capsule of Glisson), but attached loosely by areolar tissue. This sheath follows the vessels to the subdivisions within the interlobular spaces (spaces between the lobules), but does not extend to the capillary vessels *within* the lobules. In a few animals, as the pig and polar bear, the lobular structure can be seen with the naked eye, but in man and most mammals it cannot. The lobules are intimately connected with each other, branches of the interlobular vessels being each distributed to several of the lobules. Any one lobule, however, may be considered as representing the physiological anatomy of the whole liver, and the study of its anatomy and functions will answer for the study of the whole gland. The lobules receive blood at their surfaces from the capillary terminations of the portal vein, these vessels having received the terminations of the hepatic artery before passing into the lobules. It is very important to bear in mind this peculiarity of distribution, which is often overlooked. The branches of the hepatic vein, the vessel which carries the blood from the liver to the ascending great vein (ascending vena cava), by which it is returned to the heart and lungs, have their origin *within* the lobules. Their capillary extremities arise from the capillary ramifications of the portal vein, and, passing toward the center of the lobule, converge into three or four radicles, which, uniting at the center, form the *intralobular* veins, which is the commencement of the hepatic vein. These intralobular veins, which are in the center of each lobule, are from $\frac{1}{1000}$ to $\frac{1}{400}$ of an in. in diameter, and they follow the long axis of the lobule, receiving vessels in their course till they empty into larger vessels situated at the base of the lobules. These latter vessels have been called by Kiernan sub-lobular veins. They collect the blood from all parts of the liver, and, increasing in size by union with one another, they at last form the three hepatic veins which discharge the

blood from the liver into the ascending vena cava. Now, these hepatic veins are a long way from the influence of the heart's action, lying as they do between the portal circulation and the veins going to the heart; but a provision has been made to assist in the propulsion of their contents, and they are supplied with a muscular coat, composed of unstriated muscular fibers. The minute anatomy of the liver has only recently been satisfactorily investigated, and it is to the labors of Beale, E. Wagner, Garlach, Budge, Andréjevic, Koelliker, MacGillavry, Frey, Eberth, Hering, and others that we owe nearly all the knowledge we have upon the subject. The most essential elements of the lobule, or of the liver, remain to be described. They are the hepatic cells, which are the true secreting elements of the gland. They are minute, polygonal-shaped bodies about $\frac{1}{1000}$ of an in. in their longest and $\frac{1}{1500}$ in their shortest diameter, having one nucleus, or sometimes two nuclei, with some granular matter. See CELLS. It has generally been supposed that these hepatic cells were held within a net-work of the capillaries of the portal and hepatic veins, but, according to the investigations of the above named microscopists, this is not the case. They are surrounded by an independent net-work of extremely minute vessels $\frac{1}{10000}$ of an in. in diameter, of uniform size throughout, called the biliary capillaries, and in which the bile first makes its appearance.

We must pause here to refer to the fact that the liver is an organ which has no analogue in any of the other organs of the body. It has two distinct functions, and a cellular arrangement entirely unlike that seen in any other gland. It is excretory on one hand and secreting on another, and it is its secreting function which has been so long overlooked, and the knowledge of which has also thrown so much light on the physiology of what are called ductless glands, like the spleen (q.v.) and the lymphatic glands. The liver, in one of its functions, is a ductless gland. It secretes (that is, not merely separates, but forms) a substance which is not carried away by any excretory vessel, but which is immediately returned to the blood, when it is washed away as soon as formed. The other function of the liver is the production of bile, which, although a true excretion, answers a salutary purpose in the economy. Let us now return to the consideration of the hepatic cells and the lately discovered net-work of vessels which surrounds them, called the biliary capillaries. It is with the utmost difficulty that they have been made out, and it is owing to this that so many hypotheses have been formed in regard to the histology and physiology of the liver, only to be successively abandoned. The meshes which are formed by the passing round the hepatic cells of these minute capillaries are arranged in a cubical manner, very much as if they had been woven around them. The question has been whether these biliary capillaries possessed independent walls or whether they were simply lacunar passages; but the manner in which they have been found to interlace with the blood capillaries decides the question in favor of considering them as vessels having walls, although their caliber is only $\frac{1}{10000}$ of an in., which would require the membrane which forms the tube to be inconceivably thin, and perhaps destitute of any cellular structure, as is generally found in lining membranes of most organs. The precise relations of the hepatic cells and the biliary ducts have been more particularly determined by the investigations of Eberth and Hering; and they find that they vary in different classes of vertebrata, being simpler the farther we descend in the scale of being. In amphibia, for instance, the lobular form is altered, and the bile duct passes through a tubular arrangement of hepatic cells. In reptiles the arrangement approaches more towards that of mammals, but is still far behind in development; and it is only when ascending to birds that a structure is reached capable of performing the excrementitious functions of active, warm-blooded animals. The biliary and blood capillaries never come into actual contact, but are always separated from each other by a distance somewhat less than the diameter of an hepatic cell, or about $\frac{1}{2500}$ of an inch. The biliary capillaries are undoubtedly the commencement of the finer hepatic ducts. In some diseases they become so distended with bile as to become easily discernible with a good microscope. The livers of animals dying of Texan-cattle disease were examined by the late Dr. R. C. Stiles a few years ago, and the observations of the German anatomists were completely verified. The finest bile ducts and capillaries in the livers of these animals were found filled with bright yellow bile, and their relations to the liver cells were easily distinguishable. Favoring the view that they are lined by an excessively thin membrane, Dr. Stiles found in his examinations what appeared to be detached fragments of these capillaries. Between the lobules the bile ducts are still very minute, the smallest being only $\frac{1}{2500}$ to $\frac{1}{3000}$ of an in. in diameter, and composed of a very delicate membrane lined with pavement epithelium. When they reach a size of $\frac{1}{250}$ of an in. in diameter, they are supplied with a fibrous coat, composed chiefly of inelastic, with a few elastic fibers; but the larger ducts, as afore-mentioned, are supplied with non-striated muscular fibers.

We came now to speak of another anatomical element in the structure of the liver. As the bile ducts increase in size they contain numerous follicles and cluster-like glands which are called racemose (the biliary acini of Robin), and they continue to occupy the biliary passages as far as the *ductus communis choledochus*, or the common bile duct which empties into the intestinal canal. Those which are found in the smallest ducts are simple follicles from $\frac{1}{300}$ to $\frac{1}{100}$ of an in. in length. The larger of these glands are formed of groups of these follicles, and are from $\frac{1}{300}$ to $\frac{1}{100}$ of an in. in diameter. The nutrition of the liver is provided for by the hepatic artery, whose distribution is exceed-

ingly interesting. It has three sets of branches. As soon as it enters the sheath formed by the capsule of Glisson, it sends off very fine branches, called *vasa vasorum*, to the walls of the portal vein, to those of the hepatic vein, to its own branches, and an exceedingly rich and beautiful net-work of branches to the hepatic duct. When the hepatic artery is well injected it almost completely covers the duct with its ramifications. The hepatic duct proper, or that single vessel so called lying outside of the liver, is formed by the union of two ducts, one from the right and one from the left lobe of the liver. It is about an inch and a half long, and joins the duct from the gall-bladder, called the cystic duct, to form the common duct, or *ductus communis choledochus*, which is about three inches long and of the size of a goose-quill, and empties, in common with the pancreatic duct, into the intestine, a little below the middle of the duodenum, or about 5 in. below the stomach. The gall-bladder is an elongated, pear-shaped sack about 4 in. in length and one in breadth, having a capacity of about one and a half fluid ounces. The cystic duct, connecting it with the hepatic duct, is the smallest of the three larger ducts, and is about one inch in length. In the gall-bladder there are also numerous small racemose glands similar to those above mentioned as existing in the biliary ducts generally. They consist each of from 4 to 8 follicles lodged in the submucous tissues. They secrete mucus mixed with bile. The idea has been entertained by some that these biliary racemose glands found in different parts of the biliary ducts were the bile-producing glands, while the hepatic cells were the organs for secreting sugar, or, in other words, for the conversion of the glycogenic matter of the liver into glucose, or grape-sugar; but this view has not been found tenable. The nerves of the liver are derived from the pneumogastric, the phrenic, and from the solar plexus of the great sympathetic. They all penetrate the gland at the great transverse fissure, and follow the blood-vessels in their course of distribution to the various parts of the organ, but their terminal distributions are not yet well understood. The lymphatic vessels of the liver are numerous and consist of two layers. The outer or superficial layer is situated immediately beneath the serous or peritoneal covering. The inner or deeper layer forms a plexus surrounding the lobules, having entered the liver along with the portal veins, hepatic arteries, and bile ducts, enveloped in sheaths of Glisson's capsule. In their course they invest the branches of both ducts and blood-vessels with a delicate net-work of tubes, and on arriving at the surface of the lobules they enter them and form another remarkable net-work of lymphatic passages, traversing the lobule in every direction. Every blood capillary is enveloped in a lymphatic sheath in very much the same manner that the interlobular vessels are enveloped in the sheath of Glisson's capsule. These lymphatic sheaths surrounding the other vessels are otherwise called the perivascular lymphatic spaces, and are similar in structure to those which are found in various other parts of the body. See LYMPHATICS.

The two distinct functions, that of the production of bile and the formation of sugar, which are now generally recognized as being performed by the liver have led some physiologists to suppose that this gland is composed of two distinct portions or anatomical elements, and Robin has adopted this theory and calls one portion of the liver a biliary organ, and the other a glycogenic or sugar-forming organ. The lobules and hepatic cells, with their different vessels, he regards as performing the glycogenic function, and the little racemose glands which are attached to the biliary ducts along their course as the bile-producing organs; and others have entertained ideas of the independence of the sugar-making and bile-producing portions of the organ. But from the fact that bile is commonly found in the lobules, and that the biliary capillaries are connected with the excretory biliary ducts, the conclusion seems to be unavoidable that the bile is formed in the lobules, and, moreover, by the hepatic cells. It, therefore, becomes a question as to what are the functions of the little racemose glands attached to the larger bile ducts. They have much the form of mucous glands in other portions of the body, and from the examinations of Sappey, who has found the bile to be viscid in proportion to the number of these glands in the ducts containing it, they appear to be really mucous glands. In the rabbit, an animal in which these glands are not found in this situation, the bile is quite fluid, and free from its ordinary viscidity. It has generally been thought that the bile is secreted exclusively from the blood which has been brought from the intestines by the portal vein, and that, indeed, the principal office of the liver was to separate effete matter from this portion of the venous system; but many experiments which have been made since Bernard discovered the glycogenic function of the liver go to show this idea erroneous. It has also been thought that the hepatic artery may furnish material for the secretion of bile, while the portal vein furnished that for the production of sugar; but these views again are quite overthrown by many well-established facts and experiments. It has been found that, after the ligation of the hepatic artery, bile has been secreted from blood furnished by the portal vein; and again, according to the experiments of Oré, who has succeeded in gradually obliterating the portal vein without immediately producing death, it has been found that bile is secreted from blood furnished by the hepatic artery. In one instance in which a patient died of dropsy the portal vein was obliterated, and yet the gall-bladder was full of bile. Anomalous cases have been reported where the portal vein, instead of passing through the liver, emptied into the ascending vena cava, and where also there was found no deficiency of bile. These facts point to the conclusion that the secretory elements of

the liver have an elective power, and that this gland may elaborate its products either from venous or arterial blood. The only conclusion, therefore, is that the liver produces bile from both the portal vein and the hepatic artery, and that the secretion may be kept up if either one of these vessels be obliterated. The natural color of bile is variable; in the pig it is bright yellow; in the dog, dark brown; and in the ox, greenish yellow. In general, it may be stated that it is dark green in carnivorous, and greenish yellow in herbivorous animals. Its specific gravity is variously stated. Some authorities place it at 1026; others from 1020 to 1026; and again others from 1026 to 1031. These differences are considerable, but the numbers were probably the result of exact observation, as the bile is found to differ under different circumstances. See table. Fresh bile is nearly inodorous, but after being taken from the body of an animal it soon undergoes putrefactive changes. It has been generally thought to be invariably alkaline, and this is true of that which is found in the hepatic duct, but it often has an acid reaction after it has passed into the gall-bladder.

COMPOSITION OF THE BILE, ACCORDING TO ROBIN.

Water	916.00 to	819.00
Taurocholate of soda	56.50 "	106.00
Glycocholate of soda	traces.	
Cholesterine	0.62 to	2.66

The bile contains two classes of constituents, one of which are true secretions, and destined to re-enter the system and perform certain functions. They contain, with other matters, some that are formed in the liver, and are no doubt elaborated from materials furnished by the blood. These are the salts included in the above table under the names of taurocholate and glycocholate of soda. Biliverdine, the coloring matter of the bile, is probably a mixture of different coloring principles which undergo rapid change on exposure to the air. It has some analogy to the coloring matter of the blood, and it is also, like the biliary salts, supposed to be formed in the liver. This coloring matter has intense power, and in cases of obstruction of the biliary passages will give the skin and conjunctivæ a decidedly yellow color. Like hemoglobine, it contains a portion of iron, but the relative amount has never been ascertained. The other constituent of the bile is truly excretory, being composed of effete matter brought by the blood-vessels from the various parts of the system. This excretory constituent is *cholesterine*, a substance which has long been known as a constituent of the bile, whose chemical and physical characteristics were well recognized, but whose physiological relations were not understood. It was reserved for Dr. Austin Flint, jr., of New York, to discover these and make them known in the *American Journal of Medical Sciences* in 1862. Cholesterine is a normal constituent of various of the tissues and fluids of the body. It is found in the blood, liver (probably as contained in the bile), crystalline lens, spleen, meconium, and in the nervous tissue in all parts of the body. It is also found in an altered condition, as stercorine, in the fecal matter, and as unchanged cholesterine in hibernating animals. It is naturally a crystalline solid, but in the fluids of the body it is held in solution. For the form of the crystals, composition, and other characteristics, see CHOLESTERINE. This body is found in the largest quantity in the substance of the brain and nerves, and the blood coming from the brain contains a much larger percentage of it than is found in that coming from any other organ. From this and various other experiments, Dr. Flint has demonstrated that cholesterine is a disassimilative product of nervous function, and that one of the offices of the liver is to separate it from the blood. He found among other things that it is produced in much greater quantity under active conditions, and that it is also produced in all parts of the nervous system. Sometimes the liver fails to separate it from the blood, when it collects, and produces a condition to which Dr. Flint has given the name *cholesteræmia*, a species of blood-poisoning having an analogy to *uræmia*, or blood-poisoning from accumulation of urea consequent upon disease of the kidneys. In regard to the glycogenic function of the liver, it may be stated that nearly all physiologists admit that Bernard demonstrated it completely, although for a long

time many apparently well-made experiments seemed to throw great doubt on the subject, some believing that the sugar found by Bernard was a product of post-mortem changes. It is a fact that it is difficult to find sugar in the liver which may not be said to be produced after death; consequently, demonstrative experiments are exceedingly difficult. On examining the blood which comes from the lungs in animals upon which vivisection has been performed it is found to contain no sugar. Other experiments have left no doubt of the fact that, to serve some purpose in the animal economy, sugar is destroyed in its passage through the lungs, the most generally received view being that it is converted into lactic acid, which unites with the alkalies in the blood to form lactates, which again are converted into carbonates. It is thought that among the causes of the disease diabetes is an abnormal performance of the function of respiration (q.v.). The glycogenic matter of the liver, in composition, reactions, and particularly in its readiness to be transformed into sugar, has considerable resemblance to starch, and is called by some authors amyloid matter. On account of its insolubility in water it may be extracted from the liver after all the sugar has been washed out.

LIVER, Diseases of the. *Congestion* of the liver is one of the most frequent of its morbid conditions. It is most commonly caused by obstruction to the passage of the blood from the hepatic veins, arising from thoracic disease impeding the circulation through the right side of the heart. The congestion may be relieved at this stage, or may, by its obstructive action, cause congestion of the portal branches, in which case we have the liver much enlarged, the complexion dusky, the urine high colored, sedimentary, and scanty, and often more or less dropsy of the abdomen or lower extremities. The treatment must be left entirely to the physician.

Inflammation of the liver has been already noticed in the article Hepatitis.

Another important affection of the liver is that which is known by the name of *cirrhosis* (Gr. *kirrhos*, yellowish). It begins as an inflammatory affection, in which lymph (see Inflammation) is effused in the areolar tissue surrounding the branches of the portal vein. The smaller branches become obliterated by the pressure, and as the lymph subsequently contracts, larger branches of the veins and ducts become strangulated, and the surface of the organ assumes the uneven or bossed appearance known as *hobnailed*. In this affection, the liver is at first somewhat enlarged, but as the contraction of the effusion goes on, it at length becomes considerably smaller than the natural size. The ordinary cause of this disease is spirit-drinking, and it is popularly known as *the gin-drinker's liver*. The obstruction to the portal circulation occasions the effusion of serum into the peritoneal cavity; and this effusion often goes on so rapidly as soon to force up the diaphragm and impede respiration. The lower extremities soon become anasarcous, but the arms and face are never affected. The portal obstruction often also gives rise to hemorrhage from the bowels or stomach.

In a fully developed case of cirrhosis, the liver is so altered in structure that palliative treatment is all that can be attempted. This must be directed to the relief of the dropsy, and if medicines fail to remove or diminish it, temporary relief may be obtained by tapping. The disease is at best a very hopeless one.

Amongst the other affections of this organ are the *fatty liver*. The liver in this case is much enlarged, of a white color, and rounded at the edges; it is most commonly found associated with phthisis. Closely allied to this is the *lardaceous* or *waxy* liver, in which the deposited matter is not fat, but something between fat and albumen; it chiefly occurs in scrofulous young persons. Tubercle, different forms of cancer, and hydatids (q.v.) are not unfrequently found in this organ. In connection with the present subject, the reader is referred to the article Jaundice.

LIVERMORE, Abiel Abbot, b. Wilton, N. H., in 1811; graduated at Harvard college in 1833; in 1857 removed to Yonkers and became editor of the *Christian Enquirer*, a Unitarian paper in New York; since 1863 president of a theological school at Meadville, Penn. Besides contributions to magazines, Mr. Livermore is author of *A Commentary on the Four Gospels; A Commentary on the Acts of the Apostles; The Marriage Offering*, a prize essay on the Mexican war; and several other works.

LIVERMORE, George, 1809–65; b. Cambridge, Mass.; received his education at the public schools; after being carefully trained for a mercantile lif ehe entered into business in Boston as a wool-commission merchant, and was very successful. From early life he devoted his leisure hours to historical and antiquarian researches, in regard to which he became a recognized authority. His collection of editions of the Bible in different languages is believed to have been the finest in America. He was honored by an election to the Massachusetts historical society, the American antiquarian society, the American academy of arts, and the Boston athenæum. He frequently wrote upon bibliographical and historical subjects for newspapers and reviews, his contributions being invariably marked by a clear and vigorous style, and showing the results of extensive and accurate research. Among these contributions was a series of papers on the *New England Primer*, written for the *Cambridge Chronicle*, and an article in the *North American Review* on *Public Libraries;* but the most important of all his essays was *An Historical Research respecting the Opinions of the Founders of the Republic on Negroes as Slaves, as Citizens, and as Soldiers*, read before the Massachusetts historical society, Aug.

14, 1862, and published not only in the *Proceedings* of that society, but in a separate volume of 215 pages. During the war of the rebellion Mr. Livermore was a firm and generous supporter of the government, sparing neither time, strength, nor money in efforts to uphold the union. Died in Cambridge.

LIVERMORE, Mary Ashton; b. Boston, 1821; daughter of Timothy Rice; educated in the Baptist seminary for girls at Charlestown, Mass.; married D. P. Livermore, a Universalist clergyman, and assisted him for some time in editing a Universalist paper in Chicago; distinguished herself during the war of the rebellion by her labors for the soldiers, under the direction of the sanitary commission; of late years has stood in the front rank of popular lecturers upon moral and social questions, and taken a very prominent part in the total-abstinence cause, and in the movement to secure suffrage for woman. She was for several years one of the associate editors of the *Boston Woman's Journal*.

LIVERPOOL, situated on the n. bank of the Mersey, Lancashire, is, after London, the largest t. in the United Kingdom, and, taken in connection with Birkenhead, on the opposite side of the Mersey, it ranks in maritime importance before the metropolis itself —a circumstance due to its position on the w. coast of England, not only as a port for the adjacent manufacturing districts, but for the traffic with America. It is situated at one hour's distance by railway from Manchester, five hours from London, six hours from Edinburgh, and eight hours by steam from Dublin. The rise of Liverpool is remarkable. In the middle of the 14th c. it contained only 840 inhabitants and 168 cottages; whilst in 1561 its population was only 690. It was not until 1647 that it was made a free port (having been subject down to that date to the Chester officers); whilst its distinct individuality as a parish was not declared until 1697, when its population numbered about 5,000 souls, and its shipping about 80 vessels. Between 1710 and 1760 its population increased from 8,160 to 25,780, and its commercial navy from 84 vessels to 1245 vessels. In 1700 its first regular dock was built, on the site where the custom-house stands at the present day. From 1760 to 1800 the population advanced from 25,700 to 77,700 inhabitants; the shipping from 1200 vessels to 5,000 vessels; and the amount of dock dues collected, from £2,300 to £28,300; nearly two-thirds of the increase taking place during the last 15 years of the period. The rapid progress of the cotton trade was the chief cause of this almost sudden improvement. Simultaneously with the mechanical revolution brought about by Hargreaves, Arkwright, Crompton, and others, there came an increased foreign trade, and an augmented inland business, owing to the opening of the Bridgewater canal in 1773. About the same period, too, a great start was given to the ship-building trade of the port by several extensive orders received from the government, some 15 vessels of war being launched between 1777 and 1782 of very considerable tonnage, and ranging between 16 and 50 guns. By this time Liverpool had far outstripped Bristol in commercial importance, the trade of the latter port being in process of rapid transference to the former. The following statement will show how far Liverpool was benefited by the cotton trade:

Years.	Raw Cotton.		Cotton Manufactures.	Population.	Vessels.	Dock Duties Collected.
	Imported. lbs.	Exported. lbs.	Exported. £	No.	No.	£
1781.....	5,198,778	96,788	355,000	35,000	2,300	5,000
1791.....	31,447,605	363,442	1,875,000	50,000	4,200	10,000
1800.....	43,378,278	4,416,610	6,040,000	77,000	5,000	28,000

But this progress, important as it was, has been far exceeded by the subsequent increase of business, and at the present time, as regards exports, Liverpool stands at the head of British commercial ports, and is excelled by London alone in its imports. Its rapid growth will be seen from the following table:

Years.	Population.	Vessels.	Tonnage.	Dock Dues.
1801.....	77,708	5,060	459,719	£28,365
1831.....	205,572	12,537	1,592,436	183,455
1861.....	443,938	21,095	4,977,272	444,417
1871*.....	493,346	20,121	6,131,745	562,953

The following table will show the comparative importance of the export and import trade of Liverpool:

* Including West Derby and Birkenhead, the pop. in 1871 reached 650,510, against 557,027 in 1861.

DECLARED REAL VALUE OF BRITISH AND IRISH EXPORTS AND IMPORTS IN 1877.

	Exports.	Imports.
Liverpool	£72,864,643	£99,145,818
London	59,985,826	140,390,333
Hull	17,816,719	18,966,385
Grimsby	7,509,439	4,076,796
Glasgow	8,829,253	10,713,587
All others	31,877,185	121,126,763
	£198,883,065	£394,419,682

This gigantic trade has given being to the magnificent system of docks, extending along the margin of the river for a distance of about 5 m., containing 54 docks and basins, covering an area of over 260 acres, and having nearly 19 m. of quay space. The whole of these docks have, with the exception of the Salthouse, King's, part of the George's, and part of the Queen's, been built since 1812. They were erected chiefly under the superintendence of the late Jesse Hartley, esq., and are considered by all who have seen them to be one of the greatest engineering triumphs of the present century. Several of the docks are inclosed with large warehouses: the erection of those round the Albert dock cost £358,000, and the dock itself £141,000. In addition to the usual pier approaches, there are two large floating landing-stages, one of which is 1002 ft. in length, 80 ft. in width, and 4,500 tons in weight. In the general traffic of Liverpool, that carried on by large steamers with United States, Canadian, South American, Mediterranean, Australian, and other ports, has deservedly attained celebrity, and draws large numbers of passengers to the town.

The approaches to the town on the land sides are the Lancashire and Yorkshire, East Lancashire, London and North-western, Great Northern, Midland and Manchester, Sheffield and Lincoln railways. There are four tunnels under the town in connection with the London and North-western railway, and one in connection with the Midland railway, taking different directions, varying from a mile and a half to two miles and a half in length. The passenger stations in Lime street, Ranelagh street, and Tithebarn street are large and handsome buildings.

The architecture of the town has been wonderfully improved within the past thirty or forty years, and especially during the latter half of the period, and it now possesses many fine thoroughfares, thronged with numerous splendid edifices. There are several large and elegant squares in the e., or fashionable part of the town, and a number of thoroughfares, lined with the private residences of the merchants and tradesmen; while the outskirts of the town are studded with the mansions of the commercial aristocracy. Of what may be termed the official buildings—the town-hall, St. George's hall, public offices, custom-house, sailors' home, police-offices, workhouses, baths and wash-houses, waterworks, and gas offices, are the most noteworthy; next follow the various literary and educational edifices, such as the free library and museum, presented to the town by sir William Brown, at a cost of £40,000; the Walker art gallery, presented by A. B. Walker, esq., at a cost of £30,000; botanic gardens, observatory, the Liverpool college, Liverpool institute, queen's college, medical institute, royal institution, the various schools attached to the national and other churches, academy of fine arts, the exchange, lyceum, and atheneum, news-rooms and libraries, and numerous associations devoted to commercial, political, and religious affairs. That the inhabitants are not niggardly is proved by the fact that there are about 100 charitable institutions in the borough devoted to the alleviation of the various evils that flesh is heir to. Among the more prominent are the royal infirmary, northern and southern hospitals, industrial schools, blue-coat orphan schools; male, female, and infant orphan asylums and church; school, workshops, and church for the blind; deaf and dumb, and eye and ear institutions; homeopathic and other dispensaries; lying-in and other hospitals. Visitors will find no lack of hotel accommodation, with such immense establishments as the North-western, Adelphi, Washington, Queen's, Alexandra, Royal, Angel, and a score or two of minor importance. The buildings dedicated to amusements are quite in keeping with the other characteristics of the town. Under this head there are the Philharmonic hall, capable of accommodating 3,000 people; the Alexandra theater; the amphitheater, calculated to hold 5,000; the two concert-rooms of St. George's hall, before alluded to, the larger of which is acknowledged to be one of the finest rooms in the kingdom; St. James's hall, the Queen's hall, the Theater-Royal, Prince of Wales's theater, Rotunda theater, Adelphi theater, circus, etc. The religious wants of the community are supplied by about 187 churches and chapels, of which 73 belong to the established church, 21 to Roman Catholics, 21 to Presbyterians, 13 to Wesleyans, 16 to Independents, 16 to Baptists, and 27 to miscellaneous non-conformists, including 3 Unitarian, 2 Jewish, 1 German, and 1 Greek. There are 8 cemeteries, one only of which is situated within the town, namely, St. James's, Duke street, the remainder being laid out in the suburbs.

The buildings devoted to commercial pursuits are also very fine and numerous, and not the least interesting to the stranger. Amongst these are the exchange, the Albany,

Apsley, Brown's, Richmond, Hargreaves, Liverpool and London insurance chambers, Royal insurance, and Queen insurance buildings (all local companies), Manchester, Knowsley, Walmer, Drury, Tower, India, and Brunswick buildings, and many others. There are 12 banks in the town, and several of them are possessed of very large and handsome business premises. Amongst these may be named the branch of the bank of England, and the Liverpool, Union, District, Commercial, National, and North and South Wales banks. In the principal streets there are also several very extensive trade establishments, devoted to every department of business, wholesale and retail. Of monuments, the chief are those of the queen, prince Albert, Nelson, Wellington, Huskisson, and William IV., besides several in the town-hall, St. George's hall, free library, and parks. The parks are four in number, the Stanley, the Sefton, the Prince's, and the Botanic.

The stated market days are Wednesday and Saturday, for general agricultural produce, and Tuesday and Friday for corn. The fairs for horses and cattle are held July 25 and Nov. 11. The corn trade transacts its business in the corn exchange, Brunswick street, and there is an extensive market for the cattle-dealers in Kensington. For agricultural produce there is the northern hay market. For edibles of all kinds there are St. John's market, 183 yards long, 43 yards wide, and lighted by 136 windows; St. James's, Gill street, and St. Martin's markets; there is also a fish market, and several fancy bazaars. There are 6 daily and 7 weekly newspapers, besides the *Daily Telegraph* and *Bill of Entry*, exclusively devoted to shipping matters, and three weekly literary periodicals. Liverpool has several extensive ship-building yards, iron and brass foundries, chain-cable and anchor smithies, engine-works, tar and turpentine distilleries, rice and flour mills, tobacco, cigar and soap manufactories, breweries, sugar refineries, roperies, glass-works, alkali-works, chronometer and watch manufactories. It returns 3 members to parliament.

LIVERPOOL, a t. in Nova Scotia, on the river Mersey, 70 m. s.w. from Halifax; pop. 3,102. It is a port of entry, has a fine harbor with light-house and revolving light, and is an active commercial and manufacturing center, making castings, machines, boots and shoes, and edge-tools, besides being engaged in ship-building. The inhabitants are also largely employed in lumbering and fishing; and considerable quantities of the product of these industries are exported to Europe and the West Indies.

LIVERPOOL, Charles Jenkinson, first earl of, 1727–1808; b. Oxfordshire, Eng.; educated at the charter-house school, London, and the university of Oxford. In early life he published *Verses on the Death of Frederick, Prince of Wales;* a *Dissertation on the Establishment of a National and Constitutional Force in England Independently of a Standing Army;* and a *Discourse on the Conduct of Government respecting Neutral Nations.* In 1761 he became one of the under-secretaries of state, and the same year was elected to parliament; in 1763 was appointed joint secretary of the treasury; in 1766, made lord of the admiralty by the Grafton administration; in 1772 appointed one of the vice-treasurers of Ireland; in 1776, minister of the mint; was secretary of war, 1778–82; in 1783 was appointed by Pitt a member of the board of trade. In 1785 he published a *Collection of all the Treaties of Peace, Alliance, and Commerce between Great Britain and other Powers, from the Treaty of Munster in* 1648 *to the Treaties signed at Paris in* 1783. In 1786 he was made chancellor of the duchy of Lancaster, created baron Hawkesbury, and appointed president of the board of trade; in 1796 was made earl of Liverpool. After this he withdrew mostly from public life.

LIVERPOOL, Robert Bankes Jenkinson, second earl of, 1770–1828; educated at the charter-house school and Christ-church college, Oxford; traveled on the continent, and was in Paris at the breaking out of the French revolution and the destruction of the bastile. Returning to England he was elected to parliament in 1790, but did not take his seat till the following year as he had not yet attained his majority. In 1792 he opposed Mr. Wilberforce's motion for the abolition of the slave trade. In 1793 he was appointed one of the commissioners of the India board of trade. In 1796, his father being created earl of Liverpool, he took his title of lord Hawkesbury, and was made commissioner of Indian affairs. On the retirement of Mr. Pitt in 1801 and the appointment of the Addington ministry, he was appointed secretary of state for the foreign department, and negotiated the treaty of Amiens. On the return of Pitt to power, Liverpool was home secretary 1805–7, and, on the death of Pitt, was offered the premiership, but declined. In 1808, on the death of his father, he became earl of Liverpool. Upon the dissolution of the Fox and Grenville administration in 1807 he again refused the premiership, but accepted the home department under Percival, on whose assassination in 1812 Liverpool became prime minister, with the title also of the first lord of the treasury. His administration extended from 1812 to 1827. His opposition to parliamentary reform, to Roman Catholic emancipation, to the abolition of the slave trade, and the emancipation of the slaves in the West Indies, his severe measures to repress internal disturbances, and his introduction of the bill of pains and penalties against queen Caroline, rendered him very unpopular, especially in Scotland. He was attacked with paralysis, and during the last three months of his life was helpless and imbecile.

LIVERWORTS. See Hepaticæ, *ante.*

LIV'ERY, in English law, denotes the act of giving or taking possession. It is most frequently used in the phrase "livery of seisin," corresponding to the Scotch infeftment or sasine.

LIV'ERY (from Lat. *liberatio*), a word applied in its origin to the custom which prevailed under the Merovingian and Carlovingian kings, of delivering splendid habits to the members of their households on great festivals. In the days of chivalry the wearing of livery was not, as now, confined to domestic servants. The duke's son, as page to the prince, wore the prince's livery, the earl's son bore the duke's colors and badge, the son of the esquire wore the livery of the knight, and the son of the gentleman that of the esquire. Cavaliers wore the livery of their mistresses. There was also a large class of armed retainers in livery attached to many of the more powerful nobles, who were engaged expressly to use the strong hand in their master's quarrels. By the colors and badge of the retainer was known the master under whom he served. The livery colors of a family are taken from their armorial bearings, being generally the tincture of the field and that of the principal charge, or the two tinctures of the field are taken instead, where it has two. They are taken from the first quarter in case of a quartered shield. These same colors are alternated in the wreath (q.v.) on which the crest stands. The royal family of England have sometimes adopted colors varying from the tinctures of the arms. The Plantagenets had scarlet and white; the house of York, murrey and blue; white and blue were adopted by the house of Lancaster; white and green by the Tudors; yellow and red by the Stuarts, and by William III.; and scarlet and blue by the house of Hanover. An indispensable part of the livery in former times was the badge (q.v.) The church of Rome has its liveries for apostles, confessors, martyrs, virgins, and penitents.

The freemen of the 91 guilds or corporations which embrace the different trades of London, are called liverymen, because entitled to wear the livery of their respective companies. In former times the wardens of the companies were in use yearly to deliver to the lord mayor certain sums, 20 shillings of which was given to individuals who petitioned for the money, to enable them to procure sufficient cloth for a suit, and the companies prided themselves on the splendid appearance which their liveries made in the civic train. The common councilmen, sheriffs, aldermen, and some other superior officers of the city are elected by the liverymen of London; and till the reform bill in 1832, they had the exclusive privilege of voting for members of parliament for the city.

LIVERY COMPANIES, or GUILDS. See GUILDS; LIVERY; *ante*.

LIVERY OF SEISIN. See FEOFFMENT, *ante*.

LIVIA DRUSILLA, B.C. 56–A.D. 29; married early to Tiberius Claudius Nero, by whom she had two sons—Tiberius and Drusus. While pregnant with the latter she met Augustus, whom she so fascinated by her beauty that he compelled her husband to surrender her to him, at the same time divorcing his own wife, Scribonia. The married life of Augustus and Livia is said to have been in most respects happy; but it was marred at the close by the suspicions of the husband that the wife, in spite of her apparent devotion to his person and interests, had plotted the overthrow of the natural heirs of his throne. One by one the members of the large and brilliant family of Augustus had been ruined, and the aged emperor found himself alone in the palace with Livia and her son Tiberius, whom he was constrained to adopt and make his heir. The Roman people execrated her, and her son Tiberius, after his ascent to the throne, showed her no favor or respect. He even refused to visit her in her dying moments, or to take any part in the funeral rites. She survived Augustus 15 years, dying at Rome.

LIVINGSTON, a co. in n.e. Illinois; 1026 sq.m.; pop. '80, 38,453. Traversed by the Vermilion river, and by the Chicago and Alton; Toledo, Peoria, and Warsaw; and Illinois Central railroads. The soil is fertile, the surface generally level. Productions: Indian corn, wheat, oats, potatoes, and hay; other staples are wool and butter. There are a number of manufactories of carriages, metal goods, saddlery and harness, etc. Co. seat, Pontiac.

LIVINGSTON, a co. in w. Kentucky, having the Ohio river on the n. and the Tennessee on the s., and intersected by the Cumberland; 275 sq.m.; pop. '80, 9,165. The soil is fertile. Productions: wheat, Indian corn, oats, tobacco, and potatoes. There are a few flour and saw mills, but no other important manufactures. Co. seat, Smithland.

LIVINGSTON, a s.e. parish of Louisiana, having the Amite river on the s. and w., and the Tickfah intersecting it; 650 sq.m.; pop. '80, 5,258. The surface is level and the soil fertile, producing cotton, Indian corn, rice, sweet-potatoes, and sugar-cane. Co. seat, Springfield.

LIVINGSTON, a co. in s.e. Michigan, traversed by the Red Cedar, Huron, and Shiawassee rivers, and by the Detroit, Lansing, and Lake Michigan railroad; 576 sq.m.; pop. '80, 22,251. The soil is fertile, and produces heavily of wheat, Indian corn, oats, and potatoes; wool, butter, hay, and hops are also staple products. Co. seat, Howell.

LIVINGSTON, a co. in n.w. Missouri, traversed by the Grand river and crossed by the Hannibal and St. Joseph and a branch of the St. Louis, Kansas City, and Northern railroads; 510 sq.m.; pop. '80, 20,205. The productions are Indian corn, oats, wheat,

tobacco, hay, potatoes, butter, and wool. There are a number of mills and manufactories of flour, lumber, metal wares, sash, doors, and blinds, etc. Co. seat, Chillicothe.

LIVINGSTON, a co. in w. New York, intersected by the Genesee river and canal, drained by Honeoye and Canaseraga creeks, and traversed by the N. Y. Central and Erie railroads, and branches of the latter; 650 sq.m.; pop. '80, 39,573. The surface is varied, being hilly in parts, and is generally well wooded. The fertile and beautiful Genesee valley lies in this county and is one of its chief features, the soil being highly productive. The principal agricultural products are Indian corn, wheat, barley, hay, and oats; butter and wool are also important staples. The Avon saline-sulphurous springs are in this country, and are much frequented by persons suffering from rheumatism and from cutaneous diseases, as to which the waters are believed to exercise a specific remedial influence. This county has valuable quarries of sandstone. Co. seat, Geneseo.

LIVINGSTON, Brockholst, ll.d., 1757–1823; b. N. Y.; son of William; educated at Princeton, and in 1776 entered the army on gen. Schuyler's staff. He was afterward with Arnold, and was brevetted maj. and col. In 1779 he became secretary to John Jay. After the war he studied law, and in 1802 was appointed a judge of the N. Y. supreme court. For the last 17 years of his life he occupied the eminent position of judge of the U. S. supreme court, and died at Washington.

LIVINGSTON, Edward, an American jurist and statesman, was b. on May 26, 1764, at Livingston (afterward Claremont), in the state of New York. He belonged to a family which, for nearly a century, had been of the greatest weight and distinction in the colony. Livingston was the son of Robert Livingston, judge of the supreme court of New York, and the youngest of a very numerous family. After leaving the college of Princeton, he studied law under his brother Robert, 18 years his senior (see below), and devoted special attention to Roman jurisprudence. On being called to the bar, he soon obtained an extensive practice. He had spent his youth among the founders of American independence, all of whom he had known as visitors of his father, and he at once attained a prominent position. He was elected a member of congress in 1794; federal attorney and mayor of New York in 1801; and he would probably have been known only as a prosperous lawyer had not a great misfortune at this period befallen him. Livingston, as federal attorney, was intrusted with the collection of debts to the state recovered by legal proceedings. He had the greatest aversion to accounts, and intrusted this part of his duty to a clerk, a Frenchman, who appropriated the funds to his own purposes. When Livingston discovered what had happened, he at once ascertained the balance due to the state, handed over his whole property to his creditors, threw up his appointment, and resolved to quit New York. No entreaty on the part of his fellow-citizens could induce him to remain. Louisiana had just been annexed to the United States, thanks to negotiations conducted by his brother at Paris, and he resolved to settle in the new state. He joined the New Orleans bar in 1804, and at once obtained lucrative practice. He had great difficulties to encounter. The business had to be conducted partly in French and Spanish. The law administered was a strange compound of municipal regulations, Spanish and French law, and the Roman law of the civilians. A proposal was made to introduce the common law of England, and this would have been much to the pecuniary advantage of Livingston, but he opposed the scheme in an eloquent and convincing speech to the Louisiana chambers, and it was decided that the law of the state should remain based upon the civil rather than the common law. In the dispute with England in 1814 and 1815, Livingston became aid-de-camp and secretary to gen. Jackson, and attracted much notice by the admirable bulletins he wrote during the campaign. In 1820 he was appointed to draw up a code of civil procedure for Louisiana. It was the simplest known up to that time, was found to work admirably, and received the warmest approval from Bentham and other jurists. Livingston was then employed in reducing to system the civil laws of Louisiana. He had to aid him in the task the French and other modern codes, the nomenclature of Scotch law, and a familiar acquaintance with all that is most valuable in English jurisprudence, and the work produced, the "Civil Code of Louisiana," is undoubtedly the most successful adaptation of the civil law to the conditions of modern society. It was adopted in Louisiana in 1823, and has since become the law of many other states. Livingston was then employed to prepare a new criminal code, and in a preliminary treatise he laid down the principles on which he was to proceed. He proposed the abolition of the punishment of death, and a penitentiary system, which at once drew general attention to his labors. His book was reprinted in London, translated into French, and made a sensation all over Europe, and the author received the congratulations of the most eminent publicists and politicians of England, France, and Germany. His code of crimes and punishments was completed, but not adopted without modifications. Livingston was elected in 1829 member for Louisiana of the American senate, and in 1831 appointed secretary of state for foreign affairs. Two years later he went to France as minister plenipotentiary to support a demand of a million sterling made by the U. S. government for indemnity on account of French spoliations, and he succeeded in securing payment. He had married a lady of New Orleans, of French family and education, had been long conversant with the French language, in which he had been accustomed to plead before the courts of

New Orleans, and he became intimately acquainted with the leading jurists and politicians of France. He was admitted an associate of the academy of moral and political sciences, and received the warmest tribute of respect as one of the greatest philosophical lawyers of his time, although his distinction at home had been chiefly won as a careful and painstaking man of business. Livingston died on May 23, 1836, at his own estate on the Hudson, in consequence of drinking cold water when very hot.—See notices of his life in French by M. Taillandier and by M. Mignet, and a long biography by Mr. H. Hunt, with introduction by S. Bancroft.

LIVINGSTON, HENRY BEEKMAN, 1750–1831; b. at Livingston manor, N. Y.; son of judge Robert R. Raising a military company in 1775, he joined Montgomery's expedition to Canada. For gallant conduct at the capture of Chambly, congress voted him a sword of honor. In 1776 he became aide-de-camp to gen. Schuyler, and later in the same year col. of the 4th battalion of New York volunteers, resigning in 1779. Bred to the law, he successively filled the posts of attorney-gen., judge, and chief-justice of the supreme court of New York. He was also president of the New York society of Cincinnati; and during the war of 1812 he received the appointment of brig.gen. Died at Rhinebeck.

LIVINGSTON, JOHN. See LIVINGSTON, ROBERT R., *ante*.

LIVINGSTON, JOHN HENRY, D.D., 1746–1825; b. N. Y.; graduated at Yale college in 1762; studied theology at Utrecht, Holland; ordained at Amsterdam in 1770; received the title of D.D. from Utrecht; returning to the United States, became pastor of the Dutch church in New York, and during the war preached in Albany, Kingston, and Poughkeepsie; appointed professor of divinity by the general synod of America in a seminary opened under his direction at Bedford, L. I., in 1795, which being united in 1807 with Queen's (now Rutger's) college, New Brunswick, he became its president and professor of theology. He spent the remainder of his life in New Brunswick.

LIVINGSTON, PHILIP, 1716–78; b. Albany, N. Y.; grandson of John Livingston, to whom grants of land on the Hudson river were made by George I. A graduate of Yale college in 1737, he became a successful merchant in New York, a member of its city council, and a member from the city to the colonial assembly of New York from 1758 to 1769. He was elected to the continental congress, and is best known as one of the signers of the declaration of independence. He was in service in that congress then in session at York, Penn., at the time of his death. He was distinguished, like all the family, for resolute patriotism in aiding the cause of the colonies in their struggle for independence.

LIVINGSTON, ROBERT R., brother of EDWARD, an eminent lawyer and politician, was b. in New York in 1746. He was one of the five members of the committee charged with drawing up the declaration of independence. When the constitution of the state of New York was settled, he was appointed chief judge, a dignity he retained till 1801. He was then sent to Paris as minister plenipotentiary to negotiate the cession of Louisiana to the United States, a duty he discharged with rare ability. He enabled Fulton to construct his first steamboat, and introduced in America the use of sulphate of lime as a manure, and the merino sheep, and in many other ways distinguished himself as a national benefactor. He died Mar. 26, 1813.

The Livingstons, whose lives have just been recorded, belong to an American family remarkable for hereditary talent and the large number of its members who have distinguished themselves in the United States as eminent men of letters, magistrates, lawyers, and divines. They descend lineally from the fifth lord Livingston, who was intrusted with the guardianship of Mary queen of Scots, and from the Rev. John Livingston, minister of Ancrum, in Teviotdale, the grandson of the nobleman, one of the most distinguished of the Presbyterian divines. John Livingston was born at Kilsyth, on June 21, 1603, preached with great success in Ireland, and was one of two commissioners sent by the Scotch kirk to Breda, in Holland, to treat with Charles II. Refusing to take the oath of allegiance, he was banished, and in 1663 went to Holland, where, as pastor of the Scotch kirk at Rotterdam, he spent the last years of his life. He was the author of several works, the best known of which is his autobiography. His son Robert was born at Ancrum in 1654, and while still a lad emigrated to America, and settled in the Dutch village of Albany, in the region of the upper Hudson. He bought from the Indians a vast tract of land on the banks of the river, embracing upwards of 160,000 acres; and this property he had erected into the lordship and manor of Livingston.

LIVINGSTON, WILLIAM, LL.D., 1723–90; b. Albany; brother of Philip (q.v.); graduated at Yale, 1741; governor of New Jersey, 1776–90. He was elected to the continental congress of 1774, was a delegate to the constitutional convention of 1787, and the author of a number of legal and political treatises. His life was one of patriotic devotion as jurist, legislator, and magistrate.

LIVINGSTONE, DAVID, African traveler and missionary, was a native of Scotland, and was born at Blantyre, in Lanarkshire, in the year 1817. At the age of ten he became a "piecer" in a cotton-factory, and for many years was engaged in hard work as an operative. An evening-school furnished him with the opportunity of acquiring some

knowledge of Latin and Greek, and finally, after attending a course of medicine at Glasgow university, and the theological lectures of the late Dr. Wardlaw, professor of theology to the Scotch Independents, he offered himself to the London missionary society, by whom he was ordained as a medical missionary in 1840. In the summer of that year he landed at Port Natal in s. Africa. Circumstances made him acquainted with the rev. Robert Moffat, himself a distinguished missionary, and whose daughter he subsequently married. For 16 years Livingstone proved himself a faithful and zealous servant of the London missionary society. The two most important results achieved by him in this period were the discovery of lake Ngami (Aug. 1, 1849), and his crossing the continent of s. Africa, from the Zambesi (or Leeambye) to the Congo, and thence to Loando, the capital of Angola, which took him about 18 months (from Jan., 1853, to June, 1854). In Sept. of the same year he left Loando on his return across the continent, reached Linzanti (in lat. 18° 17′ s., and long. 23° 50′ e.), the capital of the great Makololo tribe, and from thence proceeded along the banks of the Leeambye to Quilimane on the Indian ocean, which he reached May 20, 1856. He then took ship for England. In 1857 Livingstone published his *Missionary Travels and Researches in South Africa*, a work of great interest and value. Returning in 1858 as British consul at Quilimane, he spent several years in further exploring the Zambesi, in ascending the Shiré, and discovering lake Shirwa and lake Nyassa—the Maravi of the old maps. A narrative of these discoveries was published during a visit he paid to England in 1864–65. In the mean time, lakes Tanganyika, Victoria Nyanza, and Albert Nyanza had been discovered by Burton, Speke, and Baker, but the true source of the Nile was still a problem. With a view to its solution, Livingstone, in 1866, entered the interior, and nothing was heard of him for two years. The communications received from him afterwards describe his discovery of the great water-system of the Chambeze in the elevated region to the s. of Tanganyika. It flows first w. and then turns northward, forming a succession of lakes, lying to the w. of the Tanganyika. To determine its course after it leaves these, whether it joins the Nile or turns westward and forms the Congo, was the grand task which Livingstone seemed resolved to accomplish or perish. He was much baffled by inundations, the hostility of the slave-dealers, and by the want of supplies, which were habitually delayed and plundered by those who conveyed them. When nothing certain had been heard of him for some time, Mr. Stanley, of the *New York Herald*, boldly pushed his way from Zanzibar to Ujiji, where, in 1871, he found the traveler in great destitution. On parting with Mr. Stanley, Livingstone started on a fresh exploration of the river-system of the Chambeze or Lualaba, convinced that it would turn out to be the head-waters of the Nile. In May, 1873, however, he died at Ilala, beyond lake Bemba. His body was brought home in April, 1874, and interred in Westminster abbey. His *Last Journals* were preserved, and published in Dec., 1874.

LIVINGSTONE, DAVID, LL.D. (*ante*). When left by Mr. Stanley at Unyanyembe in Mar., 1872, it was his intention to remain in Africa only about a year longer, and then to return to England for permanent residence. In the following Aug., having received men and supplies from Zanzibar, he led an expedition toward the e. side of lake Bangweolo and the supposed sources of the streams which form the Lualaba. From this time no news of his explorations was received from his own hand, and accurate details of this last journey are entirely wanting. An expedition, under the auspices of the royal geographical society, and commanded by lieut. Cameron, was sent to the relief of the explorer early in 1873. Leaving Zanzibar on Mar. 18, this relief-party began its quest. Having reached Unyanyembe in Aug., lieut. Cameron first heard of Livingstone's death. On Oct. 16 the intelligence was confirmed by the arrival there of a body of natives bearing the remains of the explorer, and bringing a letter from his negro servant, Wainwright. It appeared that the explorer, after enduring great hardships, had been attacked with dysentery, from which he died after a fortnight's illness. The party in charge of his remains encountered great difficulties and endured much suffering, but by the aid of lieut. Cameron they succeeded in reaching the coast. *The Last Journals of David Livingstone, including his Wanderings and Discoveries in Eastern Africa from* 1865 *to within a few days of his Death*, in 2 vols., edited by the Rev. Horace Waller, appeared in London in 1874; and *The Personal Life of David Livingstone, LL.D., D.C.L.; chiefly from his Unpublished Journals and Correspondence in the Possession of his Family;* by William Garden Blaikie, D.D., LL.D., was published in London in 1879. Both these works have been republished in New York. Dr. Livingstone was the recipient of honors from most of the geographical societies of the world; the academy of sciences in Paris elected him a corresponding member, and in 1871 the British government granted to his family a pension of £300. See AFRICA.

LIVINGSTONE RIVER. See CONGO, *ante*.

LIVINGSTONIA MISSION, of which the chief settlement is at cape Maclear at the s. end of lake Nyassa (q.v.), was based on a suggestion made by Dr. Livingstone that this lake was the best position for the establishment of a mission with a view to the annihilation of the Portuguese and Arab slave-trade on the e. of Africa. Acting on this suggestion, an expedition, costing about £6,000, was equipped in 1875 by the Scotch Presbyterian churches for establishing a mission here. Another station called Blantyre has been planted in the Shiré highlands, within easy distance of the lake. As yet the chief

industries are iron manufacture, basket-making, and cloth manufacture from the bark of trees and cotton. With the exception of the 70 m. of the Murchison falls, there exists unbroken water communication between the head of Nyassa and the Indian ocean.

LIVIUS, TITUS, the most illustrious of Roman historians, was b. at Patavium (Padua), in 61 B.C. according to Cato, but according to Varro in 59 B.C., the year of the great Cæsar's first consulship. We know nothing of his early life, except that he practiced as a rhetorician and wrote on rhetoric. There is internal evidence which makes it probable that he did not commence his great history till he was drawing near middle age. He lived to see his eightieth year; and having been born under the republic, died under Tiberius. His fame was so thoroughly established and widely spread, even during his lifetime, that a Spaniard traveled from Gades to Rome only to see him. Quintilian, in claiming for the Romans equal merit in the department of history with the Greeks, compares Livius to Herodotus, and there is no doubt that his countrymen regarded him as their greatest historical writer. The story that Asinius Pollio pretended to discover a certain provincialism or *patavinity* in his style is probably false; but even if it be true, modern criticism is unable to discover in what the peculiarity consisted; for Livius's work is one of the greatest masterpieces of Latin or of human composition. Originally the Roman history of Livius was comprised in 142 books, divided into *tens* or *decades;* but only 30 books, with the greater part of 5 more, now exist. Instead of a complete narrative from the foundation of the city to the historian's own time, we have detailed portions, the most valuable of which are the first decade, containing the early history, and the third, containing the wars with Hannibal. Among the surviving fragments of what is lost is a character of Cicero, preserved in the *Suasoria* of Seneca, the execution of which makes us deeply regret that time has not spared Livius's account of the transactions of his own period.

In classing Livius in his proper place among the great historians of the ancient and modern world, we must not think of him as a critical or antiquarian writer—a writer of scrupulously calm judgment and diligent research. He is pre-eminently a man of beautiful genius, with an unrivaled talent for narration, who takes up the history of his country in the spirit of an artist, and makes a free use of the materials lying handiest for the creation of a work full of grace, color, harmony, and a dignified ease. Prof. Ramsay has remarked that he treats the old tribunes just as if they were on a level with the demagogues of the worst period; and Niebuhr censures the errors of the same kind into which his Pompeian and aristocratic prepossessions betrayed him. But this tendency, if it was ever harmful, is harmless now, and was closely connected with that love of ancient Roman institutions and ancient Roman times which at once inspired his genius and was a part of it. And the value of his history is incalculable, even in the mutilated state in which we have it, as a picture of what the great Roman traditions were to the Romans in their most cultivated period. The literary talent most conspicuous in Livius is that of a narrator, and the English reader perhaps derives the best idea—though it is but a faint one—of his quality from the histories of Goldsmith or the *Tales of a Grandfather* of sir Walter Scott. He does not rival Tacitus in portraiture or in tragic power, but no writer has ever surpassed him in the art of telling a story; and the speeches which, according to the antique fashion, he puts into the mouths of his historic characters are singularly ingenious, pointed, and dramatically real. There is also something in a high degree winning and engaging about what we may call the moral atmosphere of Livius's history, which nobody can read without feeling that the historian had a kindly tender disposition—a large, candid, and generous soul. The *editio princeps* of Livius, which did not contain all that we now have of the work, was published at Rome about 1469, and MSS. of parts of Livius were existing in that century which have since disappeared. The most celebrated editions are those of Gronovius, Crevier, Drakenborch, and Ruddiman; and, in recent times, esteemed recensions of the text have been issued by Madvig, Alschefski, and Weissenborn.

LIV'IUS ANDRONI'CUS, the father of Roman dramatic and epic poetry, was a Greek by birth, probably a native of Tarentum, and flourished about the middle of the 3d c. B.C. He translated the Odyssey into Latin Saturnian verse, and wrote tragedies, comedies, and hymns after Greek models. Mere fragments are extant, of which a collection may be found in Bothe's *Poetæ scenici Latini* (vol. 5, Halberst, 1823) and Düntzer's *Livii Andronici Fragmenta Collecta et Illustrata* (Berlin, 1835).

LIV'NY, an ancient district t. of Great Russia, in the government of Orel, in lat. 52° 25′ n., long. 37° 37′ east. Pop. '67, 13,470, who carry on an extensive trade in corn, cattle, and honey.

LIVO'NIA (Ger. *Lievland*), one of the three Baltic provinces of Russia, to which belong also the islands of Oesel, Man, and Runo, contains an area of 18,088 sq.m., with a pop. of (1870) 1,000,876. The country is mostly flat, and one-fourth of it is covered with wood. The soil is only of moderate fertility; but nevertheless agriculture and cattle and sheep breeding are brought to a high degree of perfection. Livonia has many extensive factories and distilleries belonging to the government, also some cloth manufactories, one of which, situated near Pernau, is very extensive. The inhabitants of the country are

of Finnish and Lettish descent; those in the towns are chiefly Germans, with a sprinkling of Russians, Poles, and Jews. Livonia, up to the 17th c., included the three Baltic provinces of Courland, Livonia, and Esthonia.

LIVORNO. See LEGHORN.

LIVRE, the name of an ancient French coin, derived from the Roman *libra,* or *as* (q.v.). There were livres of different values, the most important being the *livre Tournois* (of Tours), which was considered the standard, and the *livre Parisis* (of Paris), which was equal to five-fourths of a livre Tournois. In 1795 the livre was superseded by the franc (80 francs = 81 livres Tournois).—LIVRE was also the ancient French unit of weight, and was equal to 17.267 oz. avoirdupois; the kilogram (see GRAM) has taken its place.

LIVY. See LIVIUS, *ante.*

LIXIVIATION (Lat. *lix,* ashes), a term employed in chemistry to denote the process of washing or steeping certain substances in a fluid, for the purpose of dissolving a portion of their ingredients, and so separating them from the insoluble residue. Thus, wood-ash is lixiviated with water to dissolve out the carbonates of soda and potash from the insoluble parts. The solution thus obtained is called a *lixivium* or *lye.*

LIXU'RI, a t. of the island of Cephalonia, on the w. shore of the gulf of Argostoli. It is a Greek bishop's see. Pop. 7,000.

LIZARD, *Lacerta,* a genus of saurian reptiles, the type of a numerous group, in which monitors (q.v.), etc., are included, and to which the *megalosaurus* and other large fossil saurians are referred. The name lizard is indeed often extended to all the saurian reptiles; but in its more restricted sense it is applied only to a family, *lacertidæ,* none of which attain a large size, whilst most of them are small, active, brilliantly colored, and bright-eyed creatures, loving warmth and sunshine, abounding chiefly in the warmer parts of the old world. They have a long, extensile, forked tongue; the body is generally long, and terminates in a rather long tail; the feet have each five toes, furnished with claws; the upper parts are covered with small, imbricated scales; the scales of the under parts are larger; a collar of broad scales surrounds the neck; the bones of the skull advance over the temples and orbits; the back part of the palate is armed with two rows of teeth. They feed chiefly on insects. Britain produces only two well-ascertained species: the SAND LIZARD (*L. agilis* or *L. stirpium*), about 7 in. long, variable in color and marking, but generally sandy brown on the upper parts, blotched with darker brown, and having a lateral series of black, rounded spots, each of which has a yellowish-white dot or line in the center; and the COMMON LIZARD, or VIVIPAROUS LIZARD (*zootoca vivipara*), smaller, more slender, very variable in color, a dark-brown generally prevailing on the upper parts. The former species is comparatively rare; it inhabits sandy heaths: the latter is abundant in dry moors and sand-banks. They differ remarkably in the former being oviparous, the latter viviparous, or, more strictly speaking, ovoviviparous. Both are harmless creatures, as are all the rest of this family. Larger species are found in the more southern parts of Europe. Some of the lizards are quite susceptible of being tamed. They are remarkable for the readiness with which the end of the tail breaks off; the flinging of a glove or handkerchief on one when it is trying to make its escape is often enough to cause the separation of this portion, which lies wriggling whilst the animal hastens away. The lost portion is afterwards reproduced. Lizards become torpid in winter.

LIZARD, in heraldry, means either (1) the reptile usually so called or (2) a beast somewhat resembling the wild-cat, and said to be found in several countries of northern Europe, represented with brown fur and large spots of a darker shade.

LIZARD POINT. See CORNWALL.

LIZARD'S TAIL, the *saururus cernuus* (Lin.), of the natural order *sauraceæ,* a perennial plant growing in marshes and along the edges of ponds and slow streams in New York and westward and northward. Its stem is about 2 ft. high and rather weak; leaves alternate, petiolate, heart-shaped, entire, pointed, convergingly ribbed, slightly hairy, and pale green underneath. The flowers are in a slender, crowded, terminal, spike-like, gracefully curved raceme, about 4 in. long, having no calyx or corolla, the pistils, 6 or 7 in number, standing in the axis of a bract. Fruit rather fleshy, wrinkled, and composed of three to four pistils united at the base. The entire plant has an aromatic but rather unpleasant odor and a somewhat acrid taste. The root has been used for making poultices for abscesses and other painful swellings.

LLAMA, *Auchenia lama,* a most useful South American quadruped of the family *camelidæ.* It is doubtful whether it ought to be regarded as a distinct species, or as a mere domesticated variety of the huanaca (q.v.). It was in general use as a beast of burden on the Peruvian Andes at the time of the Spanish conquest, and was the only beast of burden used by the natives of America before the horse and ass were introduced by Europeans. It is still much used in this capacity on the Andes, the peculiar conformation of its feet (see AUCHENIA) enabling it to walk securely on slopes too rough and steep for any other animal. The working of many of the silver mines of the Andes could scarcely be carried on but for the assistance of llamas. The burden carried by the

llama should not exceed 125 pounds. When too heavily loaded the animal lies down and refuses to move, nor will either coaxing or severity overcome its resolution. It is generally very patient and docile. Its rate of traveling is about 12 or 15 m. a day. The llama is about 3 ft. in height at the shoulder, has a longish neck, and carries its head elevated. The females are smaller and less strong than the males, which alone are used for carrying burdens. The color is very various, generally brown with shades of yellow or black, frequently speckled, rarely quite white or black. The flesh is spongy, coarse, and not of a very agreeable flavor. The hair or wool is inferior to that of the alpaca, but is used for similar purposes; that of the female is finer than that of the male. The llama has been introduced with the alpaca into Australia; but it is only for steep mountain regions that it seems to be adapted.

LLANDAFF (*llan Taff*, the place of a church on the Taff), a city of s. Wales, in the co. of Glamorgan, is situated on the right bank of the Taff, 3 m. above Cardiff, in a district remarkable for its beauty. It is the seat of a bishopric, the revenue of which is £4,200. Pop. about 700.

LLANDUD'NO, a very fashionable watering-place in the co. of Caernarvon, n. Wales, is situated between the Great and Little Orme's Heads, 40 m. w.s.w. of Liverpool. The air is described as "delicious," and there is every facility for sea-bathing, and extensive healthy rambles. Pop. in '71, 2,762.

LLANEL'LY, a parliamentary borough, manufacturing town, and seaport of s. Wales, in the co. of Caermarthen, and 16 m. s.e. of the t. of that name. The mineral wealth of the vicinity, and the easy access to the sea, have raised the town to considerable commercial importance. The Cambrian copper-works employ a great number of the inhabitants; but there are also silver-, lead-, iron-, and tin-works, and a pottery. Coal is largely exported. In 1877, 2,935 vessels, of 207,251 tons, entered and cleared the port. Pop. of parliamentary borough in 1871, 15,281.

LLANGOL'LEN, a small t. of n. Wales, in the co. of Denbigh, picturesquely situated on the right bank of the river Dee, 22 m. s.w. of Chester. It is visited by tourists on account of the beauty of the famous vale of Llangollen, and for its antiquities, among which is the fragment of the round inscribed pillar of Elisy.

LLAN'IDLOES, a municipal and parliamentary borough of n. Wales, in the co. of Montgomery, 19 m. w.s.w. of the t. of that name. Its church is one of the most beautiful in Wales. Considerable manufactures of flannel and other woolen fabrics are carried on. Llanidloes unites with several other boroughs in sending a member to parliament. Pop. '71, 3,428.

LLA'NO, a w. central co. in Texas; bounded by the Colorado, and intersected by the Llano and its affluents; 900 sq.m.; pop. '70, 1379. It is arid and stony the inhabitants being devoted chiefly to stock-raising. The minerals abound, including gold, lead, iron, silver, and antimony. Salt and building-stone also are found. Co. seat, Llano.

LLA'NO ESTACA'DO, a desolate plateau of n.w. Texas and s.e. New Mexico, having an area of more than 40,000 sq.m., and an elevation of from 3,200 to 4,700 ft., with a general slope northward. It has but a scanty supply of water, and is covered with a sparse coating of grass in the wet season. Its scanty shrubs have large roots, which are used for fuel. Attempts made by gen. Pope in 1852 to obtain water by means of artesian wells met with little success.

LLA'NOS are vast steppes or plains in the northern portion of South America, partly covered with tall luxuriant grass, and partly with drifting sand, and stocked with innumerable herds of cattle. They resemble the more southern pampas (q.v.) and the North American savannas (q.v.). The inhabitants, a vigorous race of shepherds, are called llaneros.

LLAN'QUIHUE, a district of the department of Valdivia in southern Chili, between the river Buena on the north and the gulf of Ancud; 8,350 sq.m.; pop. about 43,000. It is mostly a fertile plain drained by the river Maullin, and largely peopled by Germans engaged in agriculture and grazing. The climate resembles that of Ireland, though the winters are less severe. It is the favorite part of Chili with emigrants from Europe, because more nearly resembling the northern coast of Europe in soil, production, and climate than other portions of Chili. Three volcanoes are among the Andes upon its eastern side. Port Montt, on the gulf of Ancud, is the principal town.

LLERE'NA, a t. in the Spanish province of Badajoz, and 63 m. s.e. of Badajoz. The inhabitants are mostly employed in agriculture. Pop. 6,000. Near Llerena lord Combermere with his cavalry routed, on April 11, 1812, a French force of 2,500 cavalry and 10,000 infantry, the rearguard of Soult, under Drouet, retiring after the capture of Badajoz.

LLEWELL'YN AP GRIFFITH, Prince of Wales, d. 1282. He succeeded David, 1246; revolted from his allegiance to the English in 1256, but made peace with Henry III. in 1268. Edward I. summoned him to attend parliament at Westminster both in 1274 and 1276, but he refused to appear. His wife, Eleanor de Montfort, was captured by the English in the channel in 1275, and his offers of a ransom for her were declined. The English invaded his territory and were successfully repelled; but in 1277 he surren-

dered his domains and was taken to Westminster. He subsequently returned to Wales, and, after being reconciled to his brother David, renewed the war with the English. He was surprised and killed by Mortimer in 1282.

LLORENTE, JUAN ANTONIO, a Spanish historian, was b. at Rincon del Soto, near Calahorra, Mar. 30, 1760. He was educated by his maternal uncle, and received orders in 1779. He took his degree in canon law, and was named successively advocate of the council of Castile in 1781, vicar-general of Calahorra (1782), and finally secretary of the inquisition in 1789. Llorente was from an early period attached to the liberal party. On the fall of Jovellanos he was deprived of his employments, and remained in disgrace till 1805, when he recovered favor as the reward of a literary service of a very questionable character which he rendered to Godoy, by a historical essay against the liberties of the Basque provinces. On the intrusion of the Napoleon dynasty Llorente became a zealous partisan of the French, and an active instrument of the French policy, to which he lent all his support at the press, as well as in office; and being obliged to fly, on the restoration of Ferdinand, he fixed his residence in Paris, where he published the work to which his celebrity is chiefly due—his *Critical History of the Inquisition.* This work, which professes to be founded on authentic documents, although throwing much light on a subject previously inaccessible, has, in the judgment of impartial historians, as Prescott, Ranke, and others, lost most of its value by its plainly partisan character, and by the exaggerations in which it abounds. See INQUISITION. Written by Llorente in Spanish, it was translated into French, under the author's eye, by Alexis Pellier (Par. 1817–18), and has been translated into most of the European languages. Llorente published, during his residence in Paris, several other works, some literary, as his *Critical Observations on Gil Blas;* some polemical, as his *Portraits Politiques des Papes;* and others, it is alleged, of a more questionable character in a moral point of view. His work on the popes led to his being compelled to quit Paris in 1822, and a few days after he reached Madrid he died, Feb. 5, 1823. He was also the author of *Memoirs of the Spanish Revolution,* 3 vols. 8vo, 1819, and an *Essay on a Religious Constitution,* 1819. Most of his works were published both in Spanish and in French.

LLOYD, THOMAS, 1649–94; b. at Dolobran, north Wales; educated at Oxford, but was converted to Quakerism, and, as a preacher of that sect, suffered much persecution; in 1684 accompanied William Penn to America, and was acting-governor and president of the council of Pennsylvania, 1684–86, and deputy-governor, 1691–93.

LLOYD, WILLIAM, D.D., 1627–1717; bishop of Worcester; b. Tilehurst, Berkshire; educated at Oriel college, Oxford; became fellow of Jesus college in 1646; ordained deacon in 1648; was tutor in a gentleman's family; rector of Bradwell in 1654; ordained priest in 1665, and made chaplain to Charles II.; received the title of doctor of divinity in 1667. Passing through several of the lower grades of church preferment he was made dean of Bangor in 1672, bishop of Exeter in 1676, and of St. Asaph in 1680. He took an active part in the troubles between the Romanists and Protestants in 1678. In 1688 he, with six other bishops, presented a protest to the king against the publication of his declaration of indulgence to Romanists and dissenters, and was with the others soon after imprisoned in the Tower. When tried they were acquitted. He was a warm supporter of the revolution, and was appointed almoner to William and Mary soon after their arrival in England. In 1692 he was transferred to the see of Coventry, and promoted in 1699 to the bishopric of Worcester. He furnished valuable materials to bishop Burnet's *History of His Own Times,* and besides many pamphlets on the Roman Catholic controversy, a few tracts on ecclesiastical subjects and several sermons, published *A Chronological Account of the Life of Pythagoras and of his famous Contemporaries; A Dissertation on Daniel's Seventy Weeks;* and *A System of Chronology.*

LLOYD'S, a set of rooms on the first floor of the royal exchange, London, frequented by merchants, ship-owners, underwriters, etc., for the purpose of obtaining shipping intelligence, and transacting marine insurances. One large room, with small rooms attached to it, is set apart for the use of the *underwriters,* and there two enormous ledgers lie constantly open, the one containing a list of vessels *arrived,* the other recording disasters at sea. In the same series of rooms there is a self-registering anemometer and anemoscope for the use of the underwriters; also a valuable collection of charts for consultation. See INSURANCE, MARINE. The extent of business transacted here may be imagined when we consider that the value annually insured amounts to above £40,000,000. None but members of Lloyd's, who have duly paid the fees, are allowed to transact business there either as insurance-brokers or underwriters. The shipping intelligence is furnished by agents appointed for the purpose, and there is scarcely a port of consequence where one is not stationed. The agent receives no salary, his labor being amply compensated by the advantages he derives from the connection. The intelligence contained in the ledgers is also diffused over the country every afternoon by the publication of *Lloyd's List.* There are two other rooms—the *reading room,* which is merely an extensive news-room; and the *captains' room,* where auctions of ships are carried on, and where captains and merchants can meet together in a sociable manner. The society of Lloyd's is managed by a committee of twelve, selected from among the members, who also appoint the agents and officials of the establishment. The expenses are defrayed by fees and annual subscriptions.

Lloyd's Register of British and Foreign Shipping is a volume published annually, and containing information respecting vessels, their age, materials, repairs, owners, captains, etc. This information is supplied by salaried agents at the different ports. The office of the *Register* is quite distinct from Lloyd's of the exchange.

The name *Lloyd's*, which is now generically applied, arose from the circumstance that the head-quarters of the London underwriters was originally Lloyd's coffee-house. See Martin's *History of Lloyd's*, 1876.

LLOYD'S, AUSTRIAN, an association for general, commercial, and industrial purposes, was founded in Trieste by baron Bruck in 1833, to supply the want, experienced by the maritime insurance companies of that port, of a central administration to attend to their common interests. This association, like its London prototype, has agents in all the principal foreign ports, whose duty it is to collect all information of a nature to affect the commerce and navigation of Trieste, and to keep a list of all entrances and clearances of ships at their respective ports. This information is published in the *Giornale del Lloyd Austriaco*. This company has established regular communication between Trieste and all the important seaports in the Adriatic and Levant, by means of a large fleet of steamers, which also carry the Austrian mails. The society of Austrian Lloyd's includes three sections: the first is composed of insurance companies, the second of steamboat companies, while the third or scientific department (established in 1849) has a printing-press, an engraving-room, and an artistic establishment for the perfecting of engraving on copper and steel. This last section has issued a great number of literary and scientific journals.

LLOYD'S BONDS, the name given to a species of securities introduced by Mr. John Horatio Lloyd, the eminent barrister, and much employed by railway and other companies, whose power of borrowing money on mortgage or bond is derived from and limited by acts of parliament. A Lloyd's bond is an admission under seal of a debt being due by the company issuing the bond to the person in whose favor it is executed, with a covenant to pay the sum due at a time fixed, and to pay interest at a certain rate from the time of issue until payment. The covenant is made by the company, their successors and assigns, with the obligee, his executors and administrators; so that a Lloyd's bond on the face of it is not assignable, and is not, properly speaking, a negotiable instrument. The value of it consists in its converting a simple contract or ordinary debt into a specialty debt, by which the holder gains a preference over ordinary creditors; and in its enabling the holder, armed with this preference, to raise money upon the faith of the debt, either by assigning his interest in it, or by depositing the bond as a security for advances. A valid Lloyd's bond, as a security, appears to be inferior to a debenture issued under statutory authority in no respect except that its validity can be put in question.

As railway and other companies which have come into existence under parliamentary authority have no powers except those which parliament has conferred upon them, their power of borrowing is limited to the amounts and must be exercised in the manner which parliament has prescribed. By the act 7 and 8 Vict. c. 85, s. 19, it is declared illegal for them to grant any loan-notes, or other negotiable or assignable instrument, in security of money advanced, except so far as they are authorized by statute. In general, they have statutory authority to borrow only when a certain portion (usually the whole) of their capital has been subscribed, and a certain portion of it has been paid up. And the statute 8 and 9 Vict. c. 16 (the companies' clauses consolidation act) provides that their power of borrowing must be exercised under the authority of a general meeting. Previous to the introduction of Lloyd's bonds, these restrictions upon borrowing really limited the liabilities of companies. They were severely felt by companies whose works were being made or being extended; which often were in need of money, which it was impossible or impolitic to raise by means of calls, and whose borrowing powers had not come into operation, or could not conveniently be resorted to. Mr. Lloyd relieved such companies from their difficulties, and to a certain extent defeated the intentions of parliament by taking advantage of the fact that companies, if they were prevented from borrowing, were not prohibited from getting into debt in any other way, and granting acknowledgments of their indebtedness in any form except perhaps that of a negotiable instrument. For work done, for goods delivered, for anything except money advanced, the directors of a company might grant admissions of indebtedness; and Mr. Lloyd supplied a form in which such admissions would become almost as binding on a company as a statutory debenture, in which they could be sufficiently marketable, in which they could be conveniently granted by directors on account of all the important objects for the sake of which they could desire to borrow to any extent, without the sanction of a general meeting of the shareholders. The only drawback upon the usefulness (for their purpose) of Lloyd's bonds has been, that they have only been negotiable at high rates of discount; but this has not prevented companies from using them, in many cases to a dangerous extent. There are instances in which lines have been, for the most part, made by means of Lloyd's bonds; and they have constantly been used simply as a colorable means of eluding the statutory restrictions upon borrowing. On the other hand, they have been of considerable service to companies in the first period of their existence; and that, on the whole, they are thought to have been useful may perhaps be inferred from their implied

recognition by statute; the regulation of railways act, 1868 (section 3, sched. i., No. 13), directing the amount due on "Lloyd's bond and other obligations not included in the loan capital statement," to be set forth as an item in the "general balance sheet," which, under this act, every company requires to prepare half-yearly.

It results, from what has been stated, that a Lloyd's bond cannot be granted for money lent, but can be granted for any other antecedent debt. It cannot be granted for money lent, though the money has actually been used in paying off debts for which bonds might have been granted. The bond should state the origin of the debt on account of which it is granted, but this is not essential. The courts will in no case assume that a Lloyd's bond has been issued in breach of statutory provisions; but evidence of an intention to defeat such provisions will invalidate a bond. If there have been no actual debt (as may happen when a company's accounts with a contractor are unsettled), the instrument will not create one; and in that case, the obligee or holder will not be able to recover, even though the obligee *bonâ fide* believed that a debt existed. Directors are not personally responsible upon a Lloyd's bond improperly issued. The leading case upon this subject is that of Chambers *v.* the Manchester and Milford-Haven railway company (5 Best and Smith's Rep., 588), decided by the court of queen's bench in June, 1864. A review of the whole series of cases on this subject up to the date of the decision will be found in the case of *In re* Bagnalstown and Wexford railway company, 1870 (Irish Reports, 4 Eq. 505). The form of this instrument (which must be duly stamped) is as follows: "The A. and B. railway company do hereby acknowledge that they stand indebted to C. D. in the sum of £1000 for money due and owing from the said company to the said C. D., in respect of work and labor done for the said company by the said C. D. And the said company for themselves, their successors and assigns, hereby covenant with the said C. D., his executors and administrators, to pay to him, his executors, administrators, and assigns, the said sum of £1000 upon the 1st day of May, 1869, and also interest thereon at the rate of 5 per cent per annum from the date hereof until payment; such interest to be payable half-yearly, on the 1st day of January, and the 1st day of July in each year.—Given under the common seal of the said company, the 1st day of May, 1866.—X. Y., *Secretary.*"

LLUMAYOR', or LLUCH-MAYOR, a t. of the island of Majorca, in an inland situation, among mountains, 15 m. s.e. from Palma. It has manufactures of linen and woolen fabrics. Wine and brandy are also produced. Pop. 7,000.

LOACH, *Cobitis*, a genus of fishes of the family *cyprinidæ*, having an elongated body, covered with small scales, and invested with a thick mucous secretion; a small head, a small toothless mouth surrounded with 4 to 10 barbules; small gill-openings, and three branchiostegous rays. One species, the COMMON LOACH (*C. barbatula*), called in Scotland the *beardie*, is common in rivers and brooks in Britain. It seldom exceeds 4 inches in length; is yellowish-white, clouded, and spotted with brown; feeds on worms and aquatic insects; and is highly esteemed for the table. It generally keeps very close to the bottom of the water.—The LAKE LOACH (*C. fossilis*) of the continent of Europe, is sometimes a foot long, with longitudinal stripes of brown and yellow. It inhabits the mud of stagnant waters, coming to the surface only in stormy weather. The flesh is soft and has a muddy flavor.

LOADSTONE, or MAGNETIC IRON ORE, a mineral consisting of a mixture of peroxide of iron and protoxide of iron; sometimes occurring in grains, as *iron sand*, in trap rocks, sometimes in beds in primitive rocks, as in Scandinavia, where it is a valuable ore of iron. It is remarkable for its highly magnetic quality; and indeed magnetism was first known as belonging to it. It is of a black color; and occurs in concretions, and crystallized in octahedrons and rhomboidal dodecahedrons.

LOAM (Ger. *Lehm*, allied to Lat. *limus*, mud, and to *lime*, *slime*), a term much employed by agriculturists and others to designate a soil consisting of a mixture of clay, sand, and lime, with animal and vegetable matters in a state of intimate mixture. The clay varies from 20 to 50 per cent; the proportion of lime is generally not more than 5 per cent. Loamy soils are among the best and most fertile of soils. They are not stiff and tenacious like clay soils, and they are much more fertile than sandy soils. Even in mere *mechanical* properties, they are superior to both. The "clay" used for making bricks is often really a loam in which the proportion of true clay is large. In Italy, France, and other countries, walls are made of loam beaten down between planks placed at the requisite width; and these walls become very solid, and last for centuries.

LOAN, in law (LOAN OF MONEY, *ante*), signifies either the delivery of money or any personal chattel by one person to another for which an equivalent return is to be made; or the bailment of a personal chattel to be returned in kind. In the case of the loan first mentioned, if the thing loaned be other than money, and its equivalent be not returned to the lender, he may recover its value with interest, if so specified, and costs, in a suit at law. But the specific article itself cannot be recovered at law, since the award of damages offers the lender, as a rule, a sufficient remedy. Yet equity will sometimes enforce specific performance of such a contract. But equity will not enforce, for instance, a contract for the delivery of a stock of which shares are easily procurable. The most ordinary contract of loan for which an equivalent is to be returned is a loan

for money. This loan makes the parties to it debtor and creditor, instead of bailor and bailee. If there have been no express contract of loan, the law will imply one, with interest to be computed from the time the loan was made. The second class of loans belongs to the class of gratuitous bailments, the delivery of an article to the bailee, for his use, without compensation, and on condition of its return to the bailor. As this kind of bailment is entirely to the advantage of the bailee, he is bound to use extraordinary care, and is responsible for slight negligence, in the use of the bailment. He is not responsible for the natural deterioration by ordinary wear and tear of the article delivered, but with that exception must return the article to the bailor in as good condition as when it was received. The diligence to which the bailee is held in the care of the property depends upon its character and value, and the circumstances to which it is exposed. If the bailee refuse to deliver the property when the bailment has expired, after demand made, he may be sued in trover or replevin.

LOAN ASSOCIATION, BUILDING. See CO-OPERATION.

LOAN'DA, ST. PAUL DE. See SAINT PAUL DE LOANDA, *ante*.

LOAN'GO, a maritime kingdom of s.w. Africa, extends on the coast from cape Lopez, in lat. 0° 44′ s., to the river Congo or Zaire, which separates it on the s. from the country of Congo. Forests cover a great portion of the country, which is mountainous toward the s.e. On the coast the surface is level and fertile; the interior is not yet well known. Formerly, the chief trade was in slaves; ivory and wax now form the chief exports. The inhabitants are skillful in the manufacture of baskets, variously dyed mats, grass-cloth, wooden spoons, figures, etc. At the town of Kabinda, near the n. bank of the Congo (pop. from 10,000 to 18,000), boats and canoes, the former almost equal to those of English make, are built. Trade is free to all nations. The king is considered a divinity, and the government is an absolute despotism. Polygamy prevails, and a man's wives are, at his death, handed down by inheritance, like the rest of his goods. The religion is an idolatrous superstition. Loango, the chief town, is situated 130 m. n. of the mouth of the Congo river, near the coast. The pop., including the villages in the vicinity, amounts to about 20,000.

LOAN OF MONEY is an implied contract, by which B, the borrower, agrees to pay L, the lender. There are various modes by which B gives an acknowledgment for a loan, as by giving a bond or a promissory note, or I O U (q.v.), the last of which requires no stamp. But no writing is necessary to constitute the contract, which may be proved by parole, and often is proved by the lender's oath, confirmed by circumstantial evidence or letters of the borrower. The debt must in general be sued for in six years in England and Ireland. In Scotland, a borrower is much more favored, for there are only two ways of proving the loan if it exceeds £8 6s. 8d., viz., by some writing of the borrower, or by staking the truth as to whether the money is really due on the borrower's oath. Hence, if a hundred witnesses saw the loan advanced, but there was no writing, or the borrower, when put to it, denied it on oath, he can escape liability entirely.

LOASA'CEÆ, a natural order of exogenous plants, natives of America, and chiefly from the temperate and warmer parts of it. There are about seventy known species, herbaceous plants, hispid with stinging hairs. They have opposite or alternate leaves, without stipules, and axillary 1-flowered peduncles. The calyx is 4 to 5 parted; the petals 5, or, by an additional inner row, 10; often hooded. The stamens are numerous, in several rows, sometimes in bundles. The ovary is inferior, 1-celled; the fruit capsular or succulent.—Some of the species are frequently to be seen in hot-houses and flower-gardens. The genus *loasa* sometimes receives the popular name of CHILI NETTLE.

LOBAU, an island about 5 m. below Vienna, in the Danube; is noted for its connection with the battle of Aspern, between Napoleon I. and the Austrians under archduke Charles, May 21–2, 1809. Napoleon connected it by bridges with both banks, and crossed to the left bank on the 21st. On the night of the 22d, the defeated French regained the island and held it until July 4, when the river was again crossed and the battle of Wagram won on July 6. The title count Lobau was bestowed on gen. Mouton for conduct in the first attempt.

LÖ'BAU, a t. of Saxony, 40 m. e. of Dresden. Near it are mineral springs and bathing establishments. It has tanneries, mills, and bleaching-fields. In the ancient *Rathhaus,* the deputies of the six towns of Lusatia met from 1310 to 1814. "Lobau diamonds" are crystals found here. Pop. '75, 6,226.

LOBAU, GEORGES MOUTON, Comte de, 1770–1838; b. France. A favorite and impetuous soldier in the campaigns of Napoleon, and by him made count of Lobau, in compliment for his valuable service in the Austrian campaign of 1809. He was taken by the English at Waterloo; returned to France in 1818; and was in obscurity until the revolution of 1830, when on the resignation of Lafayette he was made commanding general of the national guard of Paris. He distinguished himself at this time by suppressing a series of gatherings on the streets of Paris intended to organize a revolution in favor of the Bonaparte dynasty, by deluging the mob with water from fire-engines. The success of the experiment was the theme of innumerable caricatures.

LOBEIRA, or LOVEIRA, VASCO DE, a Portuguese writer of the 14th c.; d. 1404. Educated to the profession of arms, he was eminent only as the author or supposed author of a romance that has survived the centuries, and which appeared under the title of *Los quatros libros del Cavallero Amadis de Gaula.* It is known in the French translation as *L'Amadis de Gaul.*

LOBEL, or DE L'OBEL, MATTHIAS, 1538–1616; b. Lille, France; educated as a physician. He traveled through Europe, and was at one time physician to William of Orange; afterwards given a position as botanist in England under James I. He was a close student of vegetable physiology, making new classifications by means of evident analogies of growth. The class of plants called *Lobelia* was named in compliment to him. He was author of *Stirpium Adversaria Nova,* London, 1570; *Plantarum seu Stirpium Historia,* Antwerp, 1576; and *Icones Stirpium,* Antwerp, 1581.

LOBE'LIA, a genus of exogenous plants of the natural order *lobeliaceæ.* This order is nearly allied to *campanulaceæ,* one of the most conspicuous differences being the irregular corolla. It contains almost 400 known species, natives of tropical and temperate climates, abounding chiefly in damp woods in America and the n. of India. They are generally herbaceous or half-shrubby, and have a milky juice, which is often very acrid, and often contains much caoutchouc. A poisonous character belongs to the order, and some are excessively acrid, as *tupa fuillei,* a Chilian and Peruvian plant, of which the very smell excites vomiting; yet the succulent fruit of one species, *centropogon surinamensis,* is eatable.—The genus *Lobelia* is the only one of this order of which any species are British. The WATER LOBELIA (*L. dortmanna*) is frequent in lakes with gravelly bottom, often forming a green carpet underneath the water with its densely matted, sub-cylindrical leaves. The flowers are blue, the flowering stems rising above the water.—To this genus belong many favorite garden flowers, as the beautiful CARDINAL FLOWERS (*L. cardinalis, L. fulgens,* and *L. splendens*) and the BLUE CARDINAL (*L. syphilitica*), natives of the warmer parts of North America, perennials, which it is usual to protect during winter in Britain. To this genus belongs also the INDIAN TOBACCO of North America (*L. inflata*), an annual, with an erect stem, a foot high or more, with blue flowers, which has been used as a medicine from time immemorial by the aborigines of North America, and was introduced into this country in 1829 by Dr. Reece. Both the flowering-herb and the seeds are imported. It is the former, compressed in oblong cakes, which is chiefly employed. The chemical constituents of Lobelia are not accurately known. A liquid alkaloid, *lobelina,* and a peculiar acid, to which the term *lobelic acid* has been applied, have been obtained from it.

In small doses, it acts as diaphoretic and expectorant; in full doses (as a scruple of the powdered herb), it acts as a powerful nauseating emetic; while in excessive doses, or in full doses, too often repeated, it is a powerful acro-narcotic poison. It is the favorite remedy of a special class of empirics, and consequently deaths from its administration are by no means rare. Physicians seldom prescribe it now, except in cases of asthma.

In a case of poisoning by this drug, the contents of the stomach should be withdrawn as speedily as possible. If the stomach pump is not at hand, an emetic of sulphate of zinc or of mustard should be administered.

LOBIPE'DIDÆ, a family of birds of the order *grallæ,* nearly allied to *rallidæ* (rails, crakes, gallinules, etc.), but differing in having the toes separately margined on both sides with a scolloped membrane, thus forming an interesting connecting link with the web-footed birds, or order *palmipedes.* The general appearance of many of the lobipedidæ also approaches to that of the *anatidæ.* Coots and phalaropes are examples of this family. They are all aquatic, some of them frequenting fresh, and others salt water; some often found far out at sea on banks of sea-weed.

LOBLOLLY BAY. See GORDONIA, *ante.*

LOBLOLLY-BOY, the name applied on board ship to the man who assists the medical officers in the "sick-bay," or hospital.

LOBO, JERONIMO, 1595–1678; b. Lisbon; joined the order of Jesuits in 1609; was made in 1621 professor in the Jesuits' college at Coimbra, but ordered to resign and repair as a missionary to India, embarked in 1622, and arrived in Goa the same year. In 1624 he left India and went to Abyssinia to Christianize that country, whose ruler had been converted to the Roman Catholic faith by father Paez in 1603. Disembarking on the coast of Mombas and vainly attempting to enter Abyssinia by land, he returned, and the next year, renewing the attempt, he landed on the coast of the Red sea with Mendez, the patriarch of Ethiopia, and eight missionaries, and reached Fremona, where was the missionary settlement. Here he remained for several years as superior of the missions in the state of Tigré, and was very successful. The death of the emperor Segued leaving the Roman Catholics without a protector, Lobo and all the Portuguese, numbering 400, with the patriarch, bishop, and 18 Jesuits, were expelled by his successor from the country. All fell into the hands of the Turks at Massowah, and Lobo was sent to India to procure a ransom for his imprisoned associates. He accomplished his object, but was unsuccessful in his endeavor to induce the Portuguese viceroy to send an army against Abyssinia. He then embarked for Portugal, was shipwrecked on the coast of

Natal and captured by pirates. Reaching Lisbon he was sent to Madrid, as Portugal was then under the king of Spain, and endeavored to enlist the government in his scheme to convert Abyssinia to the Roman church by force. But neither at Lisbon, Madrid, nor Paris did his plan meet with favor. He then set out for Rome to lay his favorite idea before the pope, but here also he received no encouragement. He returned to India in 1640, and became rector and afterwards provincial of the Jesuits at Goa. Returning to Lisbon in 1656 he engaged in literary pursuits, and in 1659 published the narrative of his journey to Abyssinia, entitled *Historia de Ethiopia*, which was translated into French by the abbé Legrand, who added a continuation of the Roman Catholic missions in Abyssinia after Lobo's departure, and an account of the expedition of Poncet, a French surgeon from Egypt. This is followed by some dissertations on the history, religion, government, etc., of Abyssinia. The whole was translated into English by Dr. Johnson in 1735. Lobo was remarkable for enterprise and perseverance.

LO'BOS ISLANDS, two small groups of rocky islands on the coast of Peru, famous for the great quantity of guano which they produce. The southern point of the northern group, *Lobos de Tierra*, is in s. lat. 6° 29′; the southern group, *Lobos de Affuera*, is 25 m. farther south. The northern group is about 12 m. from the mainland. The principal island of this group is about 5 m. long and 2 m. broad. The southern group consists chiefly of two islands separated by a narrow channel, the largest being about 2 m. long.

LOBSTER, *Homarus*, a genus of crustaceans of the order *decapoda*, suborder *macroura* (see CRAYFISH), differing from crayfish (*astacus*), to which, in general form and characters, they are very similar, in having the *rostrum* in front of the carapace not depressed but straight, and armed with many teeth on each side, and the last ring of the thorax not movable but soldered to the preceding one. The COMMON LOBSTER (*H. vulgaris*), found in great plenty on rocky coasts of Britain and most parts of Europe, is too well known to require description. It sometimes attains such a size as to weigh 12 or 14 lbs. when loaded with spawn, although a lobster of 1 lb. weight, or even less, is deemed very fit for the market. It is needless to say how highly the lobster is esteemed for the table. It is in best season from Oct. to the beginning of May. Its beautifully clouded and varied bluish-black color changes to a nearly uniform red in boiling. It is found in greatest abundance in clear water of no great depth, and displays great activity in retreating from danger, using its powerful tail-fin for swimming, or almost springing through the water and thrusting itself into holes of the rocks which seem almost too small to admit its body. The claws are powerful weapons of defense; one is always larger than the other, and the pincers of one claw are knobbed on the inner edge, those of the other are serrated. It is more dangerous to be seized by the serrated than by the knobbed claw. Lobsters are sometimes caught by the hand, which requires dexterity; but they are more frequently taken in traps of various kinds, sometimes made of osier twigs, sometimes a kind of nets, sometimes pots, but always baited with animal garbage. The supply of lobsters sent to market, chiefly to London, from the coasts of all parts of Britain has of late years greatly fallen off from over-fishing. Lobsters are very voracious; they are also very pugnacious, and have frequent combats among themselves, in which limbs are often lost; but the loss is soon repaired by the growth of a new limb, rather smaller than the old one. Like crabs, they frequently change their shelly covering, and for a short time before their molting are very languid and inert. Their growth takes place during the time when the shell is soft, and with extraordinary rapidity.—The AMERICAN LOBSTER (*H. Americanus*) has claws much larger in proportion than the common lobster.—The NORWAY LOBSTER (*nephrops Norvegicus*) is frequently taken on the British coasts, and appears in the markets. The eyes are kidney-shaped, and not round as in the common lobster. The claws have also a more slender and prismatic form, and the color is a pale flesh-color. It is said by some to be the most delicate of all the crustaceans; by others, to be inferior to the common lobster.—The SPINY LOBSTER, or SEA CRAYFISH (*palinurus vulgaris*), is not uncommon on the rocky coasts of Britain, particularly in the south. It is believed to be the *karabos* of the Greeks and the *locusta* of the Romans. It attains a length of about 18 inches. The shell is very hard, and the whole body is rough with short spines. The antennæ are very long, much longer than those of the common lobster. There are no claws or pincers, the first pair of feet being very similar to the others. The spiny lobster is brought to market in London and elsewhere, but is inferior to the common lobster.—Other species of these genera are found in other parts of the world.

LOBSTER (*ante*). A mere inspection will show that a lobster is composed of two principal parts. These are commonly called the head and the tail. That which is called the head is really the head and the thorax combined, and is technically called the cephalothorax; while the part called the tail is the abdomen. Like all annulosa (articulata), the lobster is composed of a number of annular segments, or parts representing such, with members—legs, jaws, claws, feelers, etc.—attached to them, the whole being inclosed in a chituous shell. See CHITIN, *ante*. These segments may be separated one by one, with the members attached to them, and examined. Each segment is composed of a convex upper plate called the tergum, and closed beneath by a flatter plate called the sternum, while the side of the segment is called the pleuron. These segments are

again subdivided into parts which are amalgamated, but it is sufficient for the purposes of this article to give only a general description. There are 21 segments in the whole body, 7 in the head, 7 in the thorax, and 7 in the abdomen. The cephalothorax, or the part called the head, is covered with a shield or carapace, sometimes called the cephalic buckler, composed of an enormous development of tergal or dorsal pieces. The first segment of the head is provided with long, movable eye-stalks or peduncles, bearing upon their ends the compound eyes. The next six segments of the head, from before backwards, are furnished with: first, the antennules or smaller antennæ, each composed of a basilar piece called a protopodite, and two somewhat elongated feelers or antennæ; next, the larger antennæ, each composed of a protopodite, and a single, greatly elongated feeler; next, the biting jaws or mandibles, between which is the aperture of the mouth, bounded behind by a forked process called the labium, and in front by a broad plate called the labrum or upper lip. The next two segments after this are provided with appendages called, respectively, the first and second pairs of maxillæ, each situated upon a protopodite, with terminal joints, which in the first pair are rudimentary, but in the second are provided with spoon-shaped joints, called scaphognathites, whose office is to cause a current of water to pass through the gill-chamber by constantly bailing water out of it. The next and last segment of the head (according to Huxley this belongs to the thorax) bears one of the three pairs of modified limbs, called maxillipedes, or foot-jaws. These are legs with the ordinary structure of a protopodite, and three other joints added, called exopodite, endopodite, and epipodite. These limbs are modified so as to aid the purposes of mastication. This description applies to the next two pairs of segments, and which belong to the thorax, according to the usual division. The third pair of appendages of the thorax (the fourth according to Huxley) are the great claws, or chelæ. The next two pairs of thoracic limbs are also provided with nippers or chelæ, but they are much smaller. The last two pairs are similar, except that they are terminated by simple, pointed joints, and not chelæ. These last two pairs, however, differ, in that the next last pair has attached to its protopodite a process which serves to keep the gills apart. Of the segments of the abdomen, seven in number, five—all except the first and last—are provided with appendages called swimmerets. Each swimmeret consists of a basal joint and two diverging joints. The basal joint is the protopodite, the outer of the diverging joints the exopodite, and the inner one the endopodite. In next to the last segment (the last one which has appendages), the swimmerets are greatly expanded, so as to form powerful paddles. The last segment of the abdomen is called the telson; it has no appendages, and for this reason some authorities do not regard it as a segment, but as an azygos appendage, or, in other words, an appendage without a fellow. The first segment of the abdomen will be seen to be considerably modified from those bearing swimmerets.—An esophagus leads from the mouth into a globular-shaped stomach, containing a calcareous apparatus for grinding food. This kind of mill is called the *lady in the lobster*. The intestine passes without convolutions in a nearly straight course to the anal aperture, which is situated on the under-side just in front of the telson. The lobster has a well developed liver, consisting of two lobes, which enter the intestine by separate ducts. The heart is a muscular sack situated in the back just beneath the carapace, and opens by valvular apertures into a surrounding venous sinus, called (improperly) the pericardium. The gills are pyramidal, lance-shaped bodies, situated immediately beneath the heart and attached to the bases of the legs. Each consists of a central stem supporting numerous laminæ, and they are unprovided with cilia. Water is propelled through them by the movements of the legs and by the spoon-shaped joint of the second pair of maxillæ above-mentioned, which is constantly in motion, bailing out water in front of the branchial chamber, thus allowing the entrance of fresh water through the posterior aperture. The nervous system is situated along the ventral surface of the body, and consists of a series of ganglia united by commissural cords. Two compound eyes, two pairs of antennæ or feelers, and two ears in the form of sacks comprise the special organs of sense. The arrangement of the muscular system is in general like that of all articulates.

LOB-WORM, a species of dorsibranchiate annelid belonging to the genus *arenicola*, order *errantia*. It has the specific name *a piscatorium* from being used by fishermen for bait. It lives in deep canals, which it hollows out of the sand on the sea-shore, eating its way and passing the sand through the alimentary canal to extract whatever nutriment it may contain. It has a large head without eyes or jaws, and a short proboscis, and 13 pairs of gills, placed on each side of the middle of the body. See INVERTEBRATE ANIMALS.

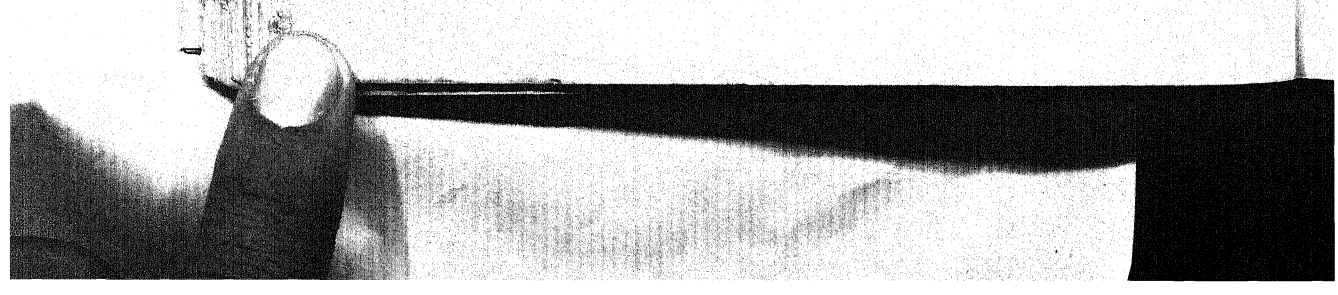
LOCAL PREACHERS. An order of lay preachers in the Methodist churches, their name distinguishing them from the itinerant or traveling preachers. They are not, as the regular preachers are, members of annual conferences, nor are they, like them, appointed by the bishops or stationing committees. They are licensed, and are subjected to the direction of the pastor or presiding elder in whose charge they reside. Sometimes a local preacher, by special arrangement and by the authority of the presiding elder, is appointed a pastor for a specified period. For appointment as a local preacher a person must be recommended by the leader's meeting of the church to which he belongs, and must be elected by a quarterly conference before which he has been exam-

ined as to doctrines and discipline. As proof of his appointment he receives a license signed by the president of the conference, which is for one year only, and must be renewed every year afterwards. For ordination, a local preacher must have held a local preacher's license for four consecutive years, must have been examined in the quarterly conference on doctrines and discipline, must have received a "testimonial" from the quarterly conference signed by the president and secretary, and must pass an examination as to character and attainments before the annual conference.

The office of local preacher was instituted by Wesley. These preachers are laymen who support themselves by their secular business during the week, and preach on the Lord's day, mostly in poor or new churches, receiving, with rare exceptions, no fee or reward for their services. Their number in the United States in all the Methodist bodies is about 22,000. A national local preachers' association has been formed, which meets annually for counsel and the discussion of questions pertaining to their work. Branch associations have been formed in various parts of the United States. In England a *Local Preachers' Magazine* is published.

LOCARNO. See LAGO MAGGIORE.

LOCHABER AXE, an axe with a curved handle and very broad blade. It was the ancient weapon of the highlanders, and was carried by the old city guard of Edinburgh.



LOCHES, a picturesque t. of France, in the department of Indre-et-Loire, on the left bank of the Indre, 25 m. s.e. of Tours. Pop. '76, 3,689. The castle of Loches (now a ruin) acquired a fearful reputation during the reign of Louis XI. as the scene of those deeds of cruelty which were so horrible that they had to be done in utter darkness and secrecy. At a later period, James V. of Scotland was married in this castle to Magdalen of France; and still later, Francis I. received here, in splendid state, the emperor Charles V. on his way from Spain to Ghent.

LOCHRANE, OSBORNE A., b. Middletown, Armagh, Ireland, 1829. Before completing his education he had indulged in such violent denunciations of the British government that his father, in order to place him beyond the reach of prosecution, sent him to New York, where he arrived Dec. 21, 1846. He soon afterwards went to Georgia, where his fluency as a public speaker attracted the attention of an eminent citizen, by whose advice he studied law. Having been admitted to the bar in 1849 he opened an office in Savannah, but soon removed to Macon, where, from 1861 to 1865, he was judge of the circuit court. In the latter year he removed to Atlanta, and in 1870 was made judge of that circuit. In 1871 he was appointed chief-justice of the state supreme court, but resigned at the end of that year to resume practice at the bar.

LOCK of a gun is that apparatus by which the powder is fired. Muskets, in their earliest use, were fired by the hand applying a slow match to the touch-hole. Towards the end of the 14th c., the first improvement appeared in the *matchlock.* This consisted of a crooked iron lever, in the end of which the match was fixed. By a pin-gear of a simple nature, pressure on the trigger brought the match accurately down on the powder pan, of which the lid had previously been thrown forward by the hand. This mode of firing involved the carrying of several yards of slow match, usually wound round the body and the piece; rain extinguished the match, and wind dispersed the powder in the pan, so that the matchlock, clumsy withal, was but an uncertain apparatus.

Superior to the matchlock was the *wheel-lock,* introduced at Nuremberg in 1517, in which fire was produced by friction between a piece of flint or iron pyrites and a toothed wheel. The mechanism which generated the sparks simultaneously uncovered the pan, so that the dangers from wind and rain were averted; but, before firing, the apparatus required to be wound up like a clock, and therefore the charges could not be frequent. The wheel-lock continued for a long period to be used in Germany, and partially in France. In the Spanish dominions, however, its place was supplied by the simpler contrivance called the Snaphaunce, Snapphahn, or Asnaphan lock, of nearly contemporaneous invention, which, acting by means of a spring outside the lock-plate, produced fire through the concussion of a flint against the ribbed top of the powder-pan. Its positions of half and full cock were obtained by the insertion of a pin to stay the operation of the main-spring. In the middle of the 17th c. the *flint-lock* was invented, combining the action of the wheel-lock and the snaphaunce, while it was incontestably superior to either. After combating much prejudice, it was universally adopted in the armies of western Europe by the commencement of the 18th century. Muskets embracing it obtained the name of "fusils," a French adaptation of the Italian word *focile,* a flint. With successive improvements, the flint-lock continued in general use until the introduction of the *percussion-lock* almost in our own day; and among eastern and barbaric nations the flint-lock is still extant. Its great superiority over the snaphaunce consisted in the "tumbler" (of which presently) and the "scear," appliances still retained in the percussion-lock, which enabled the positions of half and full cock to be taken up without the intervention of pins, always uncertain in their action.

The principle of the percussion-lock is the production of fire by the falling of a hammer upon detonating powder, the explosion of which penetrates to the charge in the barrel of the gun. The first practical application of this principle to fire-arms is due to the rev. Mr. Forsyth of Belhelvie, in Aberdeenshire. Various forms in which to ignite the detonating powder have been devised, but that generally accepted until within the

last few years was the copper-cap, fitting tightly on the nipple of the gun, charged with a detonating compound, and exploded by the hammer falling upon it. The main-spring communicates through the swivel with the tumbler, which concentrically with the hammer moves on the tumbler-nail. After the hammer has delivered its stroke, its further progress in the direction required by the spring is barred by the nipple. On pulling back the hammer to the position of half-cock the tumbler turns with it, and the pointed end of the scear (which moves on the scear-nail as center), influenced by the scear-spring falls into a notch in the tumbler. On forcing back the hammer to full-cock, however, the scear will move down to a shallower notch; and on the lever end of the scear being raised by the trigger, it brings down the hammer with a heavy blow on the cap. To keep the works firmly in their several places, a "bridle" is screwed over them which includes the pin through the tumbler in its width.

Since the adoption of breech-loading arms, the action of the lock is so far varied that the hammer usually falls on a movable pin, which is impelled against a detonating charge placed in the body of the cartridge itself. A spiral spring around the pin brings it back to the position necessary for another blow. The advantage of this arrangement is that one operation of loading is substituted for the double process of loading and capping.

LOCK, on a river or canal, is an arrangement of two parallel floodgates, by which communication is secured between two reaches of different levels. When locks were first introduced, is not known within a hundred years, nor is it clear whether Holland or Italy can claim the distinction of having first employed them. This much, however, can be affirmed with certainty, that at the beginning of the 17th c. locks existed in both countries, and it is probable that they were arrived at gradually by successive improvements in the mode of rendering shallow rivers navigable. Obviously, the first step would have been to dam the stream across at intervals, leaving gates in the dams for the passage of vessels. This measure would have divided the river into reaches or steps, each, as the source was approached, being higher above the sea than the one last passed. But the passage up or down—and especially up—such a stream must be extremely slow, as at each dam a vessel must wait until the gate has been opened, and the level equalized in the reach it is in, and that on which it is proposed to enter. Where the reaches were far apart, a large body of water would require to be raised or lowered, and the process could not but be tedious. The mediæval engineers next tried to place the dams as near together as possible, but expense limited this. The course then was to build two dams, with floodgates, just far enough apart to allow a vessel to float within. Under this arrangement, only the section between the dams had to be raised or lowered. The cost of thus doubly damming a wide river, however, was very great, and it was an easy transition of idea to remove the passage from the main stream altogether and construct a *lock* with double gates which should open at one end above and at the other below the dam or weir. The economy of money in building, and of time and water in working, was obvious; and on this principle all locks are now made, wherever there is traffic of any importance. The arrangement consists of two pairs of gates, opening up the stream, and offering, when shut, a salient angle to the stream or upper pressure. The effect is that the weight above only tends to close the gates still tighter. When a vessel is to be brought from one level to the other, it is floated into the "pound," as the space between the upper and lower gates is called. The gates are then shut, and a sluice in the lower part of the upper gate raises the surface of the pound, or the sluice in the lower gate depresses it in a few minutes to the level of the upper or lower reach, as the case may be. These sluices are worked by racks in the gates, and the ponderous gates themselves are moved with the aid of long and heavy levers. Of course, one pair of gates must always be shut, or the two reaches would speedily assimilate their levels.

On canals where water is scarce, a reservoir, equal in size to the lock, is formed at its side. When the pound is to be emptied, the water is run into the reservoir until it and the lock are at the same level, which will be half height. The reservoir is then closed, and the remaining water in the lock run off through the lower sluices in the usual way. On refilling the lock, before opening the upper sluices, one-quarter the quantity required can be obtained from the reservoir, thus effecting a saving of many tons of water at each filling.

On rivers advantage is taken of islands for the formation of weirs (q.v.) and locks. On the Thames the locks are from 2 to 3 m. apart, and the river is locked by upwards of 50 locks from Teddington to Lechlade. On canals, to economize superintendence, the locks are usually constructed in "ladders" of several close together, like a flight of steps. As the pressure on lock-gates is very great, and varies with the height of water above, the rise in one lock is rarely more than 8 or 9 ft., although in some instances 12 ft. have been accomplished, and in a very few cases even more.

LOCK, a contrivance for securely fastening the door of a building, the lid of a box, etc. Amongst the early Egyptians, Greeks, and Romans, locks were used, but their construction evinced little skill, and they were usually made of hard wood; in fact, they were little more than wooden bolts, requiring only the hand to unfasten them. The first advance upon this was a remarkable one, invented by the ancient Egyptians; it contained the principles of the modern tumbler-lock; but although still in use amongst

the modern Egyptians and Turks, it has never, in their hands, made any advance. This lock consists of a case, which is nailed to the door; through the case passes a large wooden bolt, the end of which enters the staple, whilst the opposite end is left exposed. In the lower part of the bolt is a square groove, which has certain round or square holes. When the bolt is pushed home into the staple, these holes come exactly under corresponding little cavities in the case, in each of which is placed an upright wooden pin with a knob, which prevents its falling too low: these little pins consequently fall into the holes in the bolt when it is pushed far enough, and the door is locked. In order to unlock it, a bar of wood is passed into the groove in the bolt, and on the bar there are the same number of pins of wood placed upright as there are holes in the bolt and loose pins in the chambers of the case; and these upright pins are placed so as to correspond exactly in size and position to the holes; therefore, when the pins reach the holes, they slip into them and push up the loose pins into their respective cavities, and the bolt is then easily pulled back by means of the bar or key. This is simple and ingenious, but it is very clumsy, and, as usually made in Turkey, is not secure. Nevertheless, it has been in use longer than any other form of lock in existence.

During the middle ages, very complicated and ingenious locks of various kinds were made, and as much artistic taste was expended upon the ornamentation of their external metal work as there was skill in the interior mechanism. Such locks, however, were not adapted to general use, and they were only found on the caskets of the wealthy. The ordinary ward and spring locks were the only ones commonly employed up to the beginning of the present century, even for important purposes, and this kind of lock is still in very common use. It consists of a bolt of metal, to which a spring is attached, and it is moved backward or forward by means of a key, which by raising the bolt compresses the spring in the slot, through which it works, and so lets it pass on until out of the range of the key's action, which turning on a pivot is regulated by the length of its wards and the depth of a curve cut in the under side of the bolt. In order to prevent any key of the same size opening all such locks, little ridges of iron are placed in circles or parts of circles, and wards are cut in the keys so as to correspond with them; hence, only the key which has openings or wards which will allow the ridges to pass through them can be used. The bolt has at the end opposite to that which enters the staple a small piece slit, bent outwards, and tempered hard; this forms the spring; below are two notches, divided by a curved piece of the bolt; there is another notch, which if the key enters and is turned round it draws the bolt forward or backward in locking or unlocking, and the spring makes the end of the bolt either drop into one of the notches or rise up the curve, according to the distance to which it is pulled. The ridges are so placed as to allow the wards of the key to move freely, and to prevent the entrance of another key of different arrangement.

The *tumbler-lock* is the type of another class, and is an advance upon the last; the two principles are, however, in most cases combined. The principle of the tumbler-lock will be readily understood by a lock nearly like the former, to which a description of the simplest form of *tumbler* has been added. The bolt has neither the string-piece nor the notches and curves on the under side, but it has two notches on the upper side, which are exactly as far apart as the distance moved by the bolt in locking or unlocking. Behind the bolt is the tumbler, a small plate moving on a pivot, and having projecting from its face a small square pin, which when the bolt is locked or unlocked falls exactly into one or the other of the small notches. There is in the key a notch which corresponds to the outline of the tumbler. This acts upon the tumbler when the key is turned, and raises it so as to lift the pin out of the notch in the bolt, and allow the latter to be moved freely forward until the other notch comes under the pin, when the latter falls into and immediately stops its further progress, and the action of the key must be reversed in order to relieve it again. This very simple application of the tumbler is sufficient to explain the principle which may be and is varied to an almost endless extent. Chubb's justly celebrated lock carries it out most fully, the bolt itself being only a series of tumblers, with a notch on the key for each. Bramah's lock, patented in 1788, has enjoyed immense reputation, chiefly for cabinets, desks, and other similar applications; it is very different in principle from those before-mentioned, consisting of a number of movable slides or interior bolts working in an internal cylinder of the lock, and regulated by the pressure upward or downward of the key acting on a spiral spring. For ordinary purposes it is very secure; but when the most perfect security is required, the beautiful lock invented by Mr. Cotterill of Birmingham, and the still more ingenious one of Mr. Hobbs of America, must be preferred. These beautiful and complicated pieces of mechanism cannot be described within the limits of this article; but ample information upon them and others can be found in Mr. Denison's *Treatise on Locks*, and in *The Rudimentary Treatise on the Construction of Locks*, by Charles Tomlinson.

LOCK (*ante*). An important class of locks are what are called permutation and dial locks, and are used upon burglar-proof safes. One of the principal devices in them is the employment of a number of wheels, placed near together, on an axis on which they move independently. These wheels do not interfere with the motion of each other except when certain pins are brought in contact, the pins being movable at the will of

the person adjusting the lock. In this way one having knowledge of the combination may arrange the wheels so that certain slots in their peripheries will not coincide, and cannot be made to coincide, by any one not in possession of the arrangement. The person having such knowledge may, however, readily place the slots into line and pass a key through them, by which means alone the bolt of the lock is moved. An ingeniously arranged dial is placed on the outside of the safe door, through which a bolt passes attached in the lock to a wheel. This fixed wheel can be turned one way or another, and, being provided with a pin, the first of the movable wheels may be turned so that its slot will correspond to any number on the dial. This first movable wheel, being also provided with a pin upon its disk, is made to turn the second wheel to a certain position, and so on to the last wheel, when, the slots being all brought into line, the key is introduced. There are a great many varieties of these locks, each possessing various advantages. As burglars often compel the person having the knowledge of the combination of a lock to reveal the secret, it is often the practice to employ for bank-vaults locks with a clock-work attachment by means of which the bolt is liberated at a certain hour, until which time, nobody, not even the person possessing a knowledge of the combination, can open the lock.

LOCK, or GOWPEN, in Scotch law, is the perquisite paid by custom to the miller's man for grinding corn. See THIRLAGE.

LOCK, MATTHEW, 1635–77; b. Exeter, Eng.; received instruction in the rudiments of music from Wake, organist of Exeter cathedral, and completed his studies under Edward Gibbons. When Charles II. made his entry into London after the restoration, Lock was employed to write the music for the occasion, and was afterwards appointed composer for the king. The first piece that bore his name was *A Little Consort of Three Parts*, for viols and violins. He was the first musician of England who composed music for the stage; and he wrote the instrumental music in the *Tempest* and *Macbeth*. In 1675 he composed the overture and airs to Shadwell's *Psyche*. He wrote several sacred pieces found in the *Harmonia Sacra*, and in Boyce's *Collection of Cathedral Music*, which show him a master of harmony; but his fame rests chiefly on his music in *Macbeth*, which his biographer says is "a lasting monument of the author's creative power and judgment." He wrote also some controversial musical treatises. A few years before his death he became a Roman Catholic.

LOCKE, JOHN, was b. at Wrington, near Bristol, on Aug. 29, 1632. His father was steward to col. Popham, and served under him as capt. in the parliamentary army during the civil war. Locke was sent for his education to Westminster school, where he continued till 1651, when he was elected a student of Christ church, Oxford. There he went through the usual studies, but seemed to prefer Bacon and Descartes to Aristotle. His tendency was towards experimental philosophy, and he chose medicine for his profession. In 1664 he went to Berlin as secretary to the British envoy, but soon returned to his studies at Oxford. In 1666 he made the acquaintance of lord Ashley, afterwards earl of Shaftesbury, and on his invitation went to live at his house. In 1672, when Shaftesbury became lord chancellor, Locke was appointed secretary of presentations, a post which he afterwards exchanged for that of secretary to the board of trade. He was employed to draw up a constitution for the American province of Carolina, but his articles on religion were deemed too liberal, and the clergy got a clause inserted, giving the favor of the state exclusively to the established church. In 1675 he took up his residence at Montpellier for the benefit of his health. He had all his life an asthmatic tendency, which at that time threatened to pass into consumption. At Montpellier, he formed the acquaintance of the earl of Pembroke, to whom his *Essay* is dedicated. In 1679 he rejoined the earl of Shaftesbury in England; but in 1682 the earl fled to Holland, to avoid a prosecution for high treason. Locke bore him company, and so far shared with him the hostility of the government of James as to have his name erased, by royal mandate, from the list of students of Christ church. Even in Holland he was demanded of the states-general by the English envoy; but he contrived to conceal himself till the English court ceased to trouble itself on his account. In 1687 his *Essay on the Understanding*, begun 17 years before, was finished; and an abridgment of it was published in French (1688) by his friend, Le Clerc, in his *Bibliothèques*, in which Locke had published two years before his *Method of a Commonplace Book*. In 1689 appeared (also in Holland) his first letter on *Toleration*. But in 1688, the year of the revolution, he came back to England in the fleet that conveyed the princess of Orange. He soon obtained from the new government the situation of commissioner of appeals, worth £200 a year. He took a lively interest in the cause of toleration, and in maintaining the principles of the revolution. In 1690 his *Essay on the Understanding* was published, and met with a rapid and extensive celebrity; and also a second letter on *Toleration*, and his well known *Treatises on Government*. In 1691 he was engaged upon the momentous question of the restoration of the coinage, and published various tracts on the subject. In 1692 he brought out a third letter on *Toleration*, which, as well as the second, was a reply to the attacks made on the first. In 1693 was published his work on *Education*. In 1695 king William appointed him a commissioner of trade and plantations. In the same year he published his treatise on *The Reasonableness of Christianity*, which was written to promote William's favorite scheme of a comprehension of all the Christian

sects in one national church. He maintained a controversy in defense of this book; he had another controversy in defense of the *Essay on the Understanding*, against Stillingfleet, the bishop of Worcester. His feeble health now compelled him to resign his office of commissioner of plantations, and to quit London; and he spent the remainder of his life at Oates, in Essex, at the seat of sir Francis Masham. His last years were very much occupied with the study of the Scriptures, on which he wrote several dissertations, which, with his little work, entitled *On the Conduct of the Understanding*, were published after his death. He died Oct. 28, 1704.

Great as was Locke's services to his country, and to the cause of civil and religious liberty, his fame rests on the *Essay on the Understanding*, which marks an epoch in the history of philosophy. His purpose was to inquire into the powers of the human understanding, with a view to find out what things it was fitted to grapple with, and where it must fail, so as to make the mind of man "more cautious in meddling with things exceeding its comprehension, and disposed to stop when it is at the utmost extent of its tether." This purpose led him to that thorough investigation of the constitution of the human mind, resulting in the most numerous and important contributions ever made by one man to our knowledge on this subject. He institutes a preliminary inquiry, in the subject of the first book, as to the existence of innate ideas, theoretical and practical, on which the philosophical world has been so much divided. See COMMON SENSE. Locke argues against the existence of these supposed innate conceptions, or intuitions, of the mind with a force and cogency that appear irresistible. Having thus repudiated the instinctive sources of our knowledge or ideas, he is bound to show how we come by them in the course of our experience. Our experience being twofold, external and internal, we have two classes of ideas—those of sensation and those of reflection. He has therefore to trace all the recognized conceptions of the mind to one or other of these sources. Many of our notions are obviously derived from experience, as colors, sounds, etc.; but some have been disputed, more especially such as space, time, infinity, power, substance, cause, mere good and evil; and Locke discusses these at length, by way of tracing them to the same origin. This is the subject of book second, entitled "Of Ideas." Book third is on language considered as an instrument of truth, and contains much valuable material. The fourth book is on the nature, limits, and reality of our knowledge, including the nature of demonstrative truth, the existence of a God, the provinces of faith and reason, and the nature of error.

LOCKE, DAVID ROSS, more widely known by his *nom de plume* of Petroleum V. Nasby; b. Vestal, Broome co., N. Y., 1833. He became a printer in the office of the *Cortland Democrat*, and subsequently publisher and editor of the *Plymouth Advertiser*, the *Mansfield Herald*, the *Bucyrus Journal*, the *Findlay Jeffersonian*, and the *Toledo Blade*, all in Ohio. In 1860 he began the publication of the Nasby letters in the *Findlay Jeffersonian*, and soon after continued them in the *Toledo Blade*. They were designed to throw ridicule on the flimsy logic then in vogue to bolster or shield the institution of slavery. The keenness and pungency of the satires were instantly recognized wherever read. They soon gained wide circulation, and became a powerful auxiliary to the administration of Lincoln in aiding to paralyze the efforts of northern sympathizers with the southern cause. In 1866, when president Johnson was seeking popular support for his policy by traveling in the west with his cabinet, Locke, under the same *nom de plume*, made the expression of "swinging round the circle" as ridiculous and notorious as possible, by grotesquely journalizing the daily doings of the cortege. As an editor Mr. Locke is remarkable for terse and vigorous thought and diction; and whether humorous or serious is always a trenchant writer. It is his misfortune, however, to have courted popularity among men of low tastes, and the tendency of his writings has been of late to a lower grade of subjects. In 1875 he published *The Morals of Abou Ben Adhem;* and in 1879 a coarse comic drama entitled the *Widow Bedott*, simply an adaptation of the comic story of that name written by Mr. Frances M. Whitche in 1854, and of no credit to Mr. Locke in conception or adaptation, though it has proved popular with a certain grade of theater-goers. Mr. Locke is still publisher and editor of the *Toledo Blade*.

LOCKED-JAW. See TETANUS.

LOCKHART, JOHN GIBSON, was b. at Cambusnethan, in Scotland, in 1794. His father was a minister of the established church of Scotland. Lockhart received the first stages of his education at Glasgow, and afterwards proceeded to Oxford, where, in 1813, he took first-class honors. In 1816 he became an advocate at the Scotch bar. He appears, however, to have wanted the qualifications necessary for success in this profession, and besides the bent of his mind was more toward literature than law. He and Wilson were long the chief supporters of *Blackwood's Magazine*. Here he began to exhibit that sharp and bitter wit that was his most salient characteristic and made him the terror of his enemies. It was this connection which led to his acquaintance with sir Walter Scott. In 1819 appeared *Peter's Letters to his Kinsfolk*. In 1820 he married Miss Scott, eldest daughter of sir Walter. In 1821 he published *Valerius*, and in 1823 *Adam Blair*. Both of these works, especially the latter, show him to have possessed, at least, a thorough acquaintance with the rules of art in fiction-writing. In 1823 appeared his *Reginald Dalton*, a tale of English university life, and in 1824 his *Ancient Spanish Ballads*, perhaps the most popular of all his writings. In the same year he published his last

novel, *History of Matthew Wald.* From 1826 to 1853 he edited the *Quarterly Review.* From 1837 to 1839 appeared his *Life of Scott,* a work of undoubted merit, but which has given rise to much bitter controversy. In 1837 his wife died, having been predeceased by their eldest son, Hugh. His second son died at a later period. In 1843 Lockhart was appointed auditor of the duchy of Cornwall, with a salary of £600 a year. In 1847 his only remaining child, a daughter, the sole surviving descendant of sir Walter Scott, married J. R. Hope, Esq. She died in 1858, leaving an only daughter, who inherited the estate of Abbotsford. Lockhart died Nov. 25, 1854.

LOCK HAVEN, a city in Pennsylvania, capital of Clinton co., on the s. bank of the w. branch of the Susquehanna river, at the mouth of Bald Eagle creek, and on the w. branch canal and the Philadelphia and Erie and the Bald Eagle division of the Pennsylvania railroad; 70 m. n.n.w. of Harrisburg; pop. '70, 6,986. It is the center of an extensive lumber trade, contains 13 churches, 2 national banks, 3 weekly newspapers, and graded public schools.

LOCK'PORT, a city of New York, U. S., on the Erie canal and the Rochester and Niagara Falls railway, 55 m. w. of Rochester. The canal here falls 60 ft., with 5 combined double locks, and its surplus water gives power to 5 flouring-mills, 7 saw-mills, 5 stave and shingle factories, machine-shops, and foundries. There are 13 churches, 4 banks, 2 daily and 3 weekly newspapers, and tanneries, manufactories of agricultural implements, glass, etc. Pop. '75, 12,624.

LOCKPORT (*ante*) was incorporated as a city in 1865. The railroad crosses the canal by a bridge 500 ft. long and 60 ft. above the water; the surplus water of the Erie canal, after being raised 60 ft. by 5 double combined locks, is distributed through a hydraulic canal three-fourths of a mile long to the various manufactories of the city. This immense water-power is the chief source of the city's prosperity, affording as it does almost unexampled facilities for manufactures of every kind.

LOCKROY, JOSEPH PHILIPPE, a French dramatist, b. Turin, 1803. His true name is SIMON. He excelled as an actor of the *Comédie Française,* but left the stage and devoted himself to writing for it with Scribe, Anicet-Bourgeois, and others. His most popular plays are *Passé Minuit; Les Trois Épiciers; Le Chevalier du Guet;* and *Charlot et le Maître d'École.* He wrote in connection with Alexander Dumas a drama entitled *Conscience.* He wrote also the librettos for *La Reine Topaze,* and other operas.

LOCK-UP HOUSES, the name given to the houses of bailiffs of the sheriff, to which debtors arrested for debt are first taken, until it is seen whether they will settle their debt without being taken to the ordinary jail. See EXECUTION; IMPRISONMENT.

LOCKYER, JOSEPH NORMAN, b. Eng., 1836; received his education at private schools in England and on the continent. In 1857 he was appointed to a position in the war-office, and in 1865 became editor of *Army Regulations.* He was appointed in 1870 secretary of the royal commission on scientific instruction and the advancement of science, from which he was afterwards transferred to the science and art department of the same organization. He is best known for his services in astronomy and physics: he discovered a method of observing sun phenomena, in commemoration of which the French government caused a medal to be struck in 1872. He has held the position of chief of several government expeditions for astronomical observation. In 1874 he received the Rumford medal from the royal society. He has published *Contributions to Solar Physics,* 1873; *The Spectroscope and its Applications,* 1873; *Star Gazing, Past and Present,* 1878; and other works.

LO'CLE, a frontier t. of Switzerland, canton of Neuchâtel, and 10 m. n.w. of the town of that name. Pop. '70, 10,334, who are engaged chiefly in watch-making. Upwards of 80,000 watches are annually manufactured.

LOCO, in music, indicates that the notes are to be played exactly as they are written.

LOCOMOTIVE, COMPRESSED AIR. The attention of engineers has for a few years past been directed to the construction of locomotives using compressed air instead of steam. Compressed air for driving stationary engines for rock-drilling in tunnels has been in use for some time, but in these the compressed air was directly furnished by a pump driven either by steam or water-power, the latter being preferred where convenient. At the present time the application of compressed air to locomotives is thought practical only for short lines and where steam is objectionable, but it is possible that in the future long lines of railway may be furnished with pneumatic pipes, or with pumping-stations, and receive their motor power in this manner. Compressed air street-motors have been used in Glasgow, Paris and New York; and two Scottish engineers, Robert Hardie and John James, have been and still are engaged in this country upon the problem. It is said that the pneumatic engines devised by them, which have been running at intervals on the Harlem portion of the Second avenue surface road, between 96th and 130th streets, have proved so satisfactory that no doubts are entertained by the pneumatic tramway company that before many years this mode of propelling passenger cars on comparatively short distances will be generally adopted. It is believed that the properties of atmospheric air have not been utilized to anything near their natural limits.

The first problem in compressed-air locomotion is to compress and store air in a resevoir of suitable dimensions to be carried on a street-motor or car. In order that such car may be driven several miles and make numerous stops, a considerable amount of energy must be stored at the commencement of the trip, unless pneumatic pipes be laid along the line. In any case a certain distance has to be run before the compressed air reservoir can be replenished. The reservoir of compressed air may, therefore, be compared to the fuel of a steam-engine, although the air derives its energy from the fuel which supplies the compressing steam-engine. This comparison may show the importance of furnishing the motor with a conveniently disposed air-chamber filled with highly compressed air, and also of maintaining an equable pressure upon the driving pistons, while the compressed air is constantly diminishing in tension by its escape in performing its work. It is said by engineers who have given practical attention to the subject that it will be desirable to use an initial pressure of about 500 lbs. to the sq.in., which is the equivalent of about 33 atmospheres. A pressure of 300 lbs. to the sq.in., or 20 atmospheres, has been found practicable, and most motors have hitherto been run with this pressure. Of course, the compression of the air converts a vast amount of latent into sensible heat. See HEAT, *ante; Latent Heat.* This energy is lost because there is no way to prevent the sensible heat from being conducted away or dispersed. If the air be introduced into the motor reservoirs in the heated and dry condition which it attains in the pump cylinder, it would not be fit to perform its duty in the driving cylinders of the motor. It would not, however, retain its expanded volume in the motor reservoir without being kept heated. Before entering these reservoirs it must be cooled, and it is not improbable that the heat with which it parts on cooling may be utilized in producing a part of the steam for the pumping engine. The methods of cooling are various; those employed in compressing-engines for furnishing air directly to stationary air-engines have the pump cylinder surrounded by a cold-water jacket, or have a circulation of cold water in the cylinder head, or have sprays of cold water forced into the pump cylinder. The air for a store cylinder from which motors take their compressed air may, however, be more conveniently cooled by passing it through a tank of cold water.

In using a pneumatic motor there are three different machines all receiving their energy from the boiler steam. 1. The engine which drives the compressing machine; 2. The compressing machine itself; and 3. The engine which drives the locomotive. It is estimated that the loss of power in all these amounts to about one-half of that contained in the steam boiler of the pumping engine. One of the earliest compressed air locomotives was devised by M. Ribourt, the engineer at St. Gothard (see TUNNEL), for hauling debris from the tunnel. M. Ribourt's method for equalizing the pressure upon the driving pistons was the employment of a sliding cylinder inside of and concentric with the cylinder in which the driving piston moves. This inside cylinder is controlled by a spiral spring which is connected with the piston rod. Compressed air at the initial pressure enters the cylinder between the piston heads. Within this space it therefore has no effect, but it passes from this chamber through orifices into an outer jacket, and thence again on the further side of one of the piston heads, that one opposite the end to which the spring is applied. These orifices pass through both inside and outside cylinders, and their capacity depends upon the relative positions of the two cylinders. The adjustments of the different parts of the apparatus are so made that, when the air passes through the jacket to the outer surface of the piston head upon which it acts at its initial pressure the orifices in the cylinders do not exactly coincide, and their capacity is therefore diminished. As, however, the tension of the air diminishes, the spiral spring, acting against the pneumatic pressure, forces the inside cylinder farther back, at the same time increasing the capacity of the openings in the two cylinders by making them more nearly coincide. This increase of capacity of orifice is in the inverse ratio to the pressure, and the action is reciprocal and continuous. Considerable modifications have been made in motors running upon tramways in Glasgow, Paris, and New York. M. Mekarski has successfully propelled motors in France with compressed air at 450 lbs. per sq.in., or 30 atmospheres. The ordinary high-pressure locomotive engine is the form used, but the compressed air before reaching the cylinders is forced through a tank of hot water at about 220° F., by which means it becomes saturated with steam. An equalizing throttle-valve is placed on the top of the hot-water reservoir, for the purpose of regulating the pressure upon the pistons. Two of the locomotives were exhibited at the Paris exposition of 1878, one a car motor, the other a separate motor. The latter could draw a car containing 30 passengers from 10 to 11 m. on a level, and could ascend a grade of 5 to 100. Further improvements, it is said, have been introduced on motors which have been running on the Second avenue railroad in New York. One of the improvements is the passing of the compressed air through water heated to about 328°. It is claimed that the motors have worked successfully, and at a less cost than when horses are used for the same amount of work. Some engineers, however, do not accept these estimates, and it is declared that the experience at Glasgow, where both compressed air and steam motors have been used, indicates that the pneumatic motor requires more than four times the expenditure of steam to perform the same work that the steam motors do; and a leading French engineer says that at Paris it is estimated that the cost of motive power on street railways, calling horse-power 100, will be, for

compressed air, 64, and for steam power, 20, making compressed air a little more than three times as expensive as steam. It must, however, be understood that but a short time has elapsed since the first trials were made, and yet that considerable progress has been made—perhaps greater than has ever attended the development of any similar invention. A pamphlet issued by the pneumatic tramway engine company of New York contains a letter from gen. Herman Haupt, its consulting engineer, in which he says "that although one-half the power of the stationary engine is lost in compressing air, yet the economy of fuel can be made so great that a given amount of power in compressed air is secured at one-half the cost of the direct application of steam to motors." The difference in specific heat of water and of air also is important as regards the advantage in economy of air. See HEAT, *ante; Specific Heat.* Gen. Haupt again says: "By a simple device of heating the air by passing it through a tank of water it is claimed as the result of constant practice in Paris, confirmed by recent experiments on the Second avenue railroad, that the capacity for work is doubled, or the gain 100 per cent, making the economy of power, as compared with the direct application of steam to street motors, measured as it should be by the coal consumed, four to one in favor of compressed air." Again: "The motor cylinders are so arranged that in descending steep grades they act as air pumps, and at the same time as brakes, by which means it is found, as stated by the company's engineer, Mr. Hardie, that in running down grade on the Second avenue railroad, pumping back against a pressure of 200 lbs. in the receiver, the pressure was increased 7 lbs. in a distance of four-tenths of a mile."

LOCOMOTIVE ENGINE. See STEAM-CARRIAGE; STEAM-ENGINE, *ante.*

LO'CRI, or LOCRI EPIZEPHY'RII, a t. of the Greek Locrians in Italy, on the s.e. coast of the Bruttian peninsula. The name seems to indicate that it was a colony of a Locrian settlement at cape Zephyrium (capo di Bruzzano), on the Ionian sea. The date of its foundation is uncertain, some putting it B.C. 710, and others 683. The Locri Epizephyrii are said to have been the first Greek people who had a written code of laws. This code, drawn up by Zaleucus about B.C. 664, was so excellent that in the time of Demosthenes Locri is cited as an example of good government; and to the institutions of Zaleucus this city owed its prosperity and fame. In the battle at the river Sagras 10,000 Locrians defeated with great carnage 130,000 Crotoniats. After 205 B.C. Locri declined in importance, and after the 6th c. no author makes mention of it. Its site has been found about 5 m. from the modern Gerace, containing, among other remains, the fragments of a Doric edifice supposed to have been the temple of Proserpine. Several distinguished poets and philosophers were natives of Locri.

LO'CRIS—LOC'RIANS, an ancient Grecian race, in later times merged with the Achaians, deriving their name from Locrus, a king of the Leleges, from whom they descended. In historic times two distinct tribes were known. The eastern Locrians, divided into the Opuntii and Epicnemidii, dwelt opposite the island of Eubœa on the e. coast of Greece, and were said by Homer to be followers of Ajax son of Oileus to Troy. The western Locrians were called Ozolæ, and lived on the Corinthian gulf, w. of Phocis. From the first tribe were probably descended: 2. LOCRI EPIZEPHYRII, who not far from 700 B.C. founded a city in Magna Grecia on cape Zephyrium, now capo di Bruzzano. The Locrians were engaged in many wars with neighboring tribes, were held in subjection by the younger Dionysius after his banishment from Syracuse, B.C. 356, and during the wars of Rome with Pyrrhus and Carthage the city was alternately occupied by the opposing parties. The first code of written laws ever adopted by any people is said to have been that of Zaleucus, a Locrian king. Locris is said to have been destroyed by the Saracens as late as A.D. 600. In the existing century explorers have discovered ruins near the modern town of Gerace, thought to be those of a celebrated Locrian temple to Proserpine.

LOCUS, in geometry, denotes the line or surface traversed by a point which is constrained to move in accordance with certain determinate conditions. Thus, the locus of a point which must always preserve the same uniform distance from a fixed point is the surface of a sphere; but if the motion be at the same time confined to a plane, the locus in this case will be a circle: this is an illustration of the division into *solid* and *plane* loci which prevailed among the ancients. The Greek geometers made their geometrical analysis depend much upon the investigation of loci, but no specific records of their progress in this branch of geometry now exist. What would appear to have been their method was restored by Dr. Simson of Glasgow, whose work, *De Locis Planis* (1749), is a model of elegance. In modern geometry, plane loci are treated under the name of curves (q.v.).

LOCUS DELICTI, the place where a crime was committed, is a phrase used in criminal law.

LOCUS PŒNITENTIÆ, the time to withdraw from a bargain—a phrase often used in Scotch law. The general rule is that until the contract is finally settled either party may retract; but if *rei interventus* has intervened—i.e., if some act has been done by the other party on the faith of the agreement, and by which his position has been altered—the *locus pœnitentiæ* is barred. Much depends on the circumstances of each case as to the application of the rule.

LOCUST (*locusta* of some entomologists, and *acrydium* of others), the type of a family (*locustidæ* or *acrydidæ*) of the order *orthoptera* and section *saltatoria* (see GRYLLUS). Locusts differ from grasshoppers and crickets in their short antennæ and in the greater robustness of their bodies and limbs. The head is large, with two projecting oval compound eyes, and three stemmatic eyes on its summit. The wings when folded meet at an angle above the back; the abdomen is conical and compressed. Their hind-legs are large, and they possess a great power of leaping. They make a stridulant noise by the friction of the rough hind-legs against the wing-covers. The wing-covers are leathery, narrower than the wings, but equal to them in length; the wings are large, reticulated, fold like a fan, and are often beautifully colored—red, pink, brown, green, or blue. The power of flight of locusts has been the subject of much dispute, some asserting that they can fly to great distances, others that they have little power of flight and are merely carried before a gale of wind. The truth seems to be between these extreme opinions: locusts fly well, but they are sometimes wafted by winds where their power of flight would never have carried them. Their food consists of the leaves and green stalks of plants; the mandibles and maxillæ are strong, sharp, and toothed, and in eating they use their fore-feet to bring their food to their mouths. They generally quite consume any stalk of grass or other green thing which they have selected and cut. The terrible ravages of locusts are owing to the vast numbers in which they appear, filling the air like flakes of snow; darkening the sky, so that object casts no shadow; seeming, in the distance, like a thick smoke; advancing with a sound like the rushing of chariots or of waters, or, in the words of the prophet Joel, "like the noise of a flame of fire that devoureth the stubble;" whilst, as he also says, "the land is as the garden of Eden before them, and behind them a desolate wilderness." They eat up every green thing, and after the grass and leaves they devour in their hunger the bark of trees and shrubs. Ripe grain, however, may escape, as being too hard and dry. These multitudinous swarms of locusts do not appear annually; it is only after the lapse of a number of years that they are again so great and so destructive; and particular years are marked in the history of some countries as years of their extraordinary abundance, and of consequent famine and pestilence. When driven by a strong wind into the sea, they have sometimes been flung back on the beach in such quantities as to produce a stench intolerable to a great distance.

Locusts are found in almost all parts of the world except the coldest regions, but they abound chiefly in tropical and subtropical countries, and most of all in Arabia and Africa. The eastern and southern parts of Europe are occasionally visited by their destructive hosts, and in the s. of France rewards are paid for the collection of locusts and of their eggs. The eggs are found cemented together in little masses in the ground. The insects themselves are taken by means of a stout cloth, the edge of which is made to sweep over the surface of the ground, and the locusts thus thrown together are quickly gathered into sacks. A similar mode of diminishing the nuisance is adopted in North America; but before an invasion such as districts of Asia and Africa are occasionally subjected to all human effort fails.

Locusts are eaten in many countries, roasted or fried in butter. They are also preserved in brine or dried in the sun. They thus appear in the markets of Arabia, Syria, Egypt, Madagascar, etc., and are even exported as an article of commerce.

The most noted species is *locusta migratoria* (or *acrydium migratorium*) about 2½ in. in length, greenish, with brown wing-covers marked with black. It is this species which is most frequently seen in Europe. It is a rare visitant of Britain. Other species belong to other parts of the world. Some of them, forming the genus *truxalis*, and inhabiting the warmest countries, are remarkable for their elongated conical head.

The little chirping "grasshoppers" most common in Britain, differing from true grasshoppers in their short antennæ, belong to the genus *tetrix* and family *locustidæ*.

LOCUST (*ante*) and GRASSHOPPER (*ante*) are here considered together because of the confusion in the popular mind in regard to them. Their similarity in form and habits is considerable, and by some of the best authorities they are placed in one division under the name of grasshoppers, including two families, the acrididæ and locustidæ, the acrididæ forming the family of locusts, while the locustidæ form the family of grasshoppers. There has long been a popular error in regard to the identity of the locust, the idea having been very widely spread that a species of hemipterous insect, the seventeen-year cicada, allied to the dog-day harvest-fly, is the true locust. As classified by the U. S. entomological commission, probably the best authority for the general reader, the section of orthoptera called *saltatoria* is divided into three families, acrididæ, locustidæ, and gryllidæ, the latter family including the crickets. The acrididæ and locustidæ form a subsection or group called grasshoppers, for the insects comprising both these families are really grasshoppers, and the locust is quite as much of a grasshopper as any of the members of the other family; indeed, he may be regarded as the grasshopper *par excellence*. The principal distinctions between the two families are given in the article LOCUST, *ante*. See also CRICKET; GRASSHOPPER; CICADA, *ante*. Both the old-world and new-world locusts belong to the family acrididæ, but are in many cases of different genera, which, however, are said to shade off into one another, so that it is difficult to tell in which group to place some of the members. Most of the old-world

locusts belong to the genus *pachytylus*, the more devastating species being *P. migratorius*, but in south-western Europe the more common genus is *caloptenus*, the name of the Rocky-mountain genus; but the species is not the same. The locust of Algeria belongs to the genus *acrydium*, *A. peregrinum*. The old-world locusts are much larger than the Rocky-mountain locust, and probably a more formidable animal. More minute classifications are made, not needful here; as, for instance, the family acrididæ, containing as it does a very large number of species varying considerably in form and character, has been again divided into three subfamilies, *proscopinæ*, *acridinæ*, and *tettiginæ*, the acrididæ including the migratory locusts. The Alps form a dividing barrier or partition to the two different genera of European migratory locusts. There are many species of acrydium genera spread over the world, but as the most of them do not have the multiplying and migratory power of the few species which are among the world's historical scourges, they are not popularly known as locusts, but pass under the name of grasshopper: many of them may be seen in various localities, hopping along the fences, roadsides, mown meadows, and pastures, and can be distinguished by their much shorter antennæ and more robust bodies. Most of the facts in this article in regard to locusts are taken from the first annual "Report of the U. S. Entomological Commission for the year 1877, relating to the Rocky mountain locust." This valuable work is the record of investigations chiefly by profs. C. V. Riley, A. S. Packard, and Cyrus Thomas. According to Ororius, "in the year of the world 3,800 certain regions of n. Africa were visited by monstrous swarms; the wind blew them into the sea, and the bodies washed ashore 'stank more than the corpses of a hundred thousand men.'" According to St. Augustine, another locust plague, causing famine and contagious diseases, occurred in Numidia, resulting in the death of 800,000 men. Pliny states that locusts came over in great swarms from Africa to Italy in his time. Great invasions of locusts have occurred in Germany: one in 1333, lasting till 1336; another in 1475; others in 1527, 1543, 1636, 1686, 1693–96, 1712–15, 1719, 1727, 1731–34, 1746, 1750–52, 1754, 1759–61, 1803, 1825, 1830, 1856–59. In 1873–74 small numbers appeared in swarms about Genshagen, near Berlin; they laid their eggs, and in the middle of June, 1875, the larvæ appeared in millions, becoming fledged in July. Köppen has published an elaborate memoir on the migratory locust of southern Russia, and comes to the conclusion that *pachytylus migratorius* and *P. cinerascens* are only varieties of the same species, and that another genus, *œipoda*, is the same also. The form which he met with as most abundant in southern Russia is the true *pachytylus migratorius*. He describes minutely the development of the insect, the eggs of which are deposited in little nests of 60 to 100 together, surrounded by a membranous envelope. The eggs are laid in the autumn and hatched in the following spring. Köppen says the larvæ molt four times, the fourth molt producing the winged insect. The eggs taken from the ground showed the eyes, antennæ, segments, and legs of the larvæ distinctly. A little while before hatching, the larva might be seen moving within the egg. He notices the *caloptenus italicus*, the congener of the American *caloptenus spretus*, as occurring in southern Russia. Other locusts which are occasionally devastating are *pachytylus stridulus*, *œdipoda devastator*, *stauronotus vastator*, *S. cruciatus*, and *pezotettix alpina*.

The genus to which the principal species of locusts of the United States belong is *caloptenus*, and it comprises 29 species, as described by various authors, but it is thought that several of these upon further examination will be found mere varieties of closely allied species. Of these nearly all are local, and not greatly destructive; for instance, *C. floridans* has been found only in Florida; *C. griseus*, only in Ohio; *C. repletus* and *C. scriptus* only in the n.w. portion of Washington territory, and others in other regions. Only three species are so nearly allied as to require careful examination for their distinction from one another; viz., the Rocky-mountain locust, *caloptenus spretus;* the lesser locust, *caloptenus atlanis*, of the eastern states as well as western states and territories; and the red-legged locust, *caloptenus femur rubrum*. Some of the general characteristics of the genus caloptenus are as follows: head subglobular, front vertical or nearly so; vertex narrow between the eyes, being a little less than the eye itself; sides parallel, flat or slightly concave, and nearly perpendicular; dorsal surface nearly flat; the elytra and wings extend to or beyond the tip of the abdomen, the elytra being narrow, with one exception (*C. bivitatus*), and the wings transparent in all the American species, with sometimes a bluish tinge. Abdomen usually subcylindrical, having no distinct keel above; that of the male enlarged at the tip and curved upwards, the last segment being sometimes truncated, sometimes notched. Posterior thighs strong and much enlarged near the base; the external surface more or less convex, and in the female generally longer. Most of the American species have the upper portion of the inner face of the posterior thighs marked with three oblique dark bands, the one at the base less distinct; antennæ filiform and slender, much shorter than in the family *locustidæ* or so-called true grasshopper. The following are approximate measurements of the insect taken from an extensive table made by prof. Riley. Female: whole length to tip of elytra, $1\frac{1}{4}$ to $1\frac{1}{2}$ in., the elytra projecting from 0.13 to 0.28 in. beyond the tip of the abdomen. Length of male to tip of elytra, $1\frac{1}{16}$ to $1\frac{1}{8}$ in.; projection of elytra beyond abdomen, 0.2 to 0.3 inch. The species most closely allied to *C. spretus* of Thomas is *C. atlanis* of Riley, which is at once distinguished from *C. femur rubrum* by the notched last joint of the abdomen of the male, and by greater relative length of wings, which extend nearly

one-third their length beyond the tip of the abdomen in dried specimens, and also by the larger and more distinct spots on the wings. From both species it differs by its smaller size, and also by the more livid color of the dark, and paler yellow of the light, parts. Measurements of the male to tip of elytra, 0.84 to 0.93 to 0.95 to 0.98 to 1 inch. *C. femur rubrum* is larger than *C. atlanis*, but the elytra are shorter in proportion, sometimes in the female not reaching beyond the tip of the abdomen, the whole length to tip of elytra being from 1.04 to 1.22 inch. The *C. femur rubrum* is generally called the common red-legged locust, and *C. spretus* is known by the several names hopper, army grasshopper, red-legged locust, Mormon locust, western locust, hateful grasshopper, and Rocky-mountain locust, which latter is the most appropriate name. The history of the Rocky-mountain locust, the specially destructive species, is much like that of the old-world locust. It breeds over vast areas and often migrates in immense swarms for hundreds of miles beyond its usual habitat, but the American locust prefers rather cooler latitudes than the old-world insect, a large portion, nearly one-third, of its permanent breeding grounds lying in British America about the head-waters of the tributaries of lake Winnipeg. Not much can be said about the movements of the Rocky-mountain locust previous to 1864, and it is questionable by the commission whether it may not have increased in some regions since the settlement and improvement of the country, which has given them more subsistence. Neill's history of Minnesota mentions the invasion of that district of country by vast swarms of grasshoppers in 1818–19, which devastated the country and often covered the ground 3 or 4 in. deep, and in 1820 they ravaged the western counties of Missouri. In 1842 locusts again appeared in Minnesota and Wyoming, and in 1845 in Texas, and again in 1849. They have appeared in Utah from 1851 to 1877, except in 1873–74, and a portion of this territory forms one of the permanent breeding-grounds. From one year to another they have visited various portions of the territories and states. A notable locust year was 1866, when the insects swarmed over Kansas, Nebraska, the western counties of Missouri and n.e. Texas, and in Iowa, Minnesota, Colorado, and Utah. They often delayed the railroad-trains in these parts by lubricating the rails when crushed. In 1870 locusts were not plentiful, but in 1870–71 they began to increase, and in 1873 they again wrought serious ravages; but the most disastrous locust year which has been known in the country was 1874, vast destructive swarms invading settled portions of the Mississippi valley w. of the 94th meridian. Colorado, Nebraska, Kansas, Wyoming, Dakotah, Minnesota, Iowa, Missouri, New Mexico, Indian territory, and Texas were overrun by swarms from the n.w., from Montana and British America. The loss in this region was estimated at $50,000,000. In 1875 the young insects hatched in immense numbers over an area embraced by about 300 m. of latitude and 250 of longitude, embracing portions of Nebraska, Kansas, and Missouri, the two western tiers of counties of Missouri and the four tiers of counties in Kansas w. of Missouri suffered the most, about 750,000 people becoming destitute or suffering. In Missouri alone prof. Riley estimates the loss to have been $15,000,000. In Mar., 1877, prospects were bad, but there was an unusual rain-fall in April, May, and June, and much of the country along the Missouri river was flooded, and the weather was cool over Colorado, northern Utah, Montana, and British America. The young insects died in vast numbers when they hatched, and few of them lived to acquire wings. South of 40° of latitude, late in May and early in June, they flew toward the n.w. to Dakotah and Montana, whence their progenitors came.

The permanent breeding-grounds of the Rocky-mountain locust were not defined until the U. S. entomological commission made their investigation. Vague ideas were entertained, and it was known that many of the swarms came from the n.w., but there was no definite information. It was ascertained that the area in which the locust breeds each year is about 300,000 miles. They do not cover this area in breeding, but may breed any year in any part of it. It is the permanent habitat, but the most favorite breeding-grounds within the area are the river-bottoms and sunny slopes of uplands, or the grassy regions among the mountains, rather than over the more elevated, dry, and bleak plains. In central Montana the breeding-grounds are in the valleys of the Yellowstone, the upper Missouri, Gallatin, Madison, and Jefferson rivers and the grassy plains along their tributaries. These levels lie below 6,000 ft., mostly between 3,000 to 5,000 feet. The permanent area principally lies e. of the main Rocky-mountain range, between meridians 102 and 114 w. of Greenwich and between lat. 40° and 50° north. Farther w., between lat. 42° and 45° and long. 114° and 118°, there is a strip of 60 m. wide by 200 long at the head-waters of the Snake river, a tributary of the Columbia, which is a permanent breeding-ground. A subpermanent region, in which the insects breed more or less continuously, extends to the e. of the permanent region from 200 to 400 m., between parallels 39° and 53° of latitude. A temporary region extends to the valley of the n. Mississippi, passing through the states of Minnesota, Iowa, Missouri, and the north-western counties of Arkansas, and through Texas to the gulf of Mexico, thence n.w., passing through New Mexico, Arizona, Nevada, thence n. through Oregon and Washington territories to the main Rocky-mountain range in lat. 49°.

The locust is the only truly migratory insect, although swarms of butterflies have been known to fly short distances in the Mississippi valley. The locusts of the old world have been known to fly into central Europe from their permanent breeding-grounds in central Asia. In North America they often extend their flights over a distance of 1000 to

2,000 m., or from Montana to Missouri, and even to Texas. The flight generally takes place during the day, commencing early in the forenoon and ending for that day at about five o'clock in the afternoon. The rate of travel varies from 3 to 20 m. an hour, depending on the wind. Sometimes those which commence to fly in Montana the middle of July may not reach Missouri till Aug. or the fore-part of September. The swarms are designated, according to their origin and direction, *invading swarms*, or those which come in vast numbers from their permanent breeding-grounds; *returning swarms*, or those which, having hatched in an invaded district, return, as by instinct, to the permanent breeding-grounds; and *local flights*, or those to-and-fro movements of insects hatched in an invaded district.

The height in which the migrating swarms move has been the subject of observation, and differs according to locality, vastness of numbers, and direction and height of air-currents. The signal-service officer at Bismarck observed a swarm moving above the cumulus clouds. One observer states that in 1868, when upon the snowy ranges e. of Middle park, and on Long's peak, there were daily flights of full-grown grasshoppers as far as the eye could reach from the loftiest summits. Another, from Parry's peak, in 1872, speaks of them as filling the air like snow-flakes, far above the summit, 13,333 feet. It has been observed that a sudden change of wind generally brings a flying swarm to the ground. When the wind returns to the direction in which they were going they will again rise and pursue their flight. Repeated observations have confirmed this statement. A fall of temperature always brings a swarm to the ground, and this is thought to be the chief reason of their alighting in the evening. Flights, however, have been known to take place at night, or to continue during the night when the weather is warm. The opinion has been formed by some that the locust has but little power of flight except when aided by the wind, while others think it capable of sustained flight even against a gentle wind. The truth lies between these extreme views. The migratory locust has considerable power of flight for so small an animal, but would make comparatively little progress, and not prove to be the devastator that he is except for the wind. It has been observed that locusts are most numerous, whether by immigration or otherwise, in warm, dry seasons. Cold and wet prevent hatching, and do great injury to the young that are hatched.

Destructive Power of Locusts.—Prof. Riley remarks: "No one who has not witnessed the ravaging power of locusts can fully conceive of or appreciate it. Muscular, gregarious, with powerful jaws and ample digestive and reproductive systems; strong of wing, and assisted by numerous air-sacs that buoy—all these traits conspire to make it the terrible engine of destruction which history shows it to have been under conditions favorable to its excessive multiplication. Insignificant individually, but mighty collectively, locusts fall upon a country like a plague or a blight. The harvest is at hand; the day breaks with a smiling sun, and all the earth seems glad. Suddenly the sun's face is darkened and clouds obscure the sky: the day closes, and ravenous locust swarms have fallen upon the land. The morrow comes: the fertile land of promise and plenty has become a desolate waste, and the sun shines sadly through an atmosphere alive with myriads of glittering insects. Falling upon a corn-field, they convert in a few hours the green and promising acres into a desolate stretch of bare, spindling stalks and stubs. Their flight may be likened to an immense snow-storm extending from the ground to a height at which our visual organs perceive them only as minute, darting scintillations, leaving the imagination to picture them in indefinite distances beyond. When on the highest peaks of the Snowy range, 14,000 or 15,000 ft. above the sea, Mr. Byers has seen them filling the air as much higher as they could be distinguished with a good field-glass. It is a vast cloud of animated specks glittering against the sun. On the horizon they often appear as a dust-tornado, riding upon the wind like an ominous hail-storm, eddying and whirling about like the wild dead leaves in an autumn storm, and finally sweeping up and past you with a power that is irresistible. They move mainly with the wind, and when there is no wind they whirl about in the air like swarming bees. If a passing swarm suddenly meets with a change in the atmosphere, such as the approach of a thunder-storm or a gale of wind, they come down precipitately, seeming to fold their wings, and fall by the force of gravity, thousands being killed by the fall, as if upon stone or other hard surface. Col. H. McAllister, of Colorado Springs, Col., in 1875 saw a swarm suddenly come down in that place with a rain. 'The ground was literally covered 2 or 3 in. deep. In rising the next day, by a common impulse they would circle in myriads about you, beating against everything animate and inanimate, driving into open doors and windows, heaping about your feet and around your buildings, their jaws constantly at work biting and testing all things in seeking what they might devour. In the midst of the incessant buzz and noise which such a flight produces, in the face of unavoidable destruction everywhere going on, one is bewildered and awed at the collective power of the ravaging host, which calls to mind so forcibly the plagues of Egypt. The noise which their myriad jaws make when engaged in their work of destruction can be realized by any one who has fought a prairie-fire or heard the flames passing before a brisk wind.'" The eggs are laid in many kinds of soil, because choice cannot always be made by such almost illimitable hosts. Dry meadows, pastures, bare sandy places, and roadsides are overrun with the procreating swarms. The female when about to lay her eggs forces a hole in the ground by means of the two pairs of horny valves

which open and shut at the tip of her abdomen, and which from their peculiar structure are admirably fitted for the purpose. With the valves closed she pushes the tips into the ground, and by a series of muscular efforts and continued opening and shutting of the valves she drills a hole until, in a few minutes, the whole abdomen is buried. The abdomen stretches to its utmost for this purpose, especially at the middle, and the hole is generally a little curved and always more or less oblique. Now with the hind legs hoisted straight above the back, and the shanks hugging more or less closely the thighs, she commences ovipositing. When the hole is once drilled there exudes from the tip of the body a frothy mucous matter which fills up the bottom of the hole and bathes the horny valves. This is the sebific fluid which is secreted by the sebific or cement gland. An egg is laid and deposited in its place by a piece of admirable apparatus. Then follows a period of convulsions, during which more mucous material is elaborated until the whole end of the body is bathed in it, when another egg passes down and is placed in position. These alternate processes continue until the full complement of eggs is in place, the number ranging from 20 to 35. The mucous matter binds all the eggs in a mass, and when the last is laid the mother devotes some time to filling up the somewhat narrowed neck of the burrow with a compact and cellular mass of the same material, which, though light and easily penetrated, is not easily permeable by water and forms an excellent protection. The examination of one of these egg-masses is full of interest. No more perfect arrangement is found in a bee-hive; the eggs are arranged in perfect order, having a beautiful spiral appearance in one aspect and showing a quadrangular arrangement in another. The time for drilling the hole and completing the process of making the egg-mass varies with the weather, in the warmest days taking from 2 to 3 hours, but longer when the mornings and evenings are cool. The ground is often covered by the egg-laying females during the day. It has been thought by some that when the young begin to migrate they are led by kings or queens, and this idea has been formed from seeing a few members of a larger genus of *acridium* (*A. Americana*) with them, and also the coral-winged locust.

The Rocky-mountain locust takes about seven weeks from the time of hatching to attain its full size. As the transformations in the orthoptera are incomplete, there is very little difference in the general appearance of the body, except in size, between the young and the adults. The most noticeable difference is the want of wings in the young, as well as the narrower prothorax. The complete development is accomplished through a series of five molts, during the first four of which the wing-pads become more and more apparent, and during the fifth the insect more rapidly gets its full wings and ceases growing. The first three of the larval skins are shed on or near the ground, under the grass or other cover, and their dry, cast-off shells are often mistaken for dead locusts. The last two molts are made while the insect fastens itself to some elevated object. Mr. Riley says: "When about to acquire wings the pupa crawls up some post, weed, grass-stalk, or other object, and clutches it securely with the hind-feet, which are drawn up under the body. In doing so the favorite position is with the head downwards, though this is by no means essential. Remaining motionless in this position for several hours, with antennæ drawn down over the face and the whole aspect betokening helplessness, the thorax, especially between the wing-pads, is noticed to swell. Presently the skin along this swollen portion splits right along the middle of the head and thorax, starting by a transverse, curved suture between the eyes and ending at the base of the abdomen. As soon as the skin is split the soft and white fore-body and head swell and gradually extend more and more by a series of muscular contortions; the new head slowly emerges from the old skin, which, with its empty eyes, is worked back beneath, and the new feelers and legs are being drawn from their casings, and the future wings from their sheaths." This all occupies about 15 minutes, and the newly formed insect now turns round and clambers up the cast-off skin, and there rests while the wings expand and every part of the body hardens and gains strength. In 10 or 15 minutes from the time of extrication the wings are fully expanded, and hang down like dampened rags. From this point on the broad hind-wings begin to fold up like fans beneath the narrower front ones, and in another 10 minutes they have assumed the normal attitude of rest. Without careful inspection one would be puzzled to know how the now stiff legs had been drawn out of their old cases; but they were exceedingly flexible and capable of bending at every part over the flexed knee-joint of the case. The whole operation, from the bursting of the skin to the full development of wings, occupies from one-half to three-quarters of an hour.

The locust has many enemies, or animals that prey upon it. One of the most remarkable is the *anthomyiæ angustifrons*, or egg-parasite, the most widespread of all the egg-feeders. In 1876 this parasite destroyed about one-tenth of all the eggs laid in Missouri, Kansas, and Nebraska; many were seen also in Iowa, Minnesota, Colorado, and Texas. The larva of this insect is a little less than a quarter of an inch long, and sometimes a dozen or more are found in the same locust-egg-pod, where they suck the juices of the eggs. The winged insect is about the length of the larva, with a spread of wing about twice as great. The larvæ of the common flesh-fly also feed upon locust-eggs, and many species of ground-beetles also feed upon them, sometimes settling in swarms in fields where locust-eggs have been laid, and often completely devouring them. They also devour the full-grown locusts. The locust mite (*trombidium locustarum*,

Riley) preys upon the adult locust. In the spring the female of this parasite lays from 300 to 400 minute eggs about 2 in. beneath the surface of the ground in the locust-fields. Minute orange-colored mites hatch from these eggs, crawl upon the locusts, and fasten themselves at the base of the wings. The digger-wasps (*larada semirufa*) also catch locusts, sting them, and bury them in their nests for the sustenance of their newly hatched young. But the birds are the great natural destroyers of the locusts, and flocks of them have been known to clear a field in a few minutes. See INSECTIVOROUS BIRDS.

Various methods have been devised by the farmers to destroy locusts or prevent their depredations. One method which has been successfully practiced to save a small crop is to drag ropes over the surface of the grain, repeating the operation until the insects are driven to other parts. The encouragement of the fly-catching birds is one of the effective measures, and the commission advise the offering of rewards for hawks. This has been done with beneficial results in Colorado and other states. The destruction of the eggs may be accomplished on a great scale by harrowing, plowing, and irrigation, the latter method sometimes being much the most economical. Young locusts, before they are winged, may be destroyed by burning the fields when this is feasible. The older locusts are destroyed in various ways by different kinds of apparatus. Some crush them between rollers, some gather them in nets, bags, and other receptacles mounted on wheels and pushed about by hand or driven by horse-power. One of the most efficient pieces of apparatus is the coal-tar pan, known as "Robbins's hopperdozer."

General Anatomy.—This has much in common with other insects, but the proportions vary. A superficial inspection of the locust will show that its body is covered with a hard, articulated shell which protects the internal organs, the articulations having the general form of rings, many of which are again subdivided into pieces. There are 17 of these rings or segments, disposed in three regions, four segments composing the head, three the thorax, and ten the abdomen. The legs consist of five well-marked joints, the tarsi or feet having *three* joints, and the third joint having two large claws, with a pad between them. The so-called true grasshoppers have tarsi with four joints, and also shrilling organs at the base of the wings, which the locusts have not. The hind-legs, especially the thigh and shank, are very large and well adapted to hopping. The sternum is broad and large. The head in the adult locust is chiefly composed of a single piece called the epicranium, and carries the compound eyes, the ocelli or simple eyes, and the antennæ. While there are in reality four primary segments in the head of all winged insects, corresponding to the four pairs of appendages in the head, the posterior three segments, after early embryonic life in the locust, come to be represented only by their appendages and small portions to which the appendages are attached. The epicranium represents the antennal segment, and most of the piece represents the tergum, or upper portion of the segment. The antennæ, or feelers, are situated in front of the eyes, and between them is the anterior ocellus, while the two posterior ocelli are situated above the insertion of the antennæ. In front of the epicranium is the clypeus, a piece nearly twice as broad as long, and to this is attached a loose flap covering the jaws when they are at rest. This is the upper lip or labrum. There are three pairs of mouth appendages: 1, the true jaws or mandibles, situated on each side of the mouth; 2, the maxillæ, divided into three lobes, the inner armed with spines, the middle unarmed and spatula-shaped; while, 3, the outer lobe is a five-jointed feeler, called the maxillary palpus. The floor of the mouth is formed by the labium, which is composed of two second maxillæ, fused together in the middle line. Within the mouth the tongue is placed upon the labium, and is a large, membranous, hollow expansion of the latter organ (Packard). The internal anatomy of the locust is really marvelous, although not very complex. The esophagus terminates at the center of the head, where the crop commences, and where there is a slight constriction with oblique folds armed with spine-like teeth. After leaving the head the folds in the crop become longitudinal, upon which the teeth are arranged in rows, each row, composed of groups of from three to six teeth, pointing backward, so as to push the food into the stomach. It is in the crop that the substance known as "molasses" is produced, and which is the partly digested food, mingled with the secretion of the crop. The true or chyle stomach commences a little behind the insertion of the middle pair of legs. It is paler than the crop, which is of a flesh color. Between the crop and stomach, externally, there are six remarkable organs, called gastric cæca. They are of a sacculated, spindle shape, placed longitudinally side by side, surrounding the posterior part of the crop and the anterior part of the true stomach, and when dilated touching each other at the middle. The anterior ends are attached to the latter third of the crop, while the posterior and more pointed extremities float freely in the body cavity, and pour into it the chyle of the stomach, insects having no system of lacteal vessels. These cæca are true dilatations of the chyle stomach. The uriniferous tubes are situated at the junction of the posterior extremity with that portion of the intestinal canal called the ileum. These tubes are arranged in 10 groups of about 15 tubes each, which, when stretched out, are about as long as the body, and are convoluted around the alimentary canal. There is an ileum, a colon, and a rectum, the latter having six large rectal glands on the outside, held in place by six muscular bands. The nervous system of the locust consists of a series of nerve-centers connected by bands. These centers or ganglia are: 1, supra-esophageal gan-

glion, or brain, which furnishes the eyes and the ocelli with nerves; 2, infra-esophageal ganglion; 3, three thoracic ganglia connected by double cords; and 4, five abdominal ganglia connected by single medial cords. There is also a sympathetic system, composed of three principal ganglia, and a not otherwise complex system of nerves. The respiration is much like that in other insects. See INSECTS. In the female the ovaries, immediately before ovipositing, occupy a considerable portion of the abdomen, and consist of two masses of tubes, with air-sacks and tracheæ ramifying among them. There are from 17 to 22 tubes in each ovary in *C. femur rubrum*, and more in *C. spretus*, sometimes as many as 50 in each, or 100 in both. Indeed, the mouth, crop, stomach, and reproductive system of the migratory locust may be said to practically occupy the whole of the body cavity, the whole physical energy being spent in devouring and multiplying. As to the organs of sense they have two large, well-developed compound eyes, and three ocelli or simple eyes, which, no doubt, very well serve the purpose of vision. The antennæ are probably organs of taste as well as of touch, but it is not known whether the tongue has any gustatory sense. The ears are well developed, and there is no doubt but that the sense of hearing is acute from the fact that drums and kettles are efficient means of disturbing these insects.

LOCUST TREE, a name given in different parts of the world to different trees of the natural order *leguminosæ*.—The carob tree (*ceritonia siliqua*) is often so called in the countries bordering on the Mediterranean, and its pods are the locust beans of our shops. See CAROB. A kind of effervescing beer, made from locust or carob pods, has been sold in London.—The LOCUST TREE of America (*robinia pseudacacia*), also called the FALSE ACACIA, or THORN ACACIA, and on the continent of Europe and in Britain, very generally the ACACIA, is a valuable and extremely beautiful tree. See ROBINIA. The wood, known as *locust wood*, is useful for all purposes in which great strength, and especially toughness, is required; this latter quality, which it possesses pre-eminently, makes it very valuable for trenails used in ship-building, and large quantities are imported for this purpose. It is also valuable for making the cogs of wheels.—The HONEY LOCUST (q.v.) TREE of America is a *gleditschia*.—The LOCUST TREE of the West Indies is *hymenæa courbaril*, a gigantic tree, whose pods also supply a nutritious matter, a mealy substance in which the pods are imbedded. It is sweet and pleasant, but apt to induce diarrhea when recently gathered, which property, however, it loses when kept for a short time. A decoction of it, allowed to ferment, makes a kind of beer. The bark of the tree is anthelmintic; it yields a kind of resin called anime (q.v.), and it is valuable as a timber-tree, the timber (also known as *locust wood*) being close-grained and tough, and in request in England for trenails. It is very generally imported in the form of trenails.

LODE, a miner's term for veins (q.v.) in which minerals occur. They are crevices, more or less vertical, produced by contraction, or the mechanical disturbance of the rock, which have subsequently been filled with metallic ores.

LODÈVE (ancient *Luteva* in *Gallia Narbonensis*), a t. of southern France, in the department of Hérault, situated on the Ergue, in a beautiful valley, 32 m. n.w. of Montpellier. It is inclosed by walls, has a cathedral, with manufactures of woolen cloths. Pop. '76, 10,198. Lodève is the birthplace of cardinal Fleury.

LODGE, THOMAS, 1556–1625; b. Lincolnshire, Eng.; studied at Oxford, but left without taking a degree, and went to London; became an actor and began to write for the stage about 1580, producing his *Defense of Stage Plays*. In 1584 he studied law at Lincoln's inn, and soon after accompanied Clarke and Cavendish as a soldier on their expeditions. Some time afterwards he studied medicine, and took a degree at Avignon. Returning to London he practiced with success, and published in 1603 a *Treatise of the Plague*. As a dramatist he occupies a high rank. His extant plays are: *The Wounds of Civil War lively set forth in the True Tragedies of Marius and Sylla; A Looking-glass for London and England*. In 1819 a collection of his pastoral and lyric poetry was published. His novel *Rosalynde: Euphues Golden Legacie*, found in his cell after his death at Silexedra, gave Shakespeare the framework of the plot in his *As You Like It*. In its prose descriptions and narratives, as well as in the interspersed verses, the novel is often finely poetical. *A Margarite of America*, written probably during his voyage with Cavendish, was published in 1596. He translated Josephus and Seneca. While a student at Lincoln's inn he published *Alarum against Usurers*. He is said to have died of the plague.

LODGED, in heraldry. A beast of chase, as a stag, is said to be lodged when lying down with its head erect; a beast of prey in the same position is said to be couchant.

LODGING-MONEY is an allowance, in the British army, granted to officers and others, for whom suitable quarters cannot be provided in barracks. Married sergeants and private soldiers who are married "with permission," are entitled to lodging-money at various rates up to 8s. a week, when separate rooms in barracks cannot be spared for the accommodation of each couple. The total charge for lodging-money in the army estimates amounts to about £100,000.

LODGINGS, or the use of part of another person's house, when occupied, constitute the relation of landlord and tenant between the parties. Lodgings being generally taken by the week, or month, or quarter, it is not necessary that the contract should be

by writing, though it is expedient, especially where any particular stipulations are made. But where a furnished house is let, and a written agreement or lease is used, it is absolutely necessary that there should be a stamp on such writing, which must be canceled by the parties under a penalty of £5 besides stamp-duty; and house-agents who let furnished houses above £25 for hire, must now take out an annual license, and pay duty. In England, the chief points of law which arise are as follows: One of the risks which the lodger runs is that, if his landlord, L, is himself a tenant to A, somebody else, then, if L's rent is in arrear, the lodger's goods may be taken by A to pay this, for the rule is, that all goods found on the premises, to whomsoever belonging, may be seized to pay arrears of rent, and it is immaterial whether the landlord A, who distrains, knows they are not L's, but the lodger's goods. The only remedy in such a case for the lodger is to deduct the amount of loss from the next rent he pays to L for lodgings. Hence, in order to learn whether the above risk is impending, a lodger frequently inquires beforehand at the landlord of the house, A, and the tax collectors, whether rent, etc., is in arrear. A lodging-house keeper, even where he keeps a boarding-house, which nearly resembles an inn, is not liable for the safe custody of the lodger's goods. He is merely liable for ordinary care; but he does not warrant at all hazards that the goods will not be stolen, as an innkeeper (q.v.) does. Even if the lodger's goods are stolen by a servant of the house, the lodging-house keeper is not liable. The notice to quit depends on how the lodgings were taken. If they were taken by the week, a week's notice is sufficient; if by the month, a month's; and if by the quarter, a quarter's notice, unless some other agreement was made. Hence, if the lodger quit without notice, he is liable for one week's, or month's, etc., rent, even though the landlord put a notice in the window. The lodging-house keeper may distrain the lodger's goods for unpaid rent. When a lodger refuses to quit the lodgings after a notice has expired, he cannot be put out by force, but in many cases a summary remedy is given for recovering possession. In Scotland, the lodger's goods cannot be taken by the landlord of the lodging-house keeper for rent. A lodger, whatever rent he pays, yet not being rated to the poor, etc., is not entitled to vote for members of parliament; though it is said that in Scotland a different practice prevails in some places (Burton's *Law of Scotland*, 38). *Common lodging-houses*, where poor people lodge by the night, have recently been subjected to state interference; and by statutes 14 and 15 Vict. c. 28, and 16 and 17 Vict. c. 41, the keepers of such lodging-houses must register them. They are liable to be inspected by an officer of the board of health for sanitary purposes, and the keepers are bound, on notice, to report to the local authority every person who resorted to their houses during the preceding day or night. The keepers are bound to thoroughly cleanse all the rooms, stairs, etc., as often as by-laws shall direct, and to keep a proper supply of water. If fever break out, notice must be given to the local authority. These duties are enforced by means of penalties. These statutes were extended to Ireland by the statutes 23 and 24 Vict. c. 26.

LO'DI, a flourishing t. of north Italy, in the province of Milan, stands on the right bank of the Adda, 19 m. s. of Milan, on a gentle slope in the midst of a highly fertile district, and contains 20,000 inhabitants. It is protected by walls and a strong castle, erected by the Visconti, but lately appropriated as a military hospital. Lodi is a bishop's see and the seat of a college, and contains many fine buildings. Its chief manufactures are linens, silks, chemical products, and Majolica porcelain, for which it is famous. Its great trade is in cheese, especially the famous species known as Parmesan, which, instead of being manufactured at Parma, as one might infer from the name, is exclusively made in the vicinity of Lodi, where 80,000 cows are kept for the purpose.—LODI VECCHIO, or Old Lodi, is a ruined village about 5 m. w. of the modern town; it was founded by the Boii, and colonized by the father of Pompey the great, hence its name, *Laus Pompeia*, which was gradually corrupted into the modern name of *Lodi*. Lodi is celebrated for the victory of the French, under Bonaparte, over the Austrians, on May 10, 1796, when the long and narrow bridge was carried by the French columns, notwithstanding a tremendous fire from the Austrian batteries.

LODOME'RIA, the Latin name of a principality annexed by Russia in the 11th century. At the partition of Poland, 1772, Austria gave the name Galicia and Lodomeria to her share of the spoils, though Russia retained the old province of Lodomeria.

LODZ (Russ. *Lodsi*), a t. of Poland, in the government of Piotrkow, and 75 m. s.w. from Warsaw. It is situated in a level fertile country, on a small feeder of the Ner, a branch of the Vistula. After Warsaw itself, Lodz is the largest town in Poland, and is remarkable for the activity with which different branches of industry are prosecuted, particularly the manufacture of cloth and other woolen stuffs. There is also a considerable trade, which is likely to be much promoted by a branch railway opened in 1865, connecting Lodz with the great Warsaw and Vienna line. The inhabitants of Lodz are mostly Germans, or of German origin. Its population has of late increased with great rapidity. At the beginning of the 19th c., the town had only a few hundred inhabitants; in 1854, the pop. had increased to 23,302; in 1860, to 31,564; and in 1867 it had risen to 34,328.

LO'ESS, a loamy deposit of pleistocene age, occurring in the valleys of the Rhine and the Danube. It consists of a pulverulent loam of a yellowish-gray color, made up prin-

cipally of argillaceous matter, combined with a sixth part of carbonate of lime, and a sixth of quartzose micaceous sand. In the Rhine, it apparently once covered the whole valley and its tributaries, reaching to a considerable height up the bounding mountains. It has subsequently been greatly abraded, a fringe only of the deposit being left on the mountain-sides, and occasionally some outliers in the widest parts of the valley; the materials have been carried down by thê river, and rearranged, as a newer loess or alluvium, in Belgium and Holland. This continuous deposit of fine sediment suggested the notion to the original observers of an enormous lake, whose barrier was at the narrow gorge of the Rhine at Bingen. But the loess occurs further down; besides the contained fossils are not lacustrine, but those of land-animals (*elephas* and *rhinoceros*), and land-shells (*helix*, *pupa*, and *succinea*). It is now believed to be the moraine mud of the Alpine glaciers, which was spread out gently in the valleys of the Rhine and Danube, as the land gradually emerged from the sea. The loess is generally from 30 to 50 ft. in thickness, though sometimes as much as 200 feet. Fossils are not generally distributed in the strata, but they are sometimes locally abundant. They consist chiefly of land-shells of species now inhabiting the same region.

LOFO'DEN, LOFFO'DEN, or LOFO'TEN, a chain of islands on the n.w. coast of Norway, between lat. 67° and 69° 15′ n., and stretching s.w. and n.e. for 175 miles. The largest of the islands are Hindöe, Andöe, and Langöe, Ost Vaagen, West Vaagen, and Flagstadöe. All of them are rugged and mountainous; indeed, some of the eminences in Vaagen attain an altitude of 4,000 ft., and are covered with perpetual snow. The glens near the coast possess a temperature mild enough to allow of the cultivation of oats, barley, and potatoes. The permanent pop. is estimated at 4,000. The islanders chiefly depend upon the fishery which was established some time previous to the 11th c. and has always attracted a large number of the inhabitants of the mainland. The average number of boats is 4,000, manned by 20,000 fishermen; and the produce of the cod-fishery is estimated at 9,000 tons of dried fish, 22,000 barrels of oil, and 6,000 barrels of roe. After the cod-fishery has terminated (in April), the herring-fishing season comes on, and continues throughout the summer, forming also an important branch of national industry. Several other kinds of fish are caught, and lobsters and oysters in abundance. The fishing is attended with considerale danger, on account of the sudden and violent storms from the w., and of the strong currents which set in between the islands. See MAELSTROM. The inhabitants are a mixed race, partly of Scandinavian, partly of Lappish descent.

LOFTUS, WILLIAM KENNETT, 1820–58; b. England. From 1849 to 1852 he was a resident of Turkey, and, devoting himself to archæology, made extensive explorations on the sites of the ancient cities on the Tigris and Euphrates. He made renewed examinations in the same field under the auspices of the Assyrian society of London in 1853, and a few years later published a volume of his *Travels and Researches in Chaldea and Susiana*, with illustrations. His contribution of specimens of ancient Assyrian sculpture to the British museum are highly valued.

LOG is the instrument by which a ship's rate of motion through the water is measured. Its simplest form is a triangular piece of light wood, leaded so as to swim vertically; this is connected with the log-line so that its flat surface is at right angles to the ship's course. When thrown out—attached to the log-line (see KNOT)—the log meets with such resistance that it theoretically remains stationary in the water, and the log-line passing freely out shows the speed of the vessel. There are, however, many improved logs, which have complicated apparatus, for marking the way made, changes of direction, etc. The log and line are known to have been used as early as 1570 A.D., and were alluded to by Bourne in 1577. Computing by the log is an uncertain operation, allowance having to be made for numberless contingent circumstances. In ships of war, it is usual to heave the log every hour; in merchantmen, every two hours. The *log-board* is a board on which the hourly results of the log-heaving are recorded in chalk, with the wind's direction, and other particulars, for the guidance of the officer in charge. The contents of the log-board are entered daily in the *log-book*, with all particulars essential to the history of the voyage, as ships spoken, icebergs seen, land sighted, etc. The *log-book* thus becomes a rough journal; and it is compulsory upon every master of a vessel to keep it properly, and to have it ready for inspection by any ship of war of his own nation whose captain may require its production.

LOGAN, a central co. of Dakotah; 1800 sq.m.; formed since the census of 1870. It includes a large portion of the *Plateau du Coteau du Missouri*, elevated prairie land, dry and thinly settled, lying between 98° and 99° w. long., and 45° and 48° n. lat.

LOGAN, a central co. of Illinois, 574 sq.m.; pop. '80, 25,041; watered by Salt, Kickapoo, and Sugar creeks. It is traversed by the Pekin division of the Wabash, and the Chicago and Alton, and Gilman, Clinton and Springfield railroads. The soil is very fertile, mostly prairie land; productions: wheat, oats, hay, cattle, and pork. In 1870 this county produced 4,221,640 bushels of Indian corn, being more than any other county in the United States, except Sangamon co. in the same state. Timber is very scarce, but there is an abundance of coal. Co. seat, Lincoln.

LOGAN, a co. in Kentucky, immediately s. of the Tennessee state line; 600 sq.m.; pop. '80, 24,358; traversed by the Memphis, Clarksville and Louisville railroad. The surface is varied, the soil fertile; productions: tobacco, wool, cotton, and grain. Co. seat, Russellville.

LOGAN, a w. central co. in Ohio; 415 sq.m.; pop. '80, 26,628; undulating surface and productive soil. Live stock, wool, and grain are the most important productions, and there are manufactures of flour, furniture, lumber, etc. The Cincinnati and Sandusky, and the Cleveland, Cincinnati and Indianapolis railroads traverse this county. Co. seat, Bellefontaine.

LOGAN, a co. in West Virginia, n.e. of the Kentucky line, from which it is separated by a fork of the Big Sandy river; 825 sq.m.; pop. '80, 7,329; watered by the Guyandotte river. The surface is varied, chiefly hilly, and the soil is productive. This county possesses great mineral wealth, yielding coal and iron, salt and petroleum. Co. seat, Logan Court-House.

LOGAN, 1720–80; the name adopted by the Indian chief Tah-gah-jute, in honor of his friend gov. Logan of Pennsylvania. Prior to 1770 he lived in Pennsylvania, where his father, a chief the Cayugas, had lived before him. He was well known on the Pennsylvania and Virginia frontier, a brave chief, of noble presence, always friendly to the whites, and endeared to them by his many good qualities. In 1770 he removed to the shores of the Ohio river with his family, and there fell into intemperate habits. In 1774 Logan's family were murdered by a marauding band of whites. This cruel and cowardly act roused the chief to a determination for vengeance, and he devoted himself to stimulating the tribes to rise against the white settlers. In this he was completely successful, and a savage war began, which lasted six years, with the most terrible cruelties, in the performance of which Logan himself was pre-eminent. He is said to have taken thirty scalps with his own hands. The war closed with the defeat of the Indians, but Logan refused to join the other chiefs in begging for peace with the whites. Instead of any such act of submission, he sent an address to lord Dunmore, governor of Virginia, first published by Thomas Jefferson in his *Notes on Virginia*. Its authenticity has been questioned, but it has popularly been accepted as a genuine instance of Indian eloquence. Although often reprinted in school readers and other ephemeral works, it is sufficiently characteristic and pertinent to deserve permanent preservation. "I appeal to any white man to say if ever he entered Logan's cabin hungry, and he gave him not meat; if ever he came cold and naked, and he clothed him not. During the course of the last long and bloody war Logan remained idle in his cabin, an advocate for peace. Such was my love for the whites that my countrymen pointed as they passed, and said, Logan is the friend of the white man. I had even thought to have lived with you, but for the injuries of one man. Col. Cresap, the last spring, in cold blood and unprovoked, murdered all the relations of Logan, not even sparing my women and children. There runs not a drop of my blood in the veins of any living creature. This called on me for revenge. I have sought it; I have killed many; I have fully glutted my vengeance. For my country I rejoice at the beams of peace. But do not harbor a thought that mine is the joy of fear; Logan never felt fear. He will not turn on his heel to save his life. Who is there to mourn for Logan? Not one." It is doubted if the officer to whom Logan refers was concerned in the massacre of his family. The chief now fell a complete victim to intemperance, became quarrelsome and dangerous, and was eventually killed by a relative in self-defense.

LOGAN, Cornelius A., b. Baltimore, 1800; of Irish descent; after sailing as supercargo, became a journalist, then an actor and dramatist. He had three daughters, Olive, Eliza (Mrs. Geo. Wood, 1830–72), and Cecilia, all actresses of talent; of whom the first is also a lively writer. A poem entitled *The Mississippi* was one of Mr. Logan's well-known productions.

LOGAN, George, 1753–1821; b. Stenton, Penn.; educated in England, and after three years' study at the medical school in Edinburgh made the tour of Europe. Returning to America in 1779, he spent some time in applying science to agriculture, and subsequently was a member of the legislature for several terms. At the commencement of the French revolution he joined the party of Jefferson and the republicans against the federalists. In 1798 he went to Europe as a private citizen to use his influence to prevent a threatened war between France and the United States, having received letters of introduction from Jefferson instead of passports from the secretary of state. Though successful in inducing the French government to annul the embargo on American shipping, and in preparing the way for a negotiation resulting in peace, he was denounced as the treasonable envoy of a faction by the federalists, who afterwards had an act passed by congress, called the *Logan act*, making it a high misdemeanor for a private citizen to interfere in a controversy between the United States and a foreign country. He was a member of the U. S. senate 1801–7, and in 1810 went as a volunteer to England for the purpose of settling difficulties between Great Britain and the United States, but the mission was fruitless. He was a member of the philosophical society and of the board of agriculture. He published *Experiments on Gypsum*, and on the *Rotation of Crops*. In religion he was a member of the society of Friends.

LOGAN, JAMES, 1674–1751; b. Lurgan, Ireland, of Scotch Quaker stock; was well educated, and entered into business as a merchant; in 1699 accompanied William Penn to Pennsylvania, where he held various public offices, such as provincial secretary, chief-justice, president of council, acting governor, etc. He wrote *Experimenta de Plantarum Generatione*, a translation of Cicero's *De Senectute*, and other works in Latin and in English prose and verse. Died at Stenton, near Germantown.

LOGAN, JOHN, 1748–88; b. Midlothian, Scotland; educated at Edinburgh university, and settled as minister of Leith in 1773. His first literary work was a series of lectures on the philosophy of history, followed, in 1781, by a volume of hymns and odes. It is claimed that the *Ode to the Cuckoo*, by far the best of these, was stolen from the papers of Michael Bruce, a deceased friend. The other poems, however, possess some merit. They may be found in Anderson's collection. Of his tragedies, *Runnamede* (1783) is alone worthy of note. A review of the charges against Warren Hastings caused the prosecution of the author. Logan lost his position at Leith through his play-writing, and charges of immorality, and died in London. In 1790 a collection of his sermons was published. They have great vigor and earnestness.

LOGAN, JOHN A., b. Jackson co., Ill., 1826; received a limited common-school education; at the outbreak of the war with Mexico enlisted as a private, but became quartermaster of his regiment, with the rank of first lieut.; after the close of the war was elected clerk of the court of his native county; in 1852 graduated at the Louisville university, and afterwards was admitted to the bar; was a member of the state legislature in 1852–53 and 1856–57, and prosecuting attorney from 1853 to 1857; was elected to congress in 1858 and again in 1860, resigning his seat in 1861 to enter the army. He was made colonel of the 31st Illinois volunteers, and led the regiment in the battles of Belmont and fort Donelson; was wounded in the latter engagement, and in Mar., 1862, was appointed brig.gen. of volunteers, and a few months later, maj.gen.; in the Vicksburg campaign was in command of a division of the 17th corps, distinguishing himself at Port Gibson, Champion hills, and in the siege and surrender of Vicksburg. In 1863 he was put in command of the 15th corps, which he led with valor until the death of McPherson, when he took command for a time of the army of the Tennessee. On being relieved by gen. O. O. Howard he returned to the command of his corps, which he led until the fall of Atlanta, when he obtained leave of absence to engage in the effort to re-elect Abraham Lincoln for president. He afterwards rejoined his corps, leading it in the march through the Carolinas, and until he succeeded gen. Howard in command of the army of the Tennessee. Having resigned from the army in Aug., 1865, he was in the following Nov. appointed minister to Mexico, but declined. He was subsequently elected to congress for two successive terms, and in 1871 to the senate of the United States, of which he is still (1881) a member. He is an earnest advocate of the principles of his party, and is a strong and ready speaker.

LOGAN, Sir WILLIAM EDMOND, LL.D., 1798–1875; b. Montreal, Canada; graduated at the university of Edinburgh in 1817, and in 1818 became partner in a mercantile house in London; 1829–38, manager of a mining enterprise at Swansea, Wales; in 1841 became head of the geological survey of Canada; represented that country in the expositions of 1851 and 1862 at London, and in that of Paris in 1853; was made a knight of the legion of honor in 1855, and a knight-bachelor by the queen in 1856. Died in Wales.

LOGANIA'CEÆ, a natural order of exogenous plants, consisting of trees, shrubs, and herbaceous plants, with opposite entire leaves, and usually with stipules, which adhere to the footstalks or form sheaths. The calyx is 4–5-partite; the corolla hypogynous, regular or irregular, 4–5- or 10-cleft. The stamens arise from the corolla. The ovary is generally 2-celled; there is one style. The fruit is a capsule, a drupe, or a berry. A few species of this order occur in Australia and in the temperate parts of North America; the rest are all tropical or subtropical. There are about 162 known species. No natural order of plants is more strongly characterized by poisonous properties. It includes the genus strychnos (q.v.), of which nux vomica (q.v.) is one of the products, and another is the woorali (q.v.) poison. *Strychnine* (q.v.) is a prevalent and peculiar characteristic principle of the loganiaceæ. Some of the order, however, are of use in medicine, as certain species of spigelia (q.v.).

LOGANSPORT, a city in Indiana, capital of Cass co.; at the junction of the Wabash and Eel rivers; pop. '70, 8,950; reached by the Detroit, Eel river, and Illinois; Logansport, Crawfordsville, and South-western; Pittsburgh, Cincinnati, and St. Louis; and Toledo, Wabash, and Western railroads. It is the center of a productive region, well wooded, and rich also in building-stone. There is a Universalist college and public-school buildings, 14 churches, banks, etc. The city is handsomely laid out and well paved, with fine residences and stores. It has important manufacturing industries, employing more than 1000 operatives.

LOGARITHMIC or LOGISTIC **CURVES** are curves whose abscissæ are proportional to the logarithms of the corresponding ordinates; consequently, if the abscissæ increase in arithmetical progression, the ordinates will increase in geometrical progression. The equation to these curves being $x = a \log. y$ (a being constant), $y\frac{dx}{dy} = a$, showing that

the subtangent has the same value for all points of the curve, and is the modulus (q.v.) of the system of logarithms represented by the particular curve. This curve has another remarkable property, viz., that the area contained between any two ordinates is equal to the difference of the ordinates multiplied by the constant subtangent.

LOGARITHMIC or LOGISTIC **SPIRAL** is a curve described by a point which moves uniformly along a uniformly revolving straight line. This curve has several remarkable properties, some of which are analogous to those possessed by the logarithmic curve. Its involute and evolute are the same with itself. Newton showed that if the force of gravity had varied inversely as the *cube* of the distance, the planets would have shot off from the sun in logarithmic spirals. The equation to the curve is $r = ca^x$.

LOGARITHMS, a series of numbers having a certain relation to the series of natural numbers, by means of which many arithmetical operations are made comparatively easy. The nature of the relation will be understood by considering two simple series such as the following, one proceeding from unity in geometrical progression, the other from 0 in arithmetical progression:

Geometrical series—1, 2, 4, 8, 16, 32, 64, 128, 256, 512, etc.
Arithmetical series—0, 1, 2, 3, 4, 5, 6, 7, 8, 9, etc.

Here the ratio of the geometrical series is 2, and any term in the arithmetical series expresses how often 2 has been multiplied into 1 to produce the corresponding term of the geometrical series; thus, in proceeding from 1 to 32, there have been 5 steps or multiplications by the ratio 2; in other words, the ratio of 32 to 1 is compounded five times of the ratio of 2 to 1. It was this conception of the relation that led to giving the name of *logarithms* to the arithmetical series, the word *logarithm* (Gr. *logon arithmos*) meaning "the number of the ratios." As to the use that may be made of such series, it will be observed that the sum of any two logarithms (as we shall now call the lower series) is the logarithm of their product; e.g., 9 (= 3 + 6) is the logarithm of 512 (= 8 × 64). Similarly, the difference of any two logarithms is the logarithm of the quotient of the numbers; a multiple of any logarithm is the logarithm of the corresponding number raised to the power of the multiple; e.g., 8 (= 4 × 2) is the logarithm of 256 (= 16^2); and a submultiple of a logarithm is the logarithm of the corresponding root of its number. In this way, with complete tables of numbers and their corresponding logarithms, addition is made to take the place of multiplication, subtraction of division, multiplication of involution, and division of evolution.

In order to make the series above given of practical use, it would be necessary to complete them by interpolating a set of means between the several terms, as will be explained below. We have chosen 2 as the fundamental ratio or base, as being most convenient for illustration; but any other number (integral or fractional) might be taken; and every different base, or *radix*, gives a different system of logarithms. The system now in use has 10 for its base; in other words, 10 is the number whose logarithm is 1.

The idea of making use of series in this way would seem to have been known to Archimedes and Euclid, without, however, resulting in any practical scheme; but by the end of the 16th c., trigonometrical operations had become so complicated that the wits of several mathematicians were at work to devise means of shortening them. The real invention of logarithms is now universally ascribed to John Napier (q.v.), baron of Merchistoun, who in 1614 printed his *Canon Mirabilis Logarithmorum*. His tables only give logarithms of sines, cosines, and the other functions of angles; they also labor under the three defects of being sometimes + and sometimes −, of decreasing as the corresponding natural numbers increase, and of having for their *radix* (the number of which the logarithm is 1) the number which is the sum of $1 + 1 + \frac{1}{1.2} + \frac{1}{1.2.3} +$, etc. These defects were, however, soon remedied: John Speidell, in 1619, amended the tables in such a manner that the logarithms became all positive, and increased along with their corresponding natural numbers. He also, in the sixth edition of his work (1624), constructed a table of Napier's logarithms for the integer numbers, 1, 2, 3, etc., up to 1000, with their differences and arithmetical complements, besides other improvements. Speidell's tables are now known as *hyperbolic logarithms*. But the greatest improvement was made in 1615 by prof. Henry Briggs (q.v.), of London, who substituted for Napier's inconvenient "radix" the number 10, and succeeded before his death in calculating the logarithms of 30,000 natural numbers to the new radix. Briggs's exertions were ably seconded; and before 1628 the logarithms of all the natural numbers up to 100,000 had been computed. Computers have since chiefly occupied themselves rather in repeatedly revising the tables already calculated than in extending them.

Construction of Tables.—The following is the simplest method of constructing a table of logarithms on Briggs's system. The log. of 10 = 1·; the log. of 100 (which is twice compounded of 10) = 2·; the log. of 1000 = 3·, etc.; and the logarithms of all powers of 10 can be found in the same manner. The intermediate logarithms are found by continually computing geometric means between two numbers, one greater and the other less than the number required. Thus, to find the log. of 5, take the geometric mean between 1 and 10, or 3·162..., the corresponding arithmetic mean (the log. of 1 being 0, and that of 10 being 1·) being ·5; the geometric mean between 3·162... and 10, or 5·623..., corresponds to the arithmetic mean between ·5 and 1·, or ·75; the geometric

mean between 3·162... and 5·623..., or 4·216..., has its logarithm $= \frac{1}{2}(\cdot 75 + 5)$, or ·625; this operation is continued till the result is obtained to the necessary degree of accuracy. In this example, the twenty-first result gives the geometric mean = 5·000,003, and the corresponding arithmetic mean = ·698,970, which is in ordinary calculations used as the logarithm of 5. Since division of numbers corresponds to subtraction of logarithms, and since $2 = \frac{10}{5}$, the log. of 2 = log. 10 − log. 5 = 1· − ·698970 = ·301030. The logarithms of all prime numbers are found in the same way as that of 5; those of composite numbers are obtained by the addition of the logarithms of their factors; thus, the log. of 6 = log. 2 + log. 3 = ·301030 + ·477121 = ·778151. This method, though simple in principle, involves an enormous amount of calculation; and the following method, which depends on the modern algebraic analysis, is much to be preferred. According to this method, logarithms are considered as indices or powers of the radix; thus, $10^0 = 1$, $10^{\cdot 301030} = 2$, $10^{\cdot 477121} = 3$, $10^2 = 100$, etc.; and the laws of logarithms then become the same as those of indices. Let r represent the radix, y the natural number, x its logarithm; then $y = r^x$, or, putting $1 + a$ for r, $y = (1 + a)^x$; and it is shown by the binomial and exponential theorems (see the ordinary works on algebra) that $y = 1 + Ax + \frac{A^2x^2}{1.2} + \frac{A^3x^3}{1.2.3} +$, etc., where $A = r - 1 - \frac{1}{2}(r-1)^2 + \frac{1}{3}(r-1)^3 -$, etc., the former equation expressing a number as the sum of different multiples of its logarithm and the radix. If $\frac{1}{A}$ be substituted for x, then $y = r^{\frac{1}{A}} = 1 + 1 + \frac{1}{1.2} + \frac{1}{1.2.3} +$, etc. = 2·71828182..., which, as before mentioned, is Napier's radix, and is generally called e; then $r^{\frac{1}{A}} = e$, or $r = e^A$, or A is the logarithm of r to the base or radix e. Then, referring to the above-mentioned value of A, we have log. $_e r$ (i.e., log. of r to the base e) $= r - 1 - \frac{1}{2}(r-1)^2 + \frac{1}{3}(r-1)^3 -$, etc., or, as before, putting $1 + a$ for r, log. $_e(1 + a) = a - \frac{a^2}{2} + \frac{a^3}{3} -$, etc.; a series from which log. $_e(1 + a)$ cannot be found, unless a be fractional. However, if we put $-a$ for a, log. $_e(1 - a) = -a - \frac{a^2}{2} - \frac{a^3}{3} -$, etc.; and subtracting this expression from the former, log. $_e(1 + a)$ − log. $_e(1 - a)$ or log. $_e\left(\frac{1+a}{1-a}\right) = 2(a + \frac{a^3}{3} + \frac{a^5}{5} +$, etc.), and, for the sake of convenience, putting $\frac{u+1}{u}$ for $\frac{1+a}{1-a}$, in which case $a = \frac{1}{2u+1}$, we finally obtain log. $\frac{u+1}{e^u} = 2\left\{\frac{1}{2u+1} + \frac{1}{3(2u+1)^3} + \frac{1}{5(2u+1)^5} +, \text{ etc.}\right\}$, or log. $_e(u+1) = \text{log. } _e u + 2\left\{\frac{1}{2u+1} + \frac{1}{3(2u+1)^3} + \frac{1}{5(2u+1)^5} +, \text{ etc.}\right\}$. If 1 be put for u in this formula, the Napierian logarithm of 2 is at once obtained to any degree of accuracy required; if 2 be put for u, the Napierian logarithm of 3 can be calculated, etc. Now, as logarithms of any system have always the same ratio to one another as the corresponding logarithms of any other system, no matter what its base, if a number can be found which, when multiplied into the logarithm of a certain number to one base, gives the logarithm of the same number to another base, this multiplier will, when multiplied into *any* logarithm to the first base, produce the corresponding logarithm to the other base. The multiplier is called the modulus (q.v.), and, for the conversion of Napierian into common or Briggs's logarithms, is equal to ·4342944...; so that *to find the common logarithm of any number, first find the Napierian logarithm, and multiply it by* ·4342944...

As in Briggs's system the logarithm of 10 is 1·, and that of 100 is 2·, it follows that all numbers between 10 and 100 have, for their logarithms, unity + a proper fraction; in other words, the integer portion of the logarithms of all numbers of two figures is unity; similarly, the integer portion of the logarithms of numbers between 100 and 1000 is 2, and, in general, the integer portion of the logarithm of any number expresses a number less by unity than the number of figures in that number. This integer is called the *characteristic*, the decimal portion being designated as the *mantissa*.

As the logarithm of 1 = 0, the logarithms of quantities less than unity would naturally be negative; thus, the logarithm of $\frac{1}{2}$ would be—·30103, but, for convenience in working, the mantissa is kept always positive, and the negative sign only affects the characteristic; the logarithm of $\frac{1}{2}$ or ·5 would thus be $\bar{1}$·69897, the characteristic in this and similar cases expressing, when the fraction is reduced to a decimal, the number of places the first figure is removed from the decimal point; thus, the logarithm of ·0005 is $\bar{4}$·69897

Directions for the use of logarithms in calculation will be found prefixed to any set of tables. The history of the discovery is given in the preface to Dr. Hutton's Tables.

The tables most distinguished for accuracy are those of Callet (who edited Gardener's edition of *Sherwin's Tables*, making several additions and improvements), to seven places of decimals (Paris, 1821); Lalande, to five places (Paris, 1831); Hutton, to

seven places (1849), issued in a more convenient form, with improvements, by Messrs. W. & R. Chambers; the most accurate of all, however, are supposed to be those which Mr. Babbage produced with the aid of his ingenious calculating-machine.

LOGGIA, an Italian word signifying an open arcade, inclosing a passage or open apartment. It is a favorite class of building in Italy and other warm countries. The Loggia de' Lanzi at Florence is one of the finest examples extant; and the loggie of the Vatican, which are arcaded passages round the interior of the cortile of the palace, ornamented with beautiful paintings and arabesques by Raphael and his pupils, are well-known specimens.

LOGIC. This name denotes the science connected with the forms and methods of reasoning, and the establishment of truth by evidence. The science has come down to us from the Greeks, obtaining in great part the shape that we find it in from Aristotle, although he did not apply to it the name "logic." This name, signifying originally both thought and the expression of thought, must have been applied soon after the time of Aristotle. The most ancient name was "dialectic," meaning literally "conversation," "colloquy," or "dispute." (Hamilton's *Logic*, lect. 1.) "But it appears that Aristotle possessed no single term by which to designate the general science of which he was the principal author and finisher. *Analytic*, and *apodeictic* with *topic* (equivalent to *dialectic*, and including *sophistic*), were so many special names by which he denoted the particular parts or particular applications of logic."

The definition of logic has never been, till lately, a matter of serious controversy. There was formerly a substantial unanimity, with some variations in the form of the phraseology employed. We find it called usually the art of reasoning, or the science of reasoning, or both the one and the other. And by reasoning has been always understood *formal* reasoning; that is, inferences stated in such general language that they apply to all kinds of matter alike, as when in arithmetic we say three times four is twelve, without considering what the numbers are numbers of. A modification of this view has been adopted by sir W. Hamilton; he calls logic the "science of the laws of thought as thought." The introduction of the larger word "thought" is considered requisite, because "reasoning" is somewhat too limited, there being processes included in logic, and necessary to the establishment of truth, which that word does not cover; such, for example, are conception—the forming of general notions—and judgment, the statement of propositions (see JUDGMENT). But the word "thought" having an acceptation co-extensive with all intelligence, including memory, imagination, etc., as well as the operations concerned about truth, must be held to its narrower meaning, by which it simply includes the three great operations, constituting the distinct stages or divisions of logic, conception, judgment, and reasoning.

Mr. John Stuart Mill has propounded a radical innovation in the definition and province of this subject. According to him, logic "is the science of the operations of the understanding which are subservient to the estimation of evidence; both the process itself of proceeding from known truths to unknown, and all other intellectual operations in so far as auxiliary to this. It includes, therefore, the operation of naming; for language is an instrument of thought, as well as a means of communicating our thoughts. It includes also, definition and classification."

This definition has the merit of setting distinctly forth the *end* of the science, which is the essential point in every *practical* science, as logic is. That end is the *estimation of evidence;* in other words, it is not the ascertainment of *all* truth, but of those portions of truth that are authenticated by means of other truths, or by *inference*. The proper conduct of the operation of inferring one thing from another is the final end of the whole science. And in laying down the true criteria of inference, a certain amount of study has to be bestowed upon some of the operations of the human understanding, not to the extent of converting logic into a system of mental philosophy, but simply so far as will conduce to the purpose in view. It is not, therefore, the "laws of thought as thought," but the laws of thought as bearing upon the arts of inference, that Mr. Mill would esteem the matter of the science.

But inference is admitted on all hands to be of two kinds—deductive or formal inference, and inductive or real inference. In the one, no more is inferred than is already contained in the premises; for example, "All men are mortal, therefore the present generation of Englishmen will die," is a formal inference; the conclusion is within, or less than, the premises. This is the kind of inference treated of in the deductive or syllogistic logic, which was till lately the whole of the science. In the other kind of inference, a conclusion is drawn wider than the premises, so that there is a real advance upon our knowledge: from certain things directly ascertained we infer other things that have not been ascertained by direct experiment, and which, but for such inference, we should have had to determine in that manner. Thus, "This, that, and the other piece of matter, in which actual observations have been made, gravitates," therefore, "all inert matter, existing everywhere, known and unknown, gravitates," is an inductive inference. Of this last class of inferences, all the inductive sciences, including physics, chemistry, physiology, mental philosophy, etc., are made up. Accordingly, Mr. Mill treats this as coming within the province of logic, no less than the deductive, formal,

syllogistic, or necessary inference, which previous logicians had confined themselves to exclusively.

Sir W. Hamilton, in his system, admits the consideration of induction under what he terms "modified logic," in contradistinction to "pure logic," or formal inference; and it has not been unusual for writers on the science to devote a chapter to induction, after expounding the laws of the syllogism. But Mr. Mill has given to the inductive part the predominance over the other, as being the more fundamental, as well as practically the more important of the two. Making logic co-extensive with proof, he endeavors to show that the establishment of the *premises*, from which the formal logician takes his start, is, after all, the main point, and that the other is subsidiary and subordinate, although still important to be attended to, and susceptible of being well or ill done. He further shows that there are rules, or methods of procedure, which may be set forth and followed in the inductive operation; that mankind often break those rules from ignorance or inadvertence (as well as from other causes); and that good may be done by explicitly calling attention to them, and making them a branch of education, as the old logic has for a long time been. See INDUCTION, SYLLOGISM.

LOGIC (*ante*). Regarding the science as concerned directly only with the form and not the substance of reasoning, logic finds its starting point in human intuitions and thoughts, which, by the processes of conceiving, judging, and reasoning, produce, respectively, concepts, judgments, and arguments. These products, in turn, are expressed in language by terms, propositions, and syllogisms. It is with the division, definition, classification, and contradistinction of these, and more especially with the truth or fallacy of all conceivable syllogisms, that logic principally deals. Thus, concepts may be congruous or incongruous, may or may not be true, or valid, or distinct; judgments may be as to quantity, universal (all M is P) or particular (some M is P); as to quality, they may be affirmative (all M is P) or negative (no M is P), they may be categorical or conditional, true or not, and so on. Each judgment contains two concepts, which stand in the relation of subject and predicate and are connected by some verb of being; and it may be noted that predicables, or terms affirmable of others, are grouped in five classes, as they denote genus, species, difference, property, and accident. Either of these concepts is said to be distributed when it is taken as a whole, and undistributed when but part is taken. From the various attributes and varieties of the judgments and their elementary concepts are evolved rules as to opposition and distribution, such as: "The truth of a universal implies the truth of a negative," and "All universals distribute the predicate."

As concepts compose the judgments, so judgments or propositions compose the syllogism. For example, in this simple but complete syllogism: "All M is P; all S is M; hence, all S is P," the first proposition is called the major premise, the second the minor premise, and the third the conclusion. Now, it has already been seen that every proposition may be affirmative or negative and either universal or particular. We thus have the four primary propositions: universal affirmative, all S is P (A); universal negative, no S is P (E); particular affirmative, some S is P (I); particular negative, some S is not P (O), which in all works of logic are designated by the capitals A E I O, as above indicated. Combined in all possible ways to form syllogisms (three in each), we obtain 64 conceivable forms, of which only 11 are found to be sound when tested by the laws of distribution, and others which apply. These are called moods. Again, by changing the position of the middle term, each mood may be made to take four forms, which are termed figures. But of the 44 resulting syllogisms, only 19 can be proven true under the usual tests. To designate these, there has long been in use a set of otherwise meaningless words, often arranged in mnemonic Latin verses, in which the vowels represent the propositions and their order. These are as follows:

Fig. I. BA*rb*A*r*A, c*El*A*r*E*nt*, d*A*r I I, f*E*r*IO*que*, *prioris:*
II. CE*s*A*r*E, c*Am*E*str*E*s*, f*Est*InO, b*A*r*O*k*O, *secundæ:*
III. *Tertia* d*A*r*A*pt*I*, d*Is*A*mIs*, d*At*IsI, f*El*Apt*On*, B*O*k*A*rd*O*, f*E*r*Is*On habet: quarta insuper addit,*
IV. B*r*A*m*A*nt*Ip, c*Am*E*ns*E*s*, d*Im*A*r*Is, f*EsApO, *fr*EsIs*On*.

Ferio, for instance, stands for the syllogism E I O, as: "No M is P; some S is M; hence, some S is not P." The syllogisms of the last three figures may all be reduced to the form of the first for convenience in applying tests. One of the most interesting discussions connected with the science of logic arose from the proposition of sir William Hamilton to substitute for these 19 universally accepted syllogisms, others arising from the fact that any affirmative proposition may or may not have its subject, and any negative proposition its predicate, distributed. This would give eight propositions instead of four, and entirely overthrow the old method. Most modern treatises expound Hamilton's theory and notation, but the system descended from Aristotle is more easily understood and applied.

Syllogisms may be hypothetical, disjunctive (as: S is either P or Q; but S is P; *ergo*, S is not Q), or dilemmatic, a combination of the two. Sometimes one proposition does not appear, forming the enthymeme; and again, several syllogisms may be linked together,

the whole being termed the chain or sorites. Still another form is the epichirema, where the reason for each premise is given with it.

Fallacies are errors resulting from the improper use of words or mental processes in argument. They are variously classified. Among the most important are: generalization, or the attributing to a class individual limitations, as "S is a clergyman and a hypocrite—*ergo*, all clergymen are hypocrites;" equivocation, where a word is used in two senses; the *non vera pro vera*, where a premise is false; accident, where an accidental property is made to appear as a substantial attribute. For others and a more complete treatment of the subject, see FALLACY. An ancient Greek fallacy, which appears perennially as a modern joke, is the case of a man who says, "I lie." Does he lie or not? If he lie, he tells the truth; if he speak truly, he lies.

The study of formal logic in the monastic schools and universities of the middle ages was carried to an extent more recondite than profitable, the result being a not unmerited contempt for the science as then limited by the scholastic method. A classification and discussion of syllogisms in which no attention is given to the origin of the concepts which form the premises or to the process of induction, resembles rather a series of mathematical permutations than fruitful intellectual investigation. In fact, in our day, prof. Jevons has constructed what he calls a logical machine, which will perform many of the operations of syllogistic reasoning. In modern times the study has been in a measure reinstated; but it has been through the enlargement of the ground allotted it and the installment of induction as a most important factor. Thus widened in its scope, there may be derived from it laws of reasoning of the greatest value as forming the basis of all investigation in physical, philosophical, and moral science.

Among numerous authors who may be consulted on this topic are, besides Hamilton and Mill, archbishop Whately, Wallace, Jeremy Bentham (essays), William Stanley Jevons; and of American writers, profs. Bowen of Harvard, Wilson of Cornell, and Schuyler of Baldwin.

LO'GOGRAM (Gr. *logos*, a word, and *gramma*, a letter) is simply a complicated or multiplied form of the anagram (q.v.), where the puzzle-monger, instead of contenting himself with the formation of a single new word or sentence out of the old, by the transposition of the letters, racks his brain to discover all the words that may be extracted from the whole or from any portion of the letters, and throws the whole into a series of verses in which synonymic expressions for these words must be used. The puzzle lies in ascertaining what the concealed words are, and, through them, what is the primary word out of which they have all been extracted. A specimen is given in Henry B. Wheatley's book on *Anagrams* (1862), in which, out of the word "curtains," no less than 93 smaller ones are framed.

LOGOGRAPHERS, the name by which the Greeks designated their historians previous to Herodotus. The logographers described in prose the mythological subjects and traditions which had been treated of by the epic poets, supplementing them by traditions derived from other quarters, so as to form, at least in appearance, a connected history; their works, however, seeming to be intended rather to amuse their readers than to impart accurate historical knowledge. The term was also applied to those orators who composed judicial speeches or pleadings, and sold them to those who required them.

LOGOMA'NIA, or DISEASE OF THE FACULTY OF LANGUAGE. It frequently happens that, while the idea is clear and distinct, all trace of its representative sound has disappeared; or another sign, or one conveying the converse of what is intended, is used. Such a condition is often associated with organic disease of the nervous structure, as in paralytics. In certain cases, there is an irresistible rapidity of utterance, or, apparently, an involuntary utterance of certain words or phrases foreign to the character of the individual. In another class of cases, memory appears to be chiefly at fault; there may be the oblivion or all words; the forgetfulness of certain classes of words, such as substantives, while others are recollected and correctly applied; the forgetfulness of particular words, as of the individual's own name; or of parts of words, as occurs in general paralysis, where the last or penultimate syllable escapes attention, and is generally omitted; or there may be confusion as to orthography, and this has been observed when limited to a single letter. Dr. Graves, Dublin, mentions a farmer who retained a knowledge of all parts of speech except nouns and proper names; but even of these he recollected the initial letter: he carried a pocket-dictionary, and when about to use such words as "Cow" or "Dublin," turned to the letters "C" and "D," and then recalled what he wished. Patients are found who impose upon themselves a mutism as to certain phrases, and limit their vocabulary to particular expressions. In others, there is invariably a transposition of words; such as when, in place of saying, "the rose is beautiful," a paralytic recasts the sentence, "beautiful rose is," and all other sentences in a similar fashion. Fever, in Mezzofanti, is said to have swept away in an hour, his vast acquisitions in 60 languages; in other cases, it has recalled dialects forgotten for half a century; and mere excitement seems capable of inventing or inspiring a vast number of sounds assuming the aspect, and even the relations of a language so closely as to suggest doubts as to whether they are creations such as those of Psalmanazar, which deceived the linguists of the royal society, or those ebullitions of devotional feeling designated

"unknown tongues." In other forms of disease, the cries of animals or natural signs are resorted to in place of words; or the ordinary language is sung or chanted, or used rhythmically; or a foreign language may be employed or imitated. The bearing of such alterations upon the philosophy of mind, and upon any theory as to the origin of language, must be obvious; but they possess a still more intimate connection with the amount of intelligence and responsibility predicable in every case of disease of the nervous system.—Calmiel, *De la Paralysie considerée chez les Aliénés; Phrenological Journal*, No. 47; Coleridge, *Biographia Literaria*, vol. i. p. 112.

LO'GOS (Gr. from *lego*, "I speak") denotes the act of speaking; that which is spoken; the natural process gone through for the purpose of the formation of speech; the reasoning powers themselves—all the attributes and operations of the soul, in fact, as manifested by the spoken word. It thus occurs in the classical writers under the manifold significations of word or words, conversation, oration, exposition, command, history, prose, eloquence, philsophical proposition, system, reason, thought, wisdom, and the like. Theologically, the word logos, as occurring at the beginning of the gospel of St. John, was early taken to refer to the "second person of the Trinity, i.e., Christ." Yet what was the precise meaning of the apostle, who alone makes use of the term in a manner which allows of a like interpretation, and only in the introductory part of his gospel; whether he adopted the symbolizing usage in which it was employed by the various schools of his day; which of their widely differing significations he had in view, or whether he intended to convey a meaning quite peculiar to himself:—these are some of the innumerable questions to which the word has given rise in divinity, and which, though most fiercely discussed ever since the first days of Christianity, are far from having found a satisfactory solution up to this moment. The fact, however, is, that the notion of a certain manifestation or revelation out of the center of the Godhead, as it were—which manifestation, as a more or less personified part of the deity, stands between the realms of the infinite and the finite, of spirit and matter—has from times immemorial been the common property of the whole east, and is found expressed in the religions of the primitive Egyptians, as well as in those of the Hindus and Parsees. This notion of an embodiment of divinity, as "*word*" or "*wisdom*," found its way, chiefly from the time of the Babylonian exile, into the heart of Judaism, which in vain endeavored to reconcile it with the fundamental idea of the divine unity. The apocryphal writers chiefly pointed to the "wisdom"—of which Solomon (Prov. viii. 22) says that it had dwelt with God from the beginning, and Job (xxviii. 20), that it had assisted in the creation—as *the* emanation of God, which emanation was supposed to be bodily to a certain, however minute, degree. Thus, Sirach (xxiv. 1, 23) understands the "spirit of God" (Gen. i. 2) to be a kind of veil or mist, and speaks (i. 1, 9) of the "wisdom that is of the Lord and is with the Lord, everlasting," and that "it was *created* before all things, and known unto him" (ib.).

This *wisdom*, or *word* of creation, which, according to Sirach's view, formed and developed the chaos, further manifested itself—visibly—by a direct and immediate influence upon one select people, Israel, through which it wished further to influence all mankind. A nearer acquaintance with this doctrine in all its bearings at once solves the old riddle of certain Targumic interpretations, which have puzzled a host of investigators. Thus, versions like that of Targum Jerushalmi to Gen. i. 1, "with *wisdom*, God created heaven and earth," and the constant use of the term *Memra* (word) instead of *God* or *Jehovah*, become clear at once (see TARGUM, VERSIONS). No less must many passages in the Talmud and Midrash assume an entirely different aspect, if that prevalent mode of thought and speech is taken into consideration.

In the earlier Platonic schools, again, Logos, scil., of God, was the common term for "plan of the cosmos" or "divine reason," inherent in the deity. The later schools, however, more prone to symbol and allegory in philosophical matters, called Logos a "hypostasis of divinity," a substance, a divine corporeal essence, as it were, which became outwardly visible—a separate being, in fact, which, created out of the Creator, became "the Son of the Creator."

But above all, we have, for the proper consideration of the usage in the days of the apostles, to examine the Judæo-Alexandrian views on this point. Philo, who is their best representative, makes the Logos the all-comprising essence of spiritual powers (daimons, angels), which alone acts upon the universe. In this sense, the Logos stands as the *divine reason*, the *power of all powers*, the *spirit of God*, and his *representative*, between him and all else. Nay, he goes so far as to call it the *archangel*, who executes the behests of God to man; the *high-priest*, who prays for man, and interferes on his behalf, before the throne of the Almighty; and he finally speaks of Logos as "the second God" (*De Somn.* i. 655), and the "providence" (fate, fortune) which watches over the destinies of mankind and separate nations (*Quod Deus*, i. 298). These conceptions, which, he says, came to him in a trance, he does not allow, however, to be in the least derogatory to the strictest belief in the oneness, invisibility, and pure spiritualness of God, such as it is taught in the Jewish creed.—This characterizes sufficiently the general vagueness and haziness of philosophical and theological parlance and speculation in the Alexandrine schools, which, obviously unconscious of the palpable con-

traditions uttered in one breath, mixed up pure thought and visions, Scripture with eastern and western philosophy and theosophy, monotheism and polytheism, heaping systems upon systems, and dreams upon dreams.

If the apostle did not himself, to a certain degree, stand under the influence of some of the popular ideas connected with the term under consideration, it would, at any rate, seem most natural that he made use of it, as of one conveying a certain vague, yet commonly recognized transcendental notion of a divine emanation to the minds of his contemporaries. This opinion, however, is far from being unanimously adopted. Thus, some investigators hold that John, irrespective of the parlance of his day, used the word logos for *Legomenos*, i.e., he of whom it has been spoken, the promised one; others identify it with "doctrine;" while a third notion (held among others by Calvin and Luther) would make it equal to monologue, conversation.

For the person of the Logos as the mediator (Æon, Demiurgos, etc.), and the respective relation between him and the other persons of the divine trias, we must refer to the articles CHRIST, GNOSTICS, TRINITY.

LOGRO'ÑO, one of the six modern provinces which form the ancient province of Castilla la Vieja in Spain; 1945 sq.m.; pop. 182,941. It extends along the right bank of the Ebro, and includes portions of territory which formerly belonged to the provinces of Burgos and Soria. It is a productive region, rich in wine and corn, fruits and vegetables. Minerals also abound, and there are valuable mineral springs. Near the city of Logroño, a few miles s. of the Ebro, was fought, April 3, 1367, a desperate battle between Henry, count of Trastamara, elevated to the throne of Castile by the people of that country, and Edward the black prince, who had formed an alliance with the detestable Charles II., king of Navarre, surnamed "the wicked," to replace Pedro the cruel on the throne of Castile, from which he had been driven on account of his many enormities. This battle was decisive, and resulted in returning to Pedro his throne.

LOGRO'NO (Lat. *Julia Briga*), a t. of Spain, capital of the province of Logroño, is situated on the Ebro, 60 m. e. of Burgos. It is surrounded by walls, has several churches, convents, a theater, college, some manufactures, and a good trade in rural produce. Pop. 11,257.

LOGWOOD, the dark red solid heart-wood of *hæmatoxylon campechianum*, a tree of the natural order *leguminosæ*, sub-order *cæsalpineæ*. This tree grows in Mexico and Central America, and is perhaps a native of some of the West India islands; but is said to have been introduced into Jamaica in the beginning of the 18th c., although it is now naturalized there. It is the only known species of its genus. It grows to a height of 20 to 50 ft.; the leaves are pari-pinnate; the racemes many-flowered, and longer than the leaves. The sapwood is yellowish, and being worthless, is hewed off with the bark. The heart-wood is heavier than water, close-grained, but rather coarse. It has a slight smell resembling that of violets, a sweetish taste, is astringent, and contains a distinguishing crystalline principle, called *hæmatoxyline* (q.v.).

No dye-wood is imported in such large quantities as logwood; nearly 50,000 tons are annually sent to Great Britain. It was first introduced in the reign of queen Elizabeth, but the color was found to wash out, and the dyers not knowing how to fix it, much dissatisfaction was occasioned by the sale of cloths dyed with it, and an act of parliament was passed prohibiting its use. This act was repealed in 1661, since which time it has been constantly in use, science having shown means for fixing. Logwood is imported in large billets or logs, usually about 4 ft. in length, 18 in. in diameter, and of very irregular shape; the larger they are the greater their value; the color is a dark blood-red, becoming almost black after long exposure. The infusion of the wood is also blood-red, which color it yields readily to boiling water; it is changed to light red by acids, and to dark purple by alkalies. In dyeing with logwood, an alum mordant gives various shades of purple and violet—with the solution of tin, it gives violet, red, and lilac; with the sulphate or acetate of iron, it gives a black; but this is greatly improved in depth and softness, if gall-nuts are also used, which is generally the case. It is also one of the ingredients in both black and red ink; but Brazil-wood is usually preferred for the latter.

LÖHER, FRANZ VON; b. Paderborn, Germany, 1818; after studying at several German universities, traveled in Europe and visited Canada and the United States in 1846–47, and in 1849 established the *Westfälische Zeitung* at Paderborn. For political agitation he was imprisoned by the Prussian government, but was acquitted by the court. In 1853 he was professor at the university of Göttingen, and in 1855 in the university of Munich, and secretary of the academy. His works are *Des Deutschen Volkes Bedeutung in der Weltgeschichte; Geschichte und Zustände der Deutschen in Amerika;* the epic poem *General Spork; Land und Leute der alten und neuen Welt; Jacobäa von Bayern; Aus Natur und Geschichte vom Elsass-Lothringen.*

LOIGNY, BATTLE OF, Dec. 2, 1870, the Germans, under the grand-duke of Mecklenburg, winning a signal victory over the French, led by gen. Chanzy. The Germans lost in killed and wounded 3,000 men, the French nearly twice this number, besides 3,000

prisoners and 7 guns. Loigny, the site of the battle, is a hamlet of France, in Eure-et-Loir, 30 m. s.s.e. of Chartres.

LOIR, a small river of France, having its source s.w. of Paris, and running thence in a generally s.w. course to its junction with the Sarthe, a tributary of the Loire. Length about 200 miles. Navigable by means of 39 locks a distance of about 70 miles.

LOIRE (ancient *Liger*), the longest river in France, has its source in the Cevennes mountains, near Gerbier-des-Joncs, in the department of Ardèche, at an elevation of 4,550 ft., flows in a n.n.w. direction through the center of France as far as Orleans, where it bends round to the s.w. as far as Tours, and thence follows, in general, a western course to its embouchure in the bay of Biscay. Entire length, 612 miles. It becomes navigable a little above Roanne, at a distance from the sea of 450 miles. At one time, the depth of the water at its mouth was 18 ft. at ebb-tide; now it is only from 6 to 9 feet. The lower course of the Loire is adorned by wooded islets. In the lower part of its course, large dikes or *levées* have been built, to protect the surrounding country from inundations, from which, however, they sometimes suffer terribly. It receives about 40 affluents, of which the principal are the Loir, on the right; and the Allier, the Cher, the Indre, and the Vienne, on the left.

LOIRE, a department in the s.e. of France, formerly part of the province of Lyonnais, comprises the arrondissements of Montbrison, Roanne, and St. Etienne. Area, 1,178,234 English acres; pop. '76, 590,613. The basin of the Loire, which flows through this department, is a rather unfruitful valley, but the mountains are rich in iron and lead, and the coal-fields of the departmeut are the richest in France. Loire is also noted for the rearing of silk-worms, and for the excellence of its silk manufactures. The weaving of hemp and linen is also largely carried on. Its mineral springs are in great repute, especially those of St. Alban, Sail-sous-Couzan, and St. Galmier. The chief towns are St. Etienne, Roanne, Rive-de-Gier, and Montbrison.

LOIRE, HAUTE, a central department of France, bounded on the s. by the departments of Lozere and Ardèche. Area, 1,212,160 sq. acres; pop. '76, 313,721. The surface is mountainous; covered by the Cevennes, the Cantal mountains, and the Margaride chain, whose slopes are clothed with forests, and whose peaks are during about half the year covered with snow. Chief rivers, the Loire and the Allier. The soil of the plains is fertile, and the agricultural produce of the soil consisting of the usual crops with fruits is abundant. The climate is very various, owing to the irregularity of the surface. The arrondissements are Le-Puy, Yssengeaux, and Brioude; the capital, Le-Puy.

LOIRE-INFÉRIEURE, a maritime department in the w. of France, formed out of the southern portion of the old province of Brittany, and comprising the arrondissements of Nantes, Ancenis, Paimbœuf, Châteaubriant, and Savenay, lies on both sides of the river Loire. Area, 1,697,979 English acres; pop. '76, 612,972. In the s. of the department lies Grand-Lieu, the largest lake in France. The interior is, on the whole, flat, but the n.e. and s.e. are slightly hilly. The soil is fertile, producing wheat, rye, and barley, and forming in some parts rich pasturage. There are also some fine forests. Salt marshes are numerous in the west. The vineyards yield annually about 32,000,000 gallons of wine. Ship-building is carried on extensively at Nantes. The coast-fisheries and general export trade of the department are extensive. Capital, Nantes; none of the other towns are large.

LOIRET, a central department of France, formed out of the eastern portion of the old province of Orleannois, and comprising the arrondissements of Orleans, Montargis, Gien, and Pithiviers, lies on both sides of the river Loire. Area, 1,670,984 English acres; pop. '76, 360,903. The country is, for the most part, an elevated and fruitful plain, abounding in corn and wine—known as the plateau of Orleans; but the district along both banks of the Loire, called the *Sologne*, is a barren, sandy tract. Loiret contains several large forests. Cattle, sheep, and bees are extensively reared, and mineral springs are numerous.

LOIR-ET-CHER, a department of France, lying on both sides of the river Loire, and formed of part of the old province of Orleannois, comprises the arrondissements of Blois, Vendôme, and Romorantin. Area, 1,568,677 sq. acres; pop. '76, 272,634. The department is almost a uniform plain, broken only by vine-hills of trifling elevation. The northern part is more fertile than the south, three-fourths of which is occupied by marshes, heaths, and forests—the last of which, indeed, cover one-sixth of the entire surface. The chief products are corn, fruits, hemp, wine, and vegetables of all sorts. The rearing of sheep, poultry, and bees is carefully attended to, and there are also manufactures of woolens, cottons, leather, glass, etc. Principal towns, Blois, Romorantin, and Vendôme.

LO'JA, a t. of Spain, in the province of Granada, is situated on the slope of a hill near the left bank of the Xenil, 31 m. w. of Granada, and 41 n.n.e. of Malaga. Pop. 15,500. Loja is a thriving place, with 21 woolen factories, 3 paper-mills, and two hospitals, and was once of great military importance, being the key to Granada. The

summit of the slope on which the town is built is crowned with the ruins of a Moorish castle.

LOJA, a city of Ecuador in South America near the Andes, lat. 4° s.; pop. 12,000. It is the center of a great commerce in quinine. The surrounding country is elevated so far above the sea that grains of the temperate zone are produced as well as the fruits of the tropics. Manufactures of wool, cotton, and carpets are among the chief industries of the city.

LO'KEREN, a t. of Belgium, province of East Flanders, on the Durme, 12 m. e.n.e. of Ghent. It is a station on the Ghent and Antwerp railway. Pop. in '76, 17,400. Lokeren is a well-built town, with numerous schools, benevolent institutions, important manufactures of linen, cotton, and woolen goods, and large bleach-fields.

LOKI, a demi-god in the Scandinavian mythology. He did not belong to the race of the Aesir (see ASES), but to an older dynasty. Still, we find him from the very first on terms of intimacy with Odin, and received among the Aesir. His appearance is beautiful, and he is possessed of great knowledge and cunning. He often brings the new gods into difficulties, from which, however, he again extricates them. Hence he is to be regarded as the principle of strife and disturbance in the Scandinavian mythology; the "spirit of evil," as it were, mingling freely with, yet essentially opposed to, the other inhabitants of the Norse heaven, very much like the Satan of the book of Job. By his artful malice, he caused the death of Balder (q.v.), and was in consequence visited by the Aesir with most terrible punishments. He is sometimes called Asa-Loki, to distinguish him from *Utgarda-Loki*, a king of the giants, whose kingdom lies on the uttermost bounds of the earth; but these two are occasionally confounded. It is quite natural, considering the character of Loki, that at a later period he should have become identified with the devil of Christianity, who is called in Norway to the present day, *Laake*.

LOKMÂN (ABU AMAN?), a fabulous personage; the supposed author of a certain number of Arabic fables. He is by some Arabic writers called a nephew of Job or Abraham; by others a councilor of David or Solomon; others again identify him with Balaam, whose name signifies, like that of Lokmân, the *Devourer*. Equal uncertainty reigns respecting his native place and occupation. Thus, he is variously held to have been an Ethiopian slave, conspicuous for his ugliness, a king of Yemen, an Arabic tailor, a carpenter, a shepherd, and the like. Most probably, the circumstances and sayings of several men living at different periods have been fathered upon Lokmân, of whom Mohammed (Surah 31) says that to him "has been given *the wisdom*." There is also a great likeness to be recognized between himself and his fables and Æsop and those current under the latter's name. According to the Arabic writers, to Lokmân, as the ideal of wisdom, the kingdom of the world was offered, but was by him declined—provided this was no offense against piety—because he felt much happier as he was; and that when asked what was the secret of the goodness and wisdom of all his deeds, he replied: "It is this: I always adhere to the truth; I always keep my word; and I never mix myself up with other people's affairs."

The fables that go by Lokmân's name are for the most part Indian apologues, which were first rendered into Greek, thence into Syriac, and finally into Arabic. They are, in this last form, of a comparatively recent date, and thus unknown to all the classical writers. The language is very corrupt, and it is highly to be regretted that the book, for want of anything better, still holds its rank as an elementary book for Arabic students. Its first redaction is, according to a note to a manuscript in the imperial library in Paris (Suppl. No. 58), due to an Egyptian Christian, Barsuma, who probably lived towards the end of the 13th century. The first edition, with a Latin translation by Erpemius, appeared at Leyden (1615). The book has been frequently translated into European languages—into French, by Tanneguy, Schier, etc.; into Spanish, by Miguel Garcia Ascensio, etc.; into Danish, by Rask; into German, by Olearius, Schaller, etc. Recent editions are by Bernstein (Gött. 1817), Caussin de Perceval (Paris, 1818), Freytag (Bonn, 1823), Rödiger (Leip. 1830, etc.), Schier (Dres. 1831), Rasch (Copenh. 1832), Derenburg (Berl. 1850), etc.

A book, *Amthâl* (Parables), ascribed to Lokmân, and supposed to contain more than a thousand apologues, maxims, parables, sentences, etc., has never been discovered. Lokmân's supposed grave is shown at Ramlah, near Jerusalem.

LOLA MONTEZ (MARIA DOLORES PORRIS), Countess of Landsfelt, 1824–61; alleged by Mirecourt, author of *Les Contemporaines*, to have been born in Montrose, Scotland, though she claimed Seville, Spain, as her birthplace. When quite young she married capt. James of the East India service against the wish of her mother, and traveled with him in India. She also accompanied him during an expedition against the Afghans. About 1838 she obtained a separation from her husband, and traveled in Europe, leading an erratic life in the different capitals, at one time singing barcaroles in the streets of Warsaw, and again appearing as a danseuse in the theater of that city. She now adopted the stage as a profession, appearing usually as a dancer, and, though possessing little skill in that direction, achieved a certain degree of popularity by her graceful person and charming vivacity of manner. In 1847 she visited Munich, and there attracted the atten-

tion of king Louis of Bavaria. She was at this time very attractive, handsome, and with a remarkable talent for political intrigue. The king gave her a residence in Munich and an income estimated at $25,000 per annum, and made her the confidant of his political schemes. She soon exercised a powerful influence, and, as is believed, for the interest of Bavaria. But she made many enemies, the Jesuits, as she averred, being active against her. A difficulty with the students of the university of Munich at length precipitated her downfall, and the king was forced by his counselors to consent to her arrest and deportation from the country. This act was followed by the abdication of the king himself, who afterwards vainly sought to renew his association with Lola Montez, who absolutely rejected his advances. During her stay in Munich, she was named by the king countess of Landsfelt, with the consent of the crown prince. Lola now visited England, and in 1849 was married to George Stafford Heald, esq., of the 2d life-guards, a gentleman of family and position, with an income of £6,000 per annum. His family opposed the match, and on Aug. 6, 1849, through their instigation, she was brought before a London police court on a charge of bigamy; her former husband, capt. James, being still living in India. Her defense (of a divorce) was not accepted, the law prohibiting either party from marrying again during the life-time of the other; Heald accordingly obtained a divorce, and Lola continued to lead her former wandering life. She sailed for New York in the autumn of 1851, on board the same steamer with Louis Kossuth, arriving on Dec. 5. She appeared at the Broadway theater in a piece called *Lola Montez in Bavaria*, and as a danseuse in most of the large cities. In 1855 she took a company of players to Australia, and gave some of her characteristic performances in the principal towns. In 1858 she delivered a lecture on *Beautiful Women* in New York. The last few years of her life were passed in retirement.

LOLIGO, or SQUID. See CALAMARY, *ante*.

LOLIUM. See DARNEL and RYE-GRASS.

LOL'LARDS, or LOLL'HARDS, a semi-monastic society, the members of which devoted themselves to the care of the sick and of the dead. It was first formed about the year 1300 in Antwerp, where some pious persons associated themselves for the burial of the dead. They were called from their frugal life, and the poverty of their appearance, *Matemans;* also, from their patron saint, *brethren of St. Alexius;* and, on account of their dwelling in cells, *Fratres Cellitæ;* whilst they acquired the name Lollards from their practice of singing dirges at funerals—the Low-German *lollen*, or *lullen*, signifying to sing softly or slowly. They soon spread through the Netherlands and Germany, and in the frequent pestilences of that period were useful and everywhere welcome. The clergy and the begging-friars, however, disliked and persecuted them, classing them with the heretical *Beghards* (see BEGUINES), till Gregory XI. took them under his protection in 1374. Female Lollard societies were formed in some places. The Lollards having been reproached with heresy, their name was afterwards very commonly given to different classes of religionists, sometimes to the truly pious, sometimes to the worst pretenders; and in England it became a designation of the followers of Wycliffe (q.v.), and thus extended into Scotland, where the *Lollards of Kyle* (in Ayrshire) attracted attention, and became the objects of persecution in the end of the 15th century.

LOLLARDS (*ante*), a name at first, about the beginning of the 14th c., applied to the Cellites, who, at Antwerp, devoted themselves to the care of persons ill with pestilential diseases; and afterwards, during the close of that century and through the next, given to the followers of Wycliffe. Various explanations of the name have been suggested, one of which, favored by many, is that derived from the Low-German word *lullen*, or *lollen*, which means to sing low or softly; it was applied to the Cellites because they sang low and plaintively at funerals. A later and more probable theory derives it from *lollardus*, the Latin form of the old English "loller," one who lolls or lounges about, a vagabond. It was applied at first both to the begging-friars and to the Wycliffites; but afterwards being restricted to the latter, it occasioned, by its resemblance to the Latin "lolia," the punning accusation that they were tares among the wheat. Many of them, sent forth by Wycliffe to carry the gospel into the remote villages, were called "poor priests" by the people, to large numbers of whom they preached in the fields, churchyards, and market-places.

After Wycliffe had taken the degree of D.D. at the university of Oxford, and had commenced there his earnest appeals against papal errors, he aroused the hatred of the bishops, and became prominent as an advocate and leader of reform. When he retired from the university to the little parish of Lutterworth, the work went on with unabated power. Those who had been instructed by either his preaching or writings were active in diffusing his doctrines abroad. His followers were found among all classes of people; some of the more distinguished being influenced somewhat perhaps by political motives, but the greater part chiefly by the power of religious truth. The judicial examinations of those who, in the next age, were arrested for heresy show that they all cherished, substantially, the doctrinal views which Wycliffe had taught. The principal of these views were: the supreme authority of the Scriptures as the rule of faith; the finished work of Christ as the only Savior; and the denial of transubstantiation, auricular confession, image worship, the papal hierarchy, and the priestly offices in the mass. At the time

of Wycliffe's death the number of his followers was increasing rapidly, as was indicated by the somewhat extravagant affirmation of Knighton that nearly every second man in England was a Lollard. In 1382 a council, convened by archbishop Courtney, condemned 10 of Wycliffe's articles as heretical and 24 as erroneous. The archbishop published an order forbidding any man, of any estate or condition whatsoever, to hold, teach, preach, or defend the aforesaid heresies and errors, or any of them, or even allow them to be preached or favored either publicly or privately. Bishops and priests were exhorted to become inquisitors of heretical pravity, and were threatened with excommunication if they neglected their duty in this respect. The chancellor of the university, charged with "being somewhat inclined to the errors aforesaid," was enjoined to allow no one under his jurisdiction to teach or defend them. At length, violent persecution was commenced. Some of the accused recanted, and became bitter persecutors of their former friends. Others fled out of the country. In other parts, also, of the kingdom the Lollards were actively teaching their doctrines. In Leicester and the vicinity they made great progress; and as the people hid their teachers, the whole city and all its churches were placed under interdict until all the Lollards of the town should forsake their heresy and obtain absolution. To arrest their advance and break up their meetings, parliament resolved that if any persons, on conviction, refused to abjure their errors, they should be delivered over to the secular arm to be burned. William Sautre, "a good man and faithful priest, inflamed with zeal for true religion," was condemned and committed to the flames in an open part of London. The "cruel constitution" of archbishop Arundel forbade any one to preach in English, either within the church or without, except by permission of the bishop. Schoolmasters and teachers were forbidden to teach anything contrary to what the church had declared. No book or treatise of Wycliffe was to be read anywhere. No person was allowed to write or print a translation of any text of Scripture into English or any other language. No one was to dispute upon articles determined by the church. No scholar or inhabitant of Oxford university was to propose or defend anything contrary to the determinations of the church.

But all these measures proving insufficient to suppress the hated opinions, the active persecution also went on, and many persons were burned. The accession of Henry V. was signalized by his surrendering to the persecutors his friend sir John Oldcastle, who was arrested, condemned, and excommunicated. At first he contrived to escape from prison, but was rearrested, and in 1417 was burned at the stake. The parliament further enacted "that whatsoever they were who should read the Scriptures in the mother tongue, they should forfeit land, cattle, body, life, and goods from their heirs forever; and so be condemned for heretics to God, enemies to the crown, and most arrant traitors to the land." In case of relapse after pardon, they were to be hanged as traitors against the king, and then burned as heretics against God. The last executions took place in 1431.

In Scotland, also, especially in the western districts, the Lollards were numerous, and suffered persecutions during different parts of the 15th century. Near the close of it 30 persons were summoned before king James IV. and the great council. Happily for them the king refused to sanction their condemnation, and they were released. After the opening of the 16th c. the Lollards gradually became incorporated with the reformed churches.

LOLL BAZAAR, an inconsiderable t. of northern India, in the district of Cush Behar, between the rivers Durlah and Tista, in n. lat. 26° 4′, and e. long. 89° 18′. It partly occupies the site of the ruined city of Komotapur, a "most stupendous monument of rude labor," the walls of which were 19 m. in circumference in the inside of the inner ditch. Massive ruins are still to be seen.

LOMBARD, PETER (rather, Peter the Lombard), one of the most famous of the schoolmen, was b. at a village near Novara, in Lombardy. He was a pupil of Abelard, afterwards became a teacher of theology in Paris, and in 1159 was appointed bishop of Paris. Bayle says that he was the first who obtained the title of doctor of theology in the university of Paris. He died at Paris in 1164. He was very generally styled *magister sententiarum*, or the *master of sentences*, from his work *Sententiarum Libri IV.*, an arranged collection of sentences from Augustine and other fathers, on points of Christian doctrine, with objections and replies, also collected from authors of repute. It was intended as a manual for the scholastic disputants of his age, and as may be inferred from what has just been said, is a compilation rather than an original work. It was the subject of many commentaries down to the time of the reformation. The works of Peter Lombard were edited by Aleaume (Louvain, 1546).

LOMBARD ARCHITECTURE is the style which was invented and used by the Gothic invaders and colonists of the n. of Italy, from about the age of Charlemagne till it was superseded by the importation of the pointed style from France in the beginning of the 13th century. The architecture of the Lombards was derived from the Romanesque (q.v.), or debased Roman style which they found in the country—the general plan of the churches, and the general form of the pillars, arches, etc., being almost identical with that of the Roman basilicas (q.v.). But in detail there is no such resemblance; the

Roman traditions are entirely abandoned, and instead of the debased acanthus leaves and fragments of entablatures, so characteristic of the Romanesque style, the Lombards adopted a freer imitation of natural forms in their foliage, and covered their buildings with representations of the fights and hunting-expeditions in which they delighted. On their first arrival in Italy they used Italian workmen; but when their own people became more numerous they also laid aside the sword for the trowel. Accordingly, wherever in n. Italy the Lombards were numerous, their style prevailed; and where the Romans predominated, the Romanesque prevailed. The n. of Italy belonged naturally, at the time of Charlemagne, to the great German empire, and thus we find nearly the same style of architecture in Lombardy and in Germany as far n. as the Baltic. See RHENISH ARCHITECTURE. Few early examples of Lombard architecture exist. In the unruly times when the style originated, the buildings were no doubt frequently destroyed by fire; this seems to have led to the desire to erect fireproof structures, and thus the earlier as well as almost all the later examples are vaulted with stone, whereas the Romanesque basilicas are generally roofed with wood. This stone roof seems to have been the great desideratum in the new style. The earliest example is a small chapel at Friuli, built probably during the 8th c., and it is covered with an intersecting vault. Examples of this date are rare in Italy; but in Switzerland, where the style is almost identical, several interesting specimens of early architecture remain, such as the churches of Romain-Motier, Granson, Payerne, etc., in which the transition from the Romanesque to the round-arched Gothic is very clearly traceable. We there find the peculiar arch-ornament so characteristic of Lombardy and the Rhine, and we can trace the timid steps by which the Goths advanced in the art of vaulting.

The vaulting is the leading feature of Lombard architecture, and from it spring the other distinguishing forms of the style. Thus, the plain, round pillars, with a simple base and capital, which served to support the side-walls and roof of a basilica, are changed for a compound pier, made up of several shafts, each resting on its own base, and each provided with a capital to carry the particular part of the vaulting assigned to it. This change is deserving of particular notice as the first germ of that principle which was afterwards developed into the Gothic style (q.v.). Buttresses are also introduced for the first time, although with small projection.

The *cathedral* of Novara is one of the most striking examples of Lombard architecture. It belongs to the 11th century. It is derived from the old basilican type, having at the w. end an open atrium, with arcade around, from which the church is entered by a central door. The interior is divided into central and side aisles, with vaulted roof, and terminated with an apsidal choir. At the end of the atrium opposite the church, is situated the baptistery. At Asti there is an interesting example of the early Lombard baptistery. The same general arrangement of plan afterwards became common in the German churches, the atrium being roofed over and included in the nave, and the baptistery forming the western apse of the double-apsed churches. The elevation of Novara is ornamented with those arcades and arched string-courses so common in Lombard and Rhenish architecture.

San Michele at Pavia and San Ambrogio at Milan are also good early examples of this style. In both, the grouping of the piers into vaulting shafts, wall-arch shafts, etc., is complete, and that beautiful feature of the style, the arcade round the apse, is fully developed. The atrium and w. front of San Ambrogio form one of the finest groups of Lombard architecture.

Lombard architecture is important as forming a link between the Romanesque of Italy and the Gothic of the Cisalpine countries. On the one hand, its origin can be traced back to the Roman basilicas; while on the other it embodied those principles from the development of which sprang the great Gothic style of the middle ages.

LOMBARDS, a German people of the Suevic family, not very numerous, but of distinguished valor, who played an important part in the early history of Europe. The name is derived from *Longobardi*, or *Langobardi*, a Latinized form in use since the 12th c., and was formerly supposed to have been given with reference to the long beards of this people; but it is now derived rather from a word *parta*, or *barte*, which signifies a battle-axe. About the 4th c. they seem to have begun to leave their original seats (on the lower Elbe, where the Romans seem to have come first in contact with them about the beginning of the Christian era), and to have fought their way southward and eastward till they came into close contact with the eastern Roman empire on the Danube, adopted an Arian form of Christianity, and after having been for some time tributary to the Heruli, raised themselves upon the ruins of their power, and of that of the Gepidæ, shortly after the middle of the 6th c., to the position of masters of Pannonia, and became one of the most wealthy and powerful nations in that part of the world. Under their king Alboin (q.v.), they invaded and conquered the n. and center of Italy (568–69). The more complete triumph of the Lombards was promoted by the accession of strength which they received from other tribes following them over the Alps—Bulgarians, Sarmatians, Pannonians, Norici, Alemanni, Suevi, Gepidæ, and Saxons—for the numbers of the Lombards themselves were never very great.

The Lombards, after the example of the Romans themselves in the conquests of

former times, were for the most part contented with a third of the land or of its fruits. One of their kings, Authari (584–90), assumed the title of Flavius, which had been borne by some of the later Roman emperors, and asserted the usual claims of a Roman ruler; while the administration of the Lombard kingdom was soon so superior to that which then prevailed in other parts of Italy that to many the change of masters was a positive relief from unjust and severe exactions. While the higher nobility, however, in general retained some portion of their former wealth and greatness, the possessors of small properties became fewer in number, and sunk into the class of mere cultivators, to whom it was comparatively indifferent whether they acknowledged a Roman or a Lombard superior. The rights of the municipal corporations also, although acknowledged, were gradually abridged, partly through the encroachments of the Lombard dukes, and partly through those of the higher clergy, till few relics of their ancient self-government remained. These few, however, were the germs from which, at a subsequent period, the liberties of the independent Italian cities were developed.

The conversion of the Arian Lombards to the orthodox faith was brought about by the policy of Gregory the great and the zeal of Theodolinda, wife of Authari, and subsequently of his successor, Agilulf (590–615).

Theodolinda persuaded Agilulf to restore a portion of their property and dignities to the Catholic clergy, and to have his own son baptized according to the Catholic rites. She also built the magnificent basilica of St. John the baptist at Monza, near Milan, in which in subsequent times was kept the Lombard crown, called the *iron crown* (q.v.). The Lombards were ere long fully united to the Roman Catholic church. The contests of the dukes prevented the firm consolidation of the kingdom, or any very considerable extension of its boundaries. The *edict* of the Lombard king, Rothari (638–54), declaring the laws of the Lombards, promulgated Nov. 22, 643, is memorable, as having become the foundation of constitutional law in the Germanic kingdoms of the middle ages. It was revised and extended by subsequent Lombard kings, but subsisted in force for several centuries after the Lombard kingdom had passed away. The Lombards, however, gradually became more and more assimilated to the former inhabitants of the land of which they had made themselves lords; their rudeness was exchanged for refinement, and the Latin language prevailed over the German, which they had brought with them from the other side of the Alps. But of the original Lombard language little is known, nothing remaining to attest its certainly German character except a few words and names, the very ballads in which the stories of Lombard heroes were recorded having only come down to us in Latin versions.

Liutprand (713–44) raised the Lombard kingdom to its highest prosperity. He quelled with strong hand the turbulence of the nobles, gave the finishing blow to the exarchate of Ravenna, and sought to extend his dominion over all Italy. But the popes now entered upon that Macchiavellian policy which they long incessantly pursued, of laboring to prevent a union of all Italy under one government, in order to secure for themselves the greater power in the midst of contending parties. This, with the disputes which arose concerning the succession to the Lombard throne, led to the downfall of the Lombard kingdom within no long time after it had reached its utmost greatness. The popes allied themselves with the Frankish kings, and Pepin, who had been anointed by Stephen II. to the "patriciate," i. e., the governorship of Rome, invaded Italy (754), and compelled the Lombard king Aistulf (749–54), who cherished the same ambitious designs as Liutprand, to refrain from further conquests, and even to give up some of the cities which had already yielded to his arms, which Pepin (755) bestowed upon the Roman church and commonwealth. New causes of hostility between the Frank and Lombard monarchs arose when Charlemagne sent back to her father his wife, the daughter of the Lombard king Desiderius (754–74), and Desiderius supported the claims of the children of Carloman, Charlemagne's brother. In the autumn of 773, Charlemagne invaded Italy; and in May of the following year, Pavia was conquered, and the Lombard kingdom, after an existence of 206 years, was overthrown. In 776 an insurrection of some of the Lombard dukes brought Charlemagne again into Italy, and the dukedoms were broken down into counties, and the Lombard system, as far as possible, supplanted by that of the Franks. In 803 a treaty between Charlemagne, the western, and Nicephorus, the eastern emperor, confirmed the right of the former to the Lombard territory, with Rome, the Exarchate, Ravenna, Istria, and part of Dalmatia; whilst the eastern empire retained the islands of Venice and the maritime towns of Dalmatia, with Naples, Sicily, and part of Calabria. Compare Türk's *Die Longobarden und ihr Volksrecht* (Rost. 1835); and Flegler's *Das Königreich der Longobarden in Italien* (Leip. 1851).

LOM'BARDY, the name given to that part of upper Italy which formed the "nucleus" of the kingdom of the Lombards (q.v.). It consisted of the whole of Italy n. of the peninsula, with the exceptions of Savoy and Venice, and after the fall of the Lombard kingdom, in 774, was incorporated in the Carlovingian empire. In 843 it was created a separate kingdom, but was not entirely severed from the Frankish monarchy till 888. From this time it was ruled by its own kings till 961, when it was annexed to the German empire. Out of the wrecks of the old independent kingdom now arose a number of independent duchies, as Friuli, Mantua, Susa, Piedmont, etc., and soon afterwards

the republics of Venice, Genoa, Milan, and Pavia. These republics consisted of one sovereign town, surrounded by, in many cases, a large extent of dependent territory. The Lombard cities declared themselves independent towards the commencement of the 12th c., and in 1167 were joined by their less powerful neighbors in the "first Lombard league," for the maintenance of their liberties, against Frederic Barbarossa, whom they severely defeated in 1176. In 1225 they were compelled to form the "second Lombard league" against Frederic II., and with similar success. About this time, petty tyrants arose in most of the cities, and the country was distracted by internal dissensions, which were carefully fostered by France and Germany. These two great powers and Spain strove for the possession of Lombardy. The last succeeded in obtaining it in 1540 and held possession till about 1706, when, after another dispute, the duchies of Milan and Mantua (the country bounded by the Ticino, Po, Mincio, and Switzerland), which alone now retained the name of Lombardy, came into the hands of Austria, and were designated "Austrian Lombardy." In 1796 it became part of the Cisalpine republic, but in 1815 was restored to Austria, and annexed politically to the newly acquired Venetian territory under the name of the Lombardo-Venetian kingdom. This union was dissolved in 1859 by the Italian war; Lombardy was given up to the new kingdom of Italy, Austria, however, retaining, for a time, her Venetian territory. There is now no official division called Lombardy, the country having been parceled out into the provinces of Bergamo, Brescia, Como, Cremona, Milan, Pavia, and Sondrio. Its total area was 8,264 English sq.m., with a population in 1862 of 3,261,000.

The northern districts of Lombardy are alpine in character, but the rest of the country is of extraordinary fertility, induced chiefly by the universal practice of irrigation. The country is celebrated for the products of its pasture-land and as much as 50,000,000 lbs. of cheese is annually produced in the dairies of Lombardy. Agriculture is here in a more advanced state than in any other part of Italy, wheat, rice, and maize being the principal crops; melons, gourds, oranges, figs, citrons, pomegranates, peaches, plums, and other fruits of excellent quality are largely produced. The numerous mulberry plantations form another prominent feature, and vines are extensively cultivated, though the wine produced from them is of inferior quality. Various kinds of marble, some of them of great beauty, form the chief item in the mineral products of Lombardy; a few iron mines exist in Como and Bergamo. The chief manufactures are silk, cotton, and woolen goods, flax, paper, glass, and pottery; the annual value of the silk exceeds £3,000,000. Education is very generally diffused among the people, and they are well supplied with newspapers and scientific and literary journals.

LOMBOK', an island in that crescent group in the Malayan archipelago known as the Sunda islands. It lies between Bali on the w., and Sumbawa on the e.; lat. from 8° 12′ to 9° s., long. from 115° 44′ to 116° 40′ east. Area estimated at 1480 sq.m.; pop. at 200,000, who are all Mohammedans. The n. and s. coasts are each traversed by a chain of mountains, some of which are volcanic, but the interior is a fertile valley. Rice and cotton are largely cultivated, 20,000 tons of the former being exported annually. The capital is Mataran; the principal seaport, Ampanam.

LOMBRIZ, an epizootic disease which attacks young sheep in Texas and New Mexico. Great numbers of reddish hair-like worms infest the stomach and flesh of the animals, destroying them in droves. It generally attacks those which are not well cared for, or at least proves more fatal among them. The usual remedies which are said to be attended with success are equal parts of salt, sulphur, and sulphate of iron (green copperas).

LOMÉNIE, Louis Léonard de, b. France, 1818; descended from eminent ancestors, one of whom was a victim of the massacre of St. Bartholomew's. His first literary work was a series of biographical sketches, published under the title *Galerie des Contemporaines Illustres par un Homme de Rien.* In 1845 he obtained the chair of literature in the college of France. In 1871 he became a member of the French academy in the place vacated by the death of Merimée. His *Biographies des Homme de* 1789*; Beaumarchais et son temps, études sur la Société Française; La Comtesse de Rochefort et ses Amies;* and *Mirabeau*—are among his principal works.

LOMONOZOFF, Mikhail Wasitowitz, 1711–65; b. Russia; son of a poor fisherman, who in the midst of poverty and want exhibited such hunger for knowledge and instinct for poetry as to excite the friendship of a priest, who placed him in a school of Moscow. Thence his talents procured him entrance to the university of Kiev, and to the academy of St. Petersburg. His great learning in due time secured him the position of professor of chemistry and director of the mineralogical cabinets of the university of St. Petersburg. He was sent by that institution to Germany to acquire a practical knowledge of mining and mineralogy, and while there familiarized himself with the German poets. The range and variety of his studies and authorship are remarkable. It embraces annals of the Russian sovereigns, a history of Russia, works on mineralogy and chemistry, a Russian grammar and rhetoric, original poems, and a great number of translations. He is called the father of modern Russian literature, and

his grammar is said "to have drawn out the plan, and his poetry to have built up the fabric of his native language." The life of Peter the great was the subject of his main poem, a heroic epic in two cantos, said to be unsurpassed in the language. He became one of the counselors of state, and died in middle life, crowned with the esteem and admiration of his countrymen.

LOMEN'TUM. See LEGUME.

LO'MOND, LOCH, the largest of the Scottish lakes, lies between Dumbartonshire on the w. and the counties of Stirling and Perth on the east. It is 24 m. long, is 7 m. broad at the southern extremity, though the northern half is only about a m. in width, and has an area of 45 sq. miles. Its depth varies from 60 to 600 ft., and its surface is only about 22 ft. above the level of the sea. The waters of the loch are swelled by the contributions of many streams, the chief of which is the Endrick, from the s.e.; the surplus waters are carried off by the Leven, an affluent of the Clyde. The lower portion of the loch is surrounded by a hilly but well-cultivated and finely wooded country, and the character of the scenery is in the highest degree rich and beautiful. Around the northern portion of the loch are piled high, wild, and picturesque masses of mountains —Ben Lomond on the e., and the Arrochar hills on the west. The surface is dotted over with numerous islands, which are finely diversified in their general appearance, and contribute greatly to the exquisite beauty of the scene. Several steamers ply on the lake.

LOMUS, in Hindu mythology—according to Vollmer—is the first created being formed by Brahma. Deciding to devote himself to the contemplation of divine things, in order to be undisturbed he buried himself in the ground. This pleased the gods so much that they loaded him with favors, increased and confirmed his power and piety, and assured him a duration of life surpassing even that of Brahma. Lomus is said to be 20 m. long, and covered with hairs, of which he draws out one during the lapse of each cycle of Brahma, and will die only after the last is drawn.

LOMZA, a government of Russia, formerly a part of the Polish government of Augustovo; 4,666 sq.m.; pop. 501,385. It is bounded by the government of Grodno on the e. and by e. Prussia on the n.w. Capital, Lomza.

LOM'ZA, a district t. in the government of the same name, in Poland, on the left of the Narev, a tributary of the Vistula, and 85 m. n.e. of Warsaw, played a prominent part in the history of Poland, but has never recovered from its sufferings during the Swedish wars. Lomza has a college, a gymnasium, an arsenal, and several paper-mills, and cloth and linen factories in its neighborhood. Pop. '67, 10,340.

LONA'TO, a t. in n. Italy, province of Brescia; pop. 6,462. It is situated on a height about 3 m. from the southern shore of lake Gonda, surrounded by walls, defended also by a citadel. It is in a fine silk district. The principal church is surmounted by a splendid dome. The town is of Roman origin, was devastated by war and pestilence in the middle ages, and in modern times was the scene of two great battles between the French and Austrians in 1706 and 1796, the French being in both victorious.

LONDON, the capital of the British empire, stands on both banks of the Thames, about 60 m. from the sea. The dome of St. Paul's is in lat. 51° 30′ 48″ n., and in long. 5′ 48″ west. The river here varies from 900 to 1200 ft. in width.

London, under the names *Londinium, Londinum,* and *Augusta,* was one of the chief stations of the Romans in Britain. They encircled a portion of what is now the *city* with a wall, which was rebuilt and extended in later ages. In Stow's time, the remains of the Norman or Anglo-Norman wall were about 2 m. in extent, from the Thames at the Tower to the Thames at Blackfriars. The great fire of 1666 and continual reconstructions in later ages have nearly obliterated all traces of the old wall. The seven gates which pierced it are entirely gone, *Temple Bar* being merely one of the outer bars or suburban gates.

It is almost impossible to say what is the *size* of London, because there is no boundary wall, nor any definite number of surrounding villages and parishes included within it. "London within the walls," the original city, comprises only 370 acres; "London without the walls" comprises 230 acres; then there are the city of Westminster and the borough of Southwark; the "Tower Hamlets," comprising Bethnal Green, Whitechapel, Stepney, Mile End, Poplar, Blackwall, etc.; the northern suburbs of Marylebone, Portland Town, Camden and Kentish Towns, St. Pancras, Hampstead, Islington, Dalston, Clapton, Hackney, etc.; the western suburbs of Kensington, Chelsea, Pimlico, Tyburnia, Notting Hill, Bayswater, Westbourne, Fulham, Paddington, etc.; many parishes in the center, but westward of the city; Bermondsey, Lambeth, Newington, Wandsworth, Kennington, Stockwell, Brixton, Clapham, Camberwell, Peckham, Rotherhithe, etc., in Surrey; and Deptford, Greenwich, Penge, Hatcham, Blackheath, Lewisham, Lee, etc., in Kent. The *post-office* London is larger than the *parliamentary* London; and the *police* London is larger than either. It is usual, however, now to take, as the limit of

London, the area under the operation of the "metropolis local government act," which is also adopted by the registrar-general for the census, and for the tables of mortality; it is nearly identical with the area under the control of the metropolitan board of works, and with that under the control of the London school board (established by the education act of 1870). The area of the metropolis, as thus defined, is about 78,200 acres, equal to 122 sq. miles. This area contained, in 1861, 359,421 inhabited houses and 2,803,034 inhabitants; and in 1871, 417,348 houses and 3,251,804 inhabitants. On census night, April, 1871, the exact population of the metropolis, under six different interpretations of that term, was as follows:

City of London	74,732
Parliamentary London	3,008,101
Registrar-general's London	3,251,804
Local-management London	3,264,530
School-board London	3,265,005
Police London	3,883,092

In round numbers, the dimensions may be estimated at about 13 m. from e. to w., and 9½ from n. to south. For *parliamentary* purposes, London constitutes ten boroughs—viz., city of London, Westminster, Southwark, Marylebone, Finsbury, Tower Hamlets, Hackney, Chelsea, Lambeth, and Greenwich; the first sending four members, and the others two each. For *poor-law* purposes, London is divided into 40 unions, in some cases single parishes, in others groups of parishes. The "metropolitan buildings act" of 1855—which gives some kind of official control over the ranging of houses in streets, the removal of projections and sheds, the management of rebuilding and repairs, the compulsory repair of houses in a dangerous condition, etc., divides the metropolis into 56 districts, of which 4 are in the city of London, 5 in the city of Westminster, 30 in other parts of the metropolis n. of the Thames, and 17 s. of the Thames. The city of London, as it cannot increase in size, is rapidly *decreasing* in population, owing to the substitution of large commercial establishments for dwelling-houses. Little over 70,000 persons *sleep* in the city at night, whereas nearly 700,000 enter and quit it every day.

The Thames at London is crossed by the following *bridges:* London bridge, South-eastern railway city bridge, Southwark bridge, Chatham and Dover railway bridge, Blackfriars bridge, Waterloo bridge, Charing Cross railway and foot bridge, Westminster bridge, Lambeth bridge, Vauxhall bridge, Pimlico railway bridge, Chelsea suspension bridge, Cadogan or Albert bridge, Battersea bridge, West London railway bridge, Putney bridge, and Hammersmith bridge. (The bridges at Barnes, Kew, and Richmond can scarcely be said to be within metropolitan limits.) Near and between these bridges are about 20 *steamboat piers* for the accommodation of river passengers. The *Thames tunnel*, formerly a footway under the river, 1200 ft. long, about 2 m. below London bridge, now constitutes part of the *East London railway*. A little way below London bridge is the *tower subway*, a small tunnel for foot passengers. For the accommodation of such shipping as cannot conveniently load and unload in the river, *St. Katharine's docks, London docks, Limehouse docks, West India docks, East India docks*, and *Victoria docks* have been formed on the northern shore; and the *Commercial* and *Grand Surrey docks* on the southern. The part of the Thames just below London bridge, called the *pool*, is the great rendezvous for coal-ships; below that, as far as Blackwall, is the *port*, occupied by ships of greater burden. Of *canals*, the Paddington, Regent's, and Grand Surrey are the chief.

In matters of government London is under very varied jurisdiction. The lord mayor and corporation exercise peculiar powers in the *city* in reference to tolls, dues, markets, the administration of justice, police, drainage, lighting, paving, and a variety of other matters. The city is divided into 25 *wards*, each represented by an alderman; the aldermen are chosen for life, and are magistrates by virtue of their office. The *common council* consists of 206 members, who, with the lord mayor and aldermen, form a kind of parliament for the management of city affairs. The *Mansion house* and *Guildhall* are the chief buildings for the transaction of corporate business. The *metropolitan commissioners of police* and the *metropolitan board of works* have control over the whole metropolis *except* the city. Westminster and Southwark are each under local authorities, but only in minor matters. The *drainage* is managed by two boards of works, one for the city and one for the rest of the metropolis, and has been improved by a vast and costly system of sewerage, paid for by the householders. Nearly all the drainage and sewage enter the Thames at points 12 m. below London bridge instead of in London itself; the expense of these great works has reached nearly £5,000,000. The *gas* supply is in the hands of joint-stock companies; and so is the *water* supply: the water being obtained from the Thames, and from the New river, one of its affluents. Both systems are in some degree controlled by the boards, etc., above named. In *police* jurisdiction the city of London is entirely distinct from the rest of the metropolis. In 1863 an attempt was made by the government to bring all under one jurisdiction; but the opposition of the citizens was so strong that the attempt failed. The city police, about 700 in number, are in 6 divisions, and have 7 stations; there are two police-offices or justice-

rooms, one at the Mansion house and one at Guildhall. All the rest of the metropolis is under the commissioners of metropolitan police, with head-quarters at Whitehall. There are 21 divisions, all but one (the Thames police) denoted by letters of the alphabet; the full force, officers and men, is about 8,500. There are 14 police courts, attended by 23 police magistrates, for taking cognizance of offenses within the metropolis, but outside the *city*.

The *streets* of London, extending, with lanes and courts, nearly 30,000 m. in aggregate length, depend mainly for their direction on the course of the Thames; the principal of them being nearly e. and west. One line of route extends from Hammersmith to Mile End and Bow, through Piccadilly, Strand, and Cheapside; another, beginning in the Uxbridge road, passes through Oxford street and Holborn, and joins the former at Cheapside. There is still a deficiency of wide thoroughfares for the city traffic; but a new street has lately been made from Blackfriars bridge to the Mansion house—in connection with the northern or *Victoria Thames embankment*—the two together forming a wide and handsome avenue from Westminster abbey to the heart of the city. London is very deficient in wide convenient streets running n. and south. Most of the new streets formed within the last few years are far superior in all respects to those formed fifty or a hundred years ago—except those at the outskirts, which are mostly poor and slight. Regent street and the Quadrant form the finest street in London for general effect; but the most palatial street is Pall Mall, owing to the number of *club-houses* situated there, most of which are fine buildings. Of the 50 or 60 principal club-houses in London, the *Army and Navy*, *Guards'*, *University*, *Carlton*, *Reform*, *Travelers'*, *Athenæum*, *United Service*, and *United University* are in this one street. A continuous range of fine shops extends from Pall Mall to Cornhill.

Among the buildings in London belonging to the crown or to the nation, the following are the principal: *St. James's palace*, an irregular and inelegant cluster of buildings, used for court purposes, but not as the queen's residence. *Buckingham palace*, the queen's London residence, a large but low quadrangular mass, with very inadequate court accommodation. *Marlborough house*, residence of the prince and princess of Wales. *Kensington palace*, occupied partly by royalty, partly by recipients of court favor. *Houses of parliament*, a vast structure, which has cost £3,000,000; perhaps the finest, and certainly the largest, Gothic building in the world applied to civil purposes; the river-front is 900 ft. long. *Westminster hall*, a noble old structure, of which the main hall is 290 ft. by 68, and 110 high. *Somerset house*, a quadrangular structure with a river-frontage of 600 ft.; it is mostly occupied by government offices. The *admiralty*, noticeable chiefly for the screen in front of the court-yard. The *horse guards*, the official residence of the commander-in-chief, with an arched entrance to St. James's park. The *treasury*, the *home office*, the *privy council office*, and the *board of trade* occupy a cluster of buildings in Whitehall. The *foreign and India offices* form a noble new group near Whitehall; and the *colonial* and other offices are being built immediately adjacent. The *war office*, in Pall Mall, a large but plain brick building. The *British museum* (q.v.). The *national gallery*, devoted to a portion of the national pictures, in Trafalgar square. The *museum of economic geology*, in Jermyn street, a small but well-planned building. *Burlington house*, appropriated by the nation to the royal academy and to several scientific societies. The *South Kensington museum*, a medley of buildings more remarkable for convenience than for beauty, and filled with a miscellaneous but valuable collection. The *guards' barracks*, Chelsea. The *custom house*, with a long room 190 ft. by 66, is finely situated on the river side. The *general post-office*, a noble mass in St. Martin's-le-Grand, has a central hall 80 ft. by 60, and 53 high, with a vast number of offices all around it; and a large new block of buildings just opposite, finished in 1873. The *mint*, on Tower hill, is a cluster of buildings in which the gold and silver coinage is managed (a new structure near the Thames embankment is in contemplation). The *Tower of London* is a confused mass of houses, towers, forts, batteries, ramparts, barracks, armories, store-houses, and other buildings, included within a boundary of about 900 ft. by 800, at the extreme eastern verge of the city.

London is the seat of a bishopric, which comprises about 320 benefices. The income of the bishop is £10,000 a year. St. Paul's is the cathedral for the diocese; it is situated at the e. end of Ludgate hill, extending to Cheapside, and was built by sir Christopher Wren (1675–1710) at a cost of £748,000. It is built in the form of a cross, is 514 ft. long, by 286 wide; the cross, which surmounts the ball over the dome, is 356 ft. above the marble pavement below. St. Paul's contains many monuments to illustrious persons. (Plans are in progress for an extensive and costly restoration of the interior.) *Westminster abbey*, also cruciform, is 530 ft. in extreme outer length, by 203 in width; the west towers are 225 ft. high. Henry VII.'s chapel, at the e. end, is a beautiful example of enriched Gothic. The abbey has no special connection with the see of London, but is intimately connected with some of the court and parliamentary ceremonials. It was originally a Benedictine monastery, and is said to have been founded by Sebert, king of the East Saxons (*circa* 616); enlarged by king Edgar and Edward the confessor; and rebuilt, nearly as we now see it, by Henry III. and Edward I. Here the kings and queens of England have been crowned from Edward the confessor to queen Victoria; and here many of them have been buried. The *poet's corner*, with its tombs and mon-

uments of eminent men, is a well-known spot of the abbey. *St. Savior's*, in Southwark, is the third in importance of the London churches. The largest Roman Catholic church is in St. George's fields. The largest dissenting chapel is Mr. Spurgeon's *Baptist tabernacle*, Newington Butts. There are in London nearly 1000 places of worship, of which those belonging to the church of England are rather less than one-half; the religious denominations are about 30.

Of *schools* of all kinds, there are in London about 2,000, including private, parochial, ragged, church and chapel, national, British, free, grammar, and rate-payers' board schools. Many small and inefficient private schools have lately been closed as a consequence of the opening of good public schools. The chief educational establishments are: *London university, King's college, University college, Gordon college, Regent's Park college, New college, Wesleyan college, Hackney college, training colleges* belonging to the national, British and foreign, and home and colonial school societies, *Westminster school, St. Paul's school, Charter-house school, Christ's Hospital* or the *Blue-coat school*, the *Gray-* and *Green-coat schools, Merchant-tailors' school, Mercers' grammar school, City of London school*, and two *ladies' colleges*. The new schools, which have been built by the London school board, are large and handsome.

There are about 70 alms-houses in London. The societies, associations, and institutions of a more or less permanent character, maintained for other than money-making objects, are not less than 600 in number. Of the *hospitals*, the chief are *Guy's, St. Thomas's*, the *London*, the *Poplar*, the *Westminster*, the *Charing Cross, St. George's, St. Mary's, Middlesex, King's College, University College, Great Northern*, the *Small-pox*, the *Fever*, the *Consumption*, the *Lock*, and the *Royal free hospitals. St. Thomas's hospital*, a magnificent pile, has lately been rebuilt on the *Albert* or *southern Thames embankment*, opposite the houses of parliament. *St. Luke's*, and *Bethlehem* (for insane persons), and the *foundling hospital* are special in their objects. Of the 600 institutions above alluded to, about 200 are hospitals, dispensaries, infirmaries, and asylums; while the remaining 400 are religious, visiting, or benevolent institutions.

There are law-courts, civil and criminal, of all degrees of dignity, and with various extent of jurisdiction, scattered over London. For some of the more important of them, more worthy buildings are being erected near the Strand. There are 7 sessions-houses (Old Bailey, Guildhall, Tower Hamlets, Southwark, Kensington, Clerkenwell, and Westminster). The prisons have undergone many changes within the last few years, partly owing to the decay of old buildings, and partly to changes in the law of imprisonment. At present the buildings actually used as prisons are about twelve in number, the chief being Newgate, Holloway, Pentonville, Cold Bath Fields, Milbank, Clerkenwell, Brixton, Fulham, and Wandsworth. The chief buildings in London connected with law and justice are the following: the *Westminster hall* courts of law and equity; the *Lincoln's inn* courts of equity; the *Guildhall courts;* the *central criminal court* in the Old Bailey; *ecclesiastical* and other special courts at Doctors' Commons, etc. (New buildings designed to take the place of most of these are being erected on ground cleared for the purpose between the Strand and Lincoln's inn.) What are called the *inns of court* are in some sense colleges for practitioners in the law; they comprise the *inner temple*, the *middle temple, Lincoln's inn*, and *Gray's inn;* and there are others called *inns of chancery*, comprising *Thavies's, Furnival's, Staple, Barnard's, Clifford's, Clement's, Lyon's, New*, and *Serjeant's inns*. Connected incidentally with legal matters is the *record office*, a large depository for official papers in Fetter lane. The legal practitioners in London, besides judges, etc., comprise about 4,000 solicitors and attorneys, and 2,000 barristers.

In connection with the shipping of London, and the import and export trade, the *docks* above named contain more than 300 acres of water space, and a large amount of warehouse, shed, and vault accommodation—besides warehouses in various parts of the city, away from the docks. From 6,000 to 7,000 ships enter these docks annually. Nearly all the sailing-vessels which come to London laden with coal, instead of entering docks to unload their cargoes, lie in the stream of the river, and transfer their coal to lighters, which convey it to the yards of coal-merchants, situated either on the banks of the river itself, or of the canals which run into it. One-fourth of the whole ship tonnage of England, and one-half of the *large* steamers belong to London. Of the ships that enter the port of London, about 60 per cent are engaged in the *foreign* and *colonial* trade, 40 per cent in the *coasting* trade. About 100 vessels enter the port *every day*, four-fifths British, the rest foreign. The value of all the merchandise exported from the port of London is nearly one-fourth of that of the exports for the whole United Kingdom. The imports of wheat, flour, cotton, dye-stuffs, palm-oil, and some other articles, are greater into Liverpool than into London; but London takes the lead in the imports of colonial produce, wines, and spirits. London receives about half of the total customs revenue of the kingdom, owing to the fact that duty-paying commodities constitute so large a proportion of its aggregate imports.

The principal markets of London are the *cattle market* at Pentonville, *Covent Garden* (vegetable) *market*, *Billingsgate* (fish) *market*, and *Smithfield* (meat and poultry) *market*. The *Columbia market*, Bethnal Green, presented to the corporation of the city by baroness Burdett-Coutts, has not met the anticipated want. In Bermondsey is a commercial

hide and skin market. The establishments for wholesale dealings are, of course, stupendous in character. Of coal alone, London now requires more than 6,000,000 tons annually. The whole number of distinct trades or occupations in London is about 2,000. There are about 80 *trade guilds* or *city companies* in London, many of which possess large revenues; but they do not now exert much influence on the actual course of trade and manufactures; the chief among them, called the *twelve great companies,* are the *mercers', grocers', drapers', fishmongers', goldsmiths', skinners', merchant-tailors', haberdashers', salters', ironmongers', vintners',* and *clothworkers'* companies, all of which have *halls,* in which banquets are held. The *goldsmiths', apothecaries',* and *stationers'* companies still exercise some active control over those trades. The *banks* in London, either private or joint-stock, are about 100 in number, many of which have two or more banking-houses. There are about as many *insurance offices,* some for life only, some for fire only, some for life and fire. The buildings for these banks and insurance offices are among the best in London. The *bank of England,* one of sir John Soane's most successful works, gives employment to about 1000 clerks, etc. The *royal exchange* is noticeable chiefly for sir R. Westmacott's sculpture in the pediment. The *corn exchange,* the *coal exchange,* and the *hop and malt exhange* are convenient for their purposes. The *stock exchange,* near the bank, is nearly hidden from view. The great warehouses for foreign and colonial produce lie chiefly eastward of the city; while the wholesale establishments for textile goods occupy enormous buildings in the neighborhood of Cheapside and St. Paul's churchyard. Most of the large manufacturing establishments lie either eastward or southward, the center and the w. of the metropolis being engaged in selling rather than in making. Large clusters of excellently arranged dwellings and lodging-houses for the working classes have been erected in various parts of London.

The *passenger* and *goods* traffic in London requires vast resources. There are 11 railway companies, having the termini of their lines in London, besides minor lines, more or less under the control of those companies. In addition to about 20 large passenger stations, there are at least 150 smaller within the limits of the metropolis. There is one railway n. and s. through the heart of London, and four extending nearly through it e. and west. The vastness of the local traffic may be illustrated by the fact that the *metropolitan* and *metropolitan district railways,* working in concert, dispatch about 500 trains per day, and accommodate about 30 stations, all within the limits of the metroplis, and all north of the Thames. There are in London about 140 *booking-offices* connected with inns, having relation to passenger and carrier traffic. For water-traffic there are about 50 *wharfs* and *quays* on the Thames, besides a considerable number on the regent's and other canals. There are about 1700 omnibuses and 6,000 cabs. It has been ascertained that on an average day 1000 vehicles per *hour* pass through Cheapside; and, on an average day of 24 hours, 170,000 persons and 20,000 vehicles have been counted crossing London bridge. A great length of street tramway has been formed in London and the suburbs.

Of the open places in the metropolis, the *parks* are the most important. *Hyde park, St. James's park,* the *Green park, Regent's park, Victoria park, Kensington park, Finsbury park, Southwark park, Kennington park,* and *Battersea park,* all belong to the nation, and are purposely kept out of the builders' hands; they are most valuable as "lungs" to London. *Primrose hill* and *Hampstead heath* may be included in the number. The *Zoological gardens, Horticultural gardens,* and *Botanic gardens* are beautiful places, belonging to private societies. The *cemeteries,* substitutes for the old churchyards, are at Highgate, Finchley, Stoke Newington, Mile End, Kensal Green, Bethnal Green, Brompton, Nunhead, Colney Hatch, Camberwell, Norwood, etc. Of places of amusement, there are 3 opera-houses, about 30 theaters, 12 music-halls and concert-rooms of large dimensions (including *Albert hall*), a much larger number of smaller size, and very numerous exhibition-rooms of various kinds, of which the *annual international exhibitions* building at South Kensington was opened in 1871. Of public *columns* and *statues* in open places, London contains a smaller number than is due to its size. The chief are the following: The *Albert memorial,* Hyde park; the *Monument,* Fish street hill; *Nelson column,* Trafalgar square; *Wellington statue,* Hyde park corner; *Achilles statue,* Hyde park; *Guards' memorial,* Pall Mall; *Crimean monument,* Westminster; *York column,* Waterloo steps; *Havelock's* and *Napier's* statues, Trafalgar square; *Outram's statue* and *Cleopatra's needle* on the Thames embankment, etc. Of *drinking fountains,* which are numerous, the finest was presented to Victoria park by baroness Burdett-Coutts. There are very cheap *public baths and wash-houses* in London.

London is now supplied with hotels in a manner adequate to its size and importance. The best of those belonging to the railway companies are the *Great Northern,* the *Midland,* the *Victoria and Euston,* the *Great Western,* the *Grosvenor,* the *Charing Cross,* and the *Cannon Street.* Of the others, the only one grand in appearance is the *Langham.*

LONDON (*ante*). Following is the table of population for the metropolis from the tables of the registrar-general for 1871:

Part of Middlesex.						Part of Surrey and Kent.	
West Districts.		*Central Districts.*		*East Districts.*		*South Districts.*	
Kensington	283,153	St. Giles	53,556	Shoreditch	127,164	St. Saviour } Southwark	175,049
Chelsea	71,089	Strand	41,339	Bethnal Green	120,104	St. Olave } Southwark	122,398
St. George, Hanover square	155,936	Holborn	163,491	Whitechapel	76,573	Lambeth	208,342
Westminster	51,181	London city	75,983	St. George in the East	48,052	Wandsworth	125,060
North Districts.				Stepney	57,690	Camberwell	111,306
Marylebone	159,254			Mile End, Old Town	93,152	Greenwich	100,600
Hampstead	32,281			Poplar	116,376	Lewisham	51,557
St. Pancras	221,465					Woolwich	73,380
Islington	213,778						
Hackney	124,951						

In Middlesex	2,286,568
" Surrey	742,155
" Kent	225,537
Total population	3,254,260

LONDON, chief city of the co. of Middlesex, Ontario, Canada, is situated at the junction of the two branches of the river Thames, about 114 m. w.s.w. from Toronto, with which it is connected by the Great Western railway. The situation, whose fitness for a town was recognized by gen. Simcoe as early as 1784, only began to be cleared and laid out in 1825; but such has been the rapidity of the city's growth that, in 1852, the population had risen to 7,124; in 1857, to 16,000; and although it had fallen at the census of 1861 to 11,555, it has again (1871) risen to 15,826. With the suburbs, it is about 20,000. When the city was called London, the river, which had formerly been known by an Indian name, received that which it now bears; a Westminster and a Blackfriars bridge were thrown over it; and the names given to the principal streets and localities, still seem to indicate a desire to make the westernmost city of Canada a reproduction, as far as possible, of the capital of England. The Thames will probably be made navigable as far as London, to give it a communication by water with the lakes, and it has already an outlet by railway to every part of the American continent. The center of a rich agricultural district, London carries on a large trade in the produce of the country, while there are also many foundries, tanneries, breweries; printing-offices, issuing three daily and several weekly newspapers; and, outside the city, large petroleum refineries. Huron college, Hellmuth college, and Hellmuth ladies' college are educational institutions recently established.

LONDON, Custom of, in English law, is peculiar in several respects, and the laws there differ in those respects from the rest of the country. Thus, in the city (and by the city is meant only the city proper, or a small portion of the metropolis), a law of foreign attachment exists, which resembles the Scotch law of arrestment, by which a creditor may attach or seize the goods or debts of his debtor, in the hands of third parties, to abide the result of an action to be brought. The city of London also had a custom until recently which resembled the Scotch law of *Legitim* (q.v.) and *Jus Relictæ* (q.v.), by which a person at death could not by will disinherit his children, or leave his wife destitute. This custom was abolished by the stat. 19 and 20 Vict. c. 94. There is also a peculiar custom by which the common council elect their own sheriffs, instead of the crown electing them. There are also several other customs relating to local offenses of minor importance.

LONDON CLAY, or Lower Eocene Strata (q.v.), are a series of beds occupying the lower basin of the Thames from Hungerford to Harwich and Herne bay; and also an extensive triangular region in Hampshire and the neighboring counties, whose base extends along the coast from Dorchester nearly to Brighton, while its apex reaches to Salisbury. The beds are arranged in three sections: London clay proper and Bognor beds, maximum thickness 480 ft.; plastic and mottled clays and sands, maximum thickness, 160 ft.; Thanet sands maximum thickness 90 ft.: total, 730 feet.

The London clay proper consists of tenacious dark-gray and brown clay, with layers of septaria, which occur in sufficient quantity in the beds near Harwich and along the coast of Harwich to be used for the manufacture of Roman cement. In Hampshire the clays are bluish, and have running through them bands of sand, sometimes compacted into hard stone, called Bognor rock. In both basins the clay rests on a thin bed of variously colored sand and flint pebbles. The London clay is rich in fossils. Many palm and other fruits have been described by Bowerbank from the island of Sheppey: masses of wood, often bored by the teredo, are not unfrequent. The mollusca belong to genera which now inhabit warmer seas than those of Britain, such as cones, volutes, nautilus, etc. About fifty species of fish have been described by Agassiz from Sheppey, among which are a sword-fish and a saw-fish. The remains of several birds and pachydermatous animals tell of the neighborhood of land; and the numerous turtles,

with the crocodiles and gavials, whose remains are associated with them, no doubt infested the banks of the great river which floated down the Sheppey fruits.

The plastic clays, or Woolwich and Reading series of Prestwich, are very variable in character, consisting chiefly of clays and argillaceous sands, which are used, as their name implies, in the manufacture of pottery. They contain a mixture of marine and fresh-water shells, showing that they have been deposited in estuaries. They attain their maximum thickness of 90 ft. in the isle of Thanet, and thin out westward, till at Windsor they are only 4 ft. thick—beyond this they entirely disappear.

LONDON CONFERENCES. The first diplomatic meeting so designated was held in 1826 and the following years, for the regulation of the affairs of Greece; the next one was held in 1830, to arrange terms of agreement or of separation between Belgium and Holland. The terms of agreement proposed not being accepted by the disputants, Holland made an appeal to arms; but the capture of Antwerp by the French, and the blockade of their coast by the English and French fleets brought the Dutch to agree to a treaty of definitive separation, May 21, 1833. A third conference was held in 1840, on the Turko-Egyptian question, in which France refused to take part. In 1851 a protocol was signed in London by the representatives of all the great powers, declaring the indivisibility of the Danish monarchy (inclusive of Sleswick and Holstein).

LONDONDERRY, a maritime co. of the province of Ulster, in Ireland, 40 m. in length by 34 in breadth, bounded n. by the Atlantic, e. by the county Antrim, and in part by lough Neagh, s. by Tyrone, and w. by Donegal. Its area is 816 sq.m., or 522,315 acres, of which 91,759 are mountain, bog, waste, water, towns, etc. The pop. in 1871 was 173,906, of whom 77,358 were Catholics, 58,779 Presbyterians, 32,079 Episcopalians, and nearly 1000 Methodists. The surface of Londonderry is irregular. From the eastern boundary it rises gradually toward the w. for a distance of about 10 m., where commences an elevated district, rising in several points to a considerable height; Sawell, on the southern border, being 2,236 ft. high. On the western side the surface falls gradually towards lough Foyle. The coast-line along the Atlantic is generally bold and precipitous. The shore of lough Foyle is in most places an unvarying plain. The county may be divided longitudinally into two great geological districts, separated from each other by the river Roe. In the western, which is mountainous, the mica-slate prevails, accompanied in some places by primitive limestone. In the eastern the mica-slate is overlaid by a succession of varying beds, capped, as in the adjacent Antrim district beyond the Bann, by a vast area of basalt, the dip of which, however, is the reverse of that on the opposite side of the river, and increasing in thickness towards the north, where in one place it reaches a depth of 900 feet. Many of the strata contain iron, and the ironstone of the mountain called Slieve Gallion was formerly worked, but the mining operations have been abandoned, from the failure of fuel. The soil is of a very mixed character, the greater part, with the exception of the alluvial spots on the banks of the several rivers, and of a considerable open district which stretches southward to Tyrone, being ill suited for wheat, or indeed for any cereal crop. In the year 1876, 188,926 acres were under crops of all kinds. The number of cattle was 114,376; of sheep, 34,322; of pigs, 38,161. The total value of cattle, sheep, and pigs was £1,594,359. The system of agriculture has been materially improved under the impulse given by the London society upon the large estates which it holds in the county. The principal rivers are the Foyle, the Faughan, the Roe, and the Bann. The first is navigable as far as Londonderry for ships of 800 tons burden. The Bann, besides being a great source of motive-power for the staple manufacture of Ulster, that of linen, is also celebrated for its salmon-fisheries, which are of great value. The chief towns are Londonderry city (q.v.), Coleraine, Newtown-Limavady, and Magherafelt. Londonderry was in ancient times the seat of the great septs of O'Loughlin and O'Neill, and of their tributary sept of O'Cahan, or O'Kane. At the immediate period of the invasion the English under John de Courcy attempted a settlement, but were forced by the O'Neills to withdraw. A small garrison within their colony was established near the Antrim border, at Coleraine, upon the river Bann; but from the 14th till the 16th c. their tenure was little more than nominal; and although a number of forts, with a considerable garrison, were erected upon the river Foyle in 1600, it was not till the flight of the celebrated Tyrone and O'Donnell that the English occupation of the district was consummated, their forfeited lands being granted by the crown to the corporation of London, who still retain them, the management being vested in a body, 26 in number, who are elected by the common council, one half retiring each year. The incorporation, by charter, of this body in 1619 led to the formation of the county, called, from this circumstance, Londonderry. Portions of the county were assigned to the several city companies, the unassigned portions being held by the society. The memory of the confiscation long rankled, and perhaps still lingers, in the minds of the dispossessed Irish and their descendants; but in material prosperity the district underwent a rapid and marked improvement. The agriculture is in a condition considerably in advance of the majority of Irish counties, and the domestic manufacture of linen, in former times, added materially to the comfort of the population. Of late years, however, this manufacture, in all its branches, has been transferred for the most part to large establishments. There is considerable export and import trade at the ports of Derry and Portrush, which is the seaport of Coleraine.

The former has become a port of call for the Canadian steamers, which touch on their outward and homeward passage at the entrance of lough Foyle. The number of national schools in Londonderry in the year 1861 was 388, attended by 20,696 pupils. In 1875 there were 31,488 pupils. Londonderry returns two members to the imperial parliament.

LONDONDERRY, CITY OF, a seaport, and a corporate and parliamentary borough, capital of the above county, situated on the river Foyle, and distant from Dublin 144 m. n.n.w. Pop. in 1871, 24,242. It returns one member to parliament. Londonderry arose under the shadow of a monastery founded here in the 6th c. by St. Columba. It was pillaged more than once by the Danes, and was occupied, but with many vicissitudes, by the English at the invasion. The town formed part of the escheated territory granted to the London companies, and under their management the city arose to some importance, and was strongly fortified. In the Irish war of the revolution Londonderry threw itself earnestly into the cause of William of Orange, and closed its gates against James II. The siege of Londonderry is one of the most celebrated events in modern Irish history, and its memories are among the most stirring of the occasions of party animosity. Since that date the city has steadily grown in extent and prosperity. It is beautifully situated on the left bank of the Foyle, upon a hill which overlooks the river. The walls are still preserved, and form an agreeable promenade; they surround a part of the town one mile in circumference, but the buildings have extended beyond them. A square from which the four main streets diverge is called the Diamond. The left bank of the river is connected by an iron bridge, 1200 ft. in length, with an extensive suburb called Waterside. The cathedral dates from 1633. A handsome Roman Catholic cathedral has been erected. The court-house also is a building of some pretensions, and the historical events above alluded to are commemorated by a triumphal arch erected in 1789, and a column in honor of the rev. George Walker, who was governor of the city during the memorable defense, of which he was himself the great organizer and inspirer. There are several important educational foundations, one of which, Gwyn's school, has an income of £1870; Magee college, founded in 1865, is an important institution. The arrangements and appliances of the port are on a good scale. Vessels of 500 tons can discharge at the quays, and there is a patent slip capable of receiving vessels of 800 tons. Steamers ply to Liverpool, Glasgow, and Belfast: there is railway communication with Dublin and Belfast, as well as a considerable advance towards direct communication with the western coast, and the lough Swilly line is carried north to Buncrana. In 1875, 1429 vessels of 273,392 tons entered, and 905 of 204,249 tons cleared the port. The chief manufactures are flax-spinning, distilling, brewing, rope-making, and tanning. There is also an extensive salmon-fishery.

LONDONDERRY, CHARLES WILLIAM STEWART VANE, Marquis of, 1778–1854, b. England. Distinguished both as a soldier and diplomatist in the English service from the beginning of the French revolution until the fall of Napoleon in 1815, and a member of the congress of Vienna the latter year. His surname of Vane was added on his marriage with a great heiress of that name. He is the author of a *History of the Peninsula War* in Spain; editor of the correspondence of his brother, lord Castlereagh; and constructor of the harbor of Seaham, England, out of his wife's estate.

LONDONDERRY, ROBERT STEWART, second marquis of, b. at Mount Stewart, Down co., Ireland, June 18, 1769, eldest son of Robert, first marquis, who represented the county of Down many years in the Irish parliament. Educated at the grammar-school, Armagh, and at St. John's college, Cambridge, he entered the Irish parliament in 1789, although then under age. In 1796 he became viscount Castlereagh; and in 1798 he was made chief secretary for Ireland. It was the year of the insurrection and the French invasion, and some allowance must be made for the terrible severities employed by the Irish government. Yet the cruel part he acted or tolerated in Ireland, in the suppression of the rebellion, and effecting the union, always weighed upon his reputation. In 1802 he was appointed president of the board of control, in the Addington administration. In 1805 he was promoted to the seals of the war and colonial department, but resigned, with the whole of the cabinet, on Pitt's death in 1806. In the following year, he resumed the office of war minister, when he organized the disastrous Walcheren expedition. Mr. Canning, then foreign secretary, attacked lord Castlereagh on this account with much acrimony and personality. The result was that both resigned, and a hostile meeting took place between them (Sept. 21, 1809), in which Canning was wounded. In 1812, after the assassination of Mr. Perceval, lord Castlereagh became foreign secretary, a post which he held during the period illustrated by the military achievements of the duke of Wellington. By this time the general direction of British policy was unalterably fixed by circumstances, and lord Castlereagh has at least the merit of having pursued this fixed course with a steadiness, and even obstinacy, which nothing could abate. He was the soul of the coalition against Bonaparte, and it was only by his untiring exertions, and through his personal influence, that it was kept together. He represented England at the congress of Vienna in 1814, at the treaty of Paris in 1815, and at the congress of Aix-la-Chapelle in 1818. While his foreign policy was favorable to the principles and policy of the "holy alliance" abroad, he constantly recommended arbitrary and despotic measures at home. As the leader of the Liverpool government in

the lower house, he carried the suspension of the habeas corpus act in 1817, and the "six acts" or "the gagging bills," as they were called, of 1819—measures which will forever stamp his name with infamy. The retirement of Canning from the ministry rather than be a party to the prosecution of queen Caroline (1820), threw the whole weight of business on lord Castlereagh. By the death of his father in 1821 he became marquis of Londonderry; but his mind became deranged, and he died by his own hand at his seat at Foot's Cray, Kent, Aug. 12, 1822. The populace witnessed the funeral procession in silence; but when the coffin entered the walls of Westminster, a loud and exulting shout rent the air, which penetrated into the abbey, and broke upon the stillness of the funeral ceremony. This statesman, looked upon by one party as a paragon of perfection, has been characterized by the other party as "the most intolerable mischief that ever was cast by an angry providence on a helpless people."

LONDON PRIDE, *Saxifraga umbrosa*, a perennial evergreen from southern Europe. It was brought to Great Britain and cultivated as a garden plant, but soon spread over the fields, especially in Ireland, where it is known as St. Patrick's cabbage. Flower stems, 6 to 12 in. high, bearing a loose panicle of small pink flowers marked with spots of a deeper color. It is used for making borders in gardens.

LONDON UNIVERSITY. When University college, London, was first established (in 1825), it was known as London university, although a mere joint-stock undertaking. A change took place in 1836, when it received a charter as *University college*. At the same time, by another charter, London university was established—not a building for teaching, nor a body of teachers and scholars, but a body of persons empowered to examine candidates and confer degrees. As this second charter was only valid during "royal will and pleasure," it required to be renewed at the death of William IV., and the accession of Victoria; and a new charter was accordingly granted, Dec. 5, 1837. Additional powers were given, July 7, 1850; and a wholly new charter was signed April 9, 1858, instituting many changes in the functions and arrangements of London university; again a wholly new charter, Jan. 6, 1863, with supplement (Aug. 27, 1867), admitting women to certain special examinations. *University college, London*, is still carried on in Gower street, the original spot; but the *university of London*, or London university, after occupying different apartments granted by government, is now established in a special building in Burlington gardens (since 1870). The body consists virtually of a chancellor, vice-chancellor, 36 fellows, and an indefinite number of graduates. The *chancellor* is appointed for life, or during royal pleasure, by the crown. The *vice-chancellor* is annually elected by the fellows from among their own body. The 36 *fellows* were named by the crown in the charter of 1858, for life; but as vacancies occur, the crown and the university fill them up in a mode that gives some control to each. The *graduates* are those who, at any time since 1836, have had degrees (*bachelor*, *master*, or *doctor* of certain faculties) conferred upon them by this university. The *senate* is composed of the chancellor, vice-chancellor, and fellows, and has the power of making the whole of the by-laws for the government of the university—within certain limits prescribed by the charter, and with the approval of the secretary of state. The *convocation* is composed of all the graduates, except those who have taken the lower degrees within less than two years; it meets occasionally, to vote and decide upon several minor matters; but the charter seems to confine all real power to the senate.

When the new charter was given, in 1858, there were 47 colleges and collegiate schools in connection with London university—two in the colonies, and the rest in the United Kingdom. The number was later increased; the secretary of state and the senate having the power of deciding what additional establishments shall be included. But since 1863, it is no longer required that candidates for examination should be certificated scholars of any of these institutions: everything is thrown open, subject to pleasure of senate. *Examiners* are appointed by the senate, which also defines the extent and mode of examination. By the charter of the university, theology is entirely excluded. Yet there is an optional scriptural examination under by-laws. The degrees obtainable are those of *bachelor* and *master of arts*, *bachelor* and *doctor of medicine*, *bachelor* and *doctor of laws*, *bachelor* and *doctor of science*, *bachelor* and *master of surgery*, *bachelor* and *doctor of music*, and *doctor of literature*. There are examinations for women, distinct from men's, in literature and science combined; and these first general examinations may be followed up, at will of candidate, by special examinations for certificates of higher proficiency in particular subjects.

The number of candidates for matriculation in 1876 was 1071, 486 of whom passed: for B.A. (*final*), 141; 59 passed: for M.A., 17; 11 passed: for B.SC. (*final*), 41; 22 passed: for D.SC., 7; 5 passed: for LL.B. (*final*), 22; 13 passed: for M.B. (*final*), 34; 23 passed: for M.D., 17; 11 passed. General matriculation examination must be undergone a certain time previously by candidates for any degree.—London university stands in no special relation to King's college (q.v.) in London.

LONG, ELI, b. Woodford co., Ky., 1837; graduated at the Frankfort, Ky., military school in 1855, and in 1856 was appointed a second lieut. of cavalry in the army of the United States; served for a time with his regiment in conflicts with Indians. In May, 1861, he was promoted to a captaincy, and in 1863 became col. of the 4th Ohio cavalry. He was actively engaged in the most important campaigns at the west.

much of the time commanding a brigade. In 1864 he was appointed brig.gen., and in 1865 he led his division of cavalry in the capture of Selma, Ala., receiving a severe wound in the head. In 1867 he was placed upon the retired list with the full rank of maj.gen.

LONG, GEORGE, M.A., a distinguished classical scholar, was b. at Poulton, in Lancashire, in 1800, educated at Trinity college, Cambridge, where he obtained the Craven scholarship in 1821. Long became chancellor's medalist in 1822, and subsequently fellow of his college. In 1824 he accepted the professorship of ancient languages in the university of Virginia, United States; but returned to England in 1826, to become professor of the Greek language and literature in the London university. This office he resigned in 1831, when he commenced to edit the *Journal of Education*, published by the society for the diffusion of useful knowledge; but probably the greatest labor—the *magnum opus*—of his life was his editing for eleven years (from 1832 to 1843) the *Penny Cyclopædia*, to which he was also one of the most valuable contributors. At the conclusion of the 27th volume, honorable mention is made by the society, and by the publisher, Mr. Charles Knight, of Long, "by whose leaning, unwearied diligence and watchfulness, unity of plan has been maintained during eleven years, and error, as far as possible, avoided." In the midst of these arduous duties, Long joined the inner temple, and was called to the bar in 1837. In 1846 he was chosen by the benchers of the middle temple to deliver a three years' course of lectures on jurisprudence and civil law. In 1849 he became professor of classical literature in the Proprietary college at Brighton, which appointment he held till 1871. Long is one of the best classical editors that England has produced; he is also one of the first authorities on Roman law. His merits as a translator are no less great, as evinced in his *Selections from Plutarch's Lives; Thoughts of Marcus Antonius*, etc. Long has contributed extensively to Smith's Classical Dictionaries; and, besides editing Cicero's *Orations* and Cæsar's *Gallic War*, has published an *Analysis of Herodotus; France and its Revolutions*, etc. In 1873 he was granted a pension of £100.

LONG, LOCH, a well-known loch in the w. of Scotland, extends northward from the firth of Clyde for about 24 m., between the counties of Argyle and Dumbarton. It has an average breadth of about a mile; and its banks, consisting, for the most part, of steep acclivities, abound in striking and picturesque scenery. At its head is Arrochar.

LONG, STEPHEN HARRIMAN, 1784–1864; b. Hopkinton, N. H. After graduating at Dartmouth in 1809, he became a teacher, but in 1814 was appointed 2d lieut. in the U.S.A., corps of engineers; was brevetted maj. in 1816, lieut.col. in 1826, and in 1861 was made chief of topographical engineers, with rank of col. His explorations began in 1816, when he made under great difficulties a survey of the Mississippi and its branches, which at once brought him into public notice. Soon after he led an expedition from the Mississippi to the Rocky mountains, one of the noblest peaks of which bears his name. The results of these arduous undertakings are to be found in works on the subject by Edwin James and W. H. Keating (1823 and 1824). The introduction of railroads furnished col. Long a grand opening for the exercise of his energy and ability. He was concerned in the construction of many of the principal roads of the south and west, and was especially successful in bridge-building. He was the first to suggest the application of the rectangular trussed frame to bridges. He was also extensively employed in the improvement of rivers and harbors. In 1863 col. Long retired from the U.S. army, but still engaged in many enterprises. The long record of remarkably varied and successful labor in every branch of his profession was closed by his death at Alton, Ill

LONGACRE, JAMES BARTON, 1794–1869; b. Delaware co., Penn.; served an apprenticeship with the eminent engraver, Murray, of Philadelphia, and was afterward for many years engaged in illustrating American works. He was associated with James Herring in the preparation of the *National Portrait Gallery of Distinguished Americans*, a work in 4 vols., published 1834–39. In 1844 he was appointed engraver of the U. S. mint, and retained that post until his death. He was the designer of the modern gold coinage of the United States, and superintended the work of remodeling the gold coinage of Chili.

LONGAN, *Nephelium longan*, one of the finest of fruits, of the same genus with the litchi (q.v.), but reckoned superior to it. The tree which produces it is a native of China and of other eastern countries, at least as far w. as the mountainous regions on the eastern frontier of Bengal. It is much cultivated in China. The leaves are pinnate, with few leaflets, the leaflets oblong, the flowers in lax panicles. The fruit is globose, or nearly so. It is imported into Britain in a dried state. It has been produced in Britain by the aid of artificial heat.

LONG-BOAT, a strong and seaworthy boat, formerly the largest carried by a ship, but now generally superseded by the launch (q.v.).

LONG BRANCH, a village in Monmouth co., N. J., includes the village proper, about a mile from the ocean, and the beach with its hotels and arrangements for bathing; pop. 5,000. It is one of the leading watering-places in the United States, and is annually, in the season, the residence of as many as 30,000 visitors from all parts of the

country. Among the principal hotels are the East and West End, United States, Howland's, the Metropolitan, and Leland's. Here also are the summer residences of a number of distinguished persons from New York, Philadelphia, and other cities. Communication is had with New York by steamboat and direct railroad, the latter opened in '75. The village is fully supplied with shops, in some instances branches of large establishments in New York. There are 6 churches, some manufactories, and 1 weekly newspaper, which becomes a daily during the season. The beach is unequaled in extent and convenience in this country; and, during the months of July and August, when crowded with bathers in striking costumes, and throngs of spectators in fashionable attire, presents a scene of singular brilliancy.

LONGCHAMPS, a part of the Bois de Boulogne w. of Paris, for centuries the resort of the pleasure-seekers of that city; still one of the most brilliant promenades in the world, and the site of the principal race-ground of France. It has an interesting history. As early as the 13th c. the abbaye of Longchamps was founded by Isabel, sister of Saint Louis. Monasteries, nunneries, and hospitals gathered round it as they were founded and endowed in successive reigns of the kings of France, until the place at one time became the seat of forty religious organizations. Before the time of Henry IV. they had become the scene of corrupt practices, so that he seems to have had no difficulty in taking Catherine de Verdun, a nun of the age of 22, from the convent to be his mistress. Vincent de Paul, writing to cardinal Mazarin in 1652, says that "this convent for 200 years has been marching towards total depravity of manners to ruin. Its parlors are open to all, even to young gentlemen without parents; the brothers and rectors do not object. The lady *religieuses* wear their garments immodestly and carry gold watches. When war forces them to take refuge in the city they lend themselves to scandal, and go alone and in secret where they are desired." A century before out-door preaching had attracted great crowds from Paris to Longchamps, where, under cover of religious fervor, license found a cloak. In 1521 pope Leo X., by a bull, accorded to the religious organizations of Longchamps the duty of commemorating the miracles of the princess Isabel by services on the last day of August of each year. This became a great fête day, attracting multitudes from Paris. On Mt. Valerian there dwelt many hermits and other religious persons. These also attracted crowds of people at all times who made Longchamps their meeting-place, going to and fro. Centuries before the revolution of 1789 Longchamps was such a resort for the people of Paris that a French writer alludes to it as "a fluxion of these people." In the reign of Louis XV. three days of holy-week were devoted by the rank and wealth of the court to pilgrimages to the abbaye of Longchamps. A French writer of that time remarks of these occasions: "Pleasures and devotions first marched abreast, but pleasures soon stepped to the front." Religious singing became the rage, because it brought together the *beau monde* of Paris, and the beautiful "recluses" of the convent. Crowds went from Paris to hear the delightful singing there, and the training of the church was a school for the opera. Longchamps became the frequent theater of tumultuous crowds. Before the revolution archbishop Beaumont of Paris ordered the church closed on the days when those pleasures of the holy-week had become a scandal to the church; but the gay people from the city found means to continue their reunions elsewhere adjacent to the convent walls.

Such was the character and the popularity of this place of resort when the ordinances of the revolution in 1789–90 confiscated the lands of such religious organizations to the state. The Longchamps properties were sold to speculators. The hammer of innovation destroyed all its monuments of that convent era, of which it had become the most conspicuous shame. There now remain no vestiges of all that history tells us of them. But the same gay throngs that for four hundred years have surged out from Paris to these fields now walk and ride to the race-grounds and park that have taken the place of the buildings and garden of the abbey of Longchamps.

LONGET, FRANCOIS ACHILLE, 1811–71; b. Bordeaux, France; studied medicine and surgery in Paris; became member of the academy of medicine in 1844, and since, professor of the faculty of medicine, member of *l'Institut*, and imperial surgeon of the *legion d'honneur*. As early as 1836 he became eminent for his investigations, and later, pre-eminent for his studies of the spinal marrow and its functions, the action of electricity on the nervous system, the mixed nerves, the classification of brain nerves, the laws governing the excitability of nerves, and their connection with the muscular fibers. He is credited with very interesting explanations of the action of the lungs, the voice, the saliva, and the effects upon the nervous system of the exhalation of sulphuric ether. His published works embrace treatises, reports, and essays on all the above, and many other subjects pertaining to medicine and physiology.

LONGEVITY, prolonged life in plants and animals. This article refers exclusively to human longevity. The subject has attracted attention in all ages, but especially since the more recent and systematic study of biology. It may be viewed with reference to individuals, to families, and to nations. There have been many noted examples of great prolongation of life in individuals, in some of which the history of their progenitors is not given, but enough cases have been observed in which long-lived people have descended from a long-lived stock to show that longevity is a hereditary transmission; therefore, individual and family longevity are intimately connected. Attention to hygienic

laws to a greater degree than that which has been observed by parents, will, as a rule, prolong the life of an individual beyond that of the parents, but it will probably not materially alter the average number of years to which certain families attain. So also of nations, a certain number of generations is a measure of the longest span of life of the individual. The extreme limit seems to be five generations: that is to say, those who attain the greatest age in a nation or race of men may live to see the fifth generation of their descendants. Among the Indo-European races this, as a rule, requires that the life of the individual shall be prolonged to about 120 years. In China, men of less that 100 years of age often live to see their grandchildren to the fifth generation, and all races other than the Caucasian come to maturity sooner than that race, one generation following another more frequently; and it may be taken as a rule that the number of generations and fractions of generations of a people is the measure of the span of life among them. Some remarkable instances of longevity have been observed among African races, and there are many well-authenticated cases where individuals have lived considerably beyond 100 years, but none of them reach the extreme age of the Caucasian. A person who exceeds the age of three-score and ten years may be said to have arrived at a period of longevity. The average duration of life in Europe is from 26 to 33 years, but it is found to be greater among those who are in comfortable circumstances than among the poor. The cause of this is a question about which there is a difference of opinion. It is held by some that the mode of living among the well-to-do increases the physical powers, thus tending to prolong existence. Others, again, although admitting that good living, when not luxurious, tends to prolong life, maintain that the poorer classes are naturally shorter-lived, and are poor because of inherited qualities of mind and disposition which tend to place them in subordinate circumstances. The truth probably is between these two opinions. Many people, doubtless, are poor from natural improvidence and weakness of body and of character, and they are among the short-lived. Others are poor from various circumstances; from want of desire for riches, or from a natural self-reliance, or absence of fear for the future as regards temporal things, and some of these latter often furnish instances of great longevity. There are certain classes of persons who, by fortuitous circumstances, such as happy intermarriage with those living lives calculated to strengthen their constitutions, have produced a tendency to longevity, and who transmit this tendency to their descendants, but they are not exclusively found in any one social condition.

The chief physical characteristics of longevity may be enumerated as follows: 1. Medium weight and medium height, although this is subject to many exceptions. The limbs, especially the lower, rather less than half the length of the whole stature, which is the standard in art, and was instituted by the Greek sculptors. 2. Harmonious proportions (except as to the art standard of stature), rounded and firm joints and limbs, regular features, and a calm expression of countenance, a full chest and a head and neck so placed as to give a graceful and easy bearing. 3. The chin and lower jaw, when full and well formed, are signs of longevity, but not without many exceptions, for prolonged life is often possessed by those who have retreating chins and rather defective lower jaws. The indication, however, holds good, as a rule, and whatever elements of longevity such persons have are probably inherited from ancestors who had well formed lower jaws. 4. The mouth is a feature of considerable importance as an indication of longevity. A firm, rather thin lip, at least one that is not pouting, or has not a wide red border, is a sign of firmness of fiber and vigor, especially of endurance. But there are many exceptions; and when a person has other strong characteristics of longevity this sign should not have too much weight. An incurved or inverted rather than an everted upper lip, and having a firm expression, is not an unfavorable sign, even though rather thick. 5. A rather prominent and well developed nose, in harmony with a capacious respiratory apparatus and a well-developed sensory organization, is a feature entitled to consideration; but it also has many exceptions, probably from inherited peculiarities on one side of the family, which, however, do not materially diminish the tendency to longevity in the majority of such inheritors. 6. The ear, perhaps, furnishes the most important indications of longevity, and in its form, development, and position there may be traced more hereditary characteristics, as well as evidences of individual constitutional strength, than in any other feature. A small, ill-shaped ear is very rarely carried by a long-lived person, if ever; never, if its center is placed much above the level of the wings of the nose. If such an ear is also thin and has a weak look, its possessor certainly has a defective constitution, with strong consumptive tendencies. A full, moderately fleshy ear, called a pulpy ear by artists, is a sign of a vigorous constitution, and also of longevity if placed rather low down and at a good distance from the eye, thus giving room for the various cerebral ganglia which are situated at the base of the brain and have much to do with the harmonizing of physiological functions. If the ear is rather large, and with a well-developed lobe, held firmly to the angle of the jaw, the indications of vigor and long life are increased. Other indications, those of intellectuality, character, etc., are furnished by the formation and size of the ear, but they do not particularly concern the subject of this article. In regard to the complexion, long-lived people vary from light to dark, but the skin is usually smooth and healthy.

Notwithstanding that an inherited strong constitution is the foundation of a long

life, exposure to inclement weather, or an unhealthful climate, or various hardships and privations, with violations of hygienic laws, may produce decay of the physical powers and degeneracy in two or three generations the strong tendency to the recurrence of the original type of constitution will, under favorable circumstances, cause a regeneration of stock. It is also probable that continued breeding under favorable circumstances of stock not in the highest physical condition, will tend to its improvement. To what degree improvement of the human race might be carried, it is impossible to say with confidence. We do not know our physical history with sufficient exactness to venture far upon such speculations, but, if we take the opinions of a majority of the scientific world of the present day, the race has been constantly improving—in fact, has been developing from some form much inferior. There are many, however, who believe that the Bible account, though perhaps too fragmentary for a scientific basis, is a revelation, and that we were created physically perfect. Accepting this view, to what age did our earliest progenitors survive? This is a question that has not been settled, even by theologians, and therefore will not be discussed here; but, if greater than at present, it might perhaps be recovered by an observance of mental, moral, and physical laws, as tending to the recovery of the normal type of constitution. It is possible that, under any view of the creation of man, human life might be made to increase in length of days, although history shows that its duration has varied but little in 4,000 years.

Moderation and regularity in eating, drinking, and sleeping are conducive to longevity, and those who observe proper habits may accomplish immense labors with no apparent injury to themselves. Scientific studies and philosophical contemplation, if not pursued with too much ardor, do not tend to shorten life. Clergymen are said to be the longest-lived, as a class, of any in England. Poets, as a rule, are not as long-lived as philosophers, although Sophocles is said to have lived 90 years. Goethe was in his 84th year when he died, and Wordsworth was 80; but these two poets were also philosophers, and spent much time in calm thought. Of the old philosophers, Zeno died at 98, Demosthenes at 99, Isocrates at 98, while Hippocrates, the father of medicine, lived to upwards of 100. Many medical men have lived to an advanced age, but it appears from statistics that physicians are, as a class, shorter-lived than members of other professions. Moses lived to the age of 120, and Joshua to that of 110, and their lives were lives of great activity. As an instance of hereditary longevity, may be mentioned that of Abraham, who lived to 175, Isaac to 180, Jacob to 147, and Joseph to 110. Some physiologists do not place reliance on records of longevity much beyond 100 years. Many instances, however, seem to be too well attested to admit of much doubt that individuals have lived to more than 140 years of age, and one of the cases given in some of the records which follow, that of Henry Jenkins, who is said to have lived to the age of 169, rests on evidence which many intelligent men do not feel justified in rejecting. The cases of the three Hungarians may be regarded as doubtful, but they are accepted by the author of the article "Age" in the *American Cyclopædia*, and they are given here, at all events, as interesting records. It must be admitted that there are no valid reasons for denying that life may be prolonged to the extent there claimed. Much of the evidence regarding the age to which individuals attain would, in most instances, be deemed insufficient in a court of law, and, if absolute proof be required, the collection of instances of great age would be small.

Buffon says that every animal lives six or seven times as long as the period of its growth, and Flourens remarks that this is very near the truth, he placing the relative terms of growth and perfected growth as 1 to 5. Both Buffon and Haller placed the normal term of life between 90 and 100 years. They afterwards, by the collection of instances, placed its extreme limit at a little less than two centuries, and Flourens adopts the idea that extraordinary extension of the term of life may go on to one-half more than the ordinary term. The late sir Henry Holland believed that there was sufficient proof of the frequent prolongation of human life to 110 and 140 years; but a recent writer, Mr. Thoms, maintains that any evidence that any human being ever attained the age, not of 140, but of 110 years, will be found upon examination to be untrustworthy, and there are others who to a certain extent share this opinion.

In a work called *The Code of Health and Longevity*, by sir John Sinclair (6th ed., Lond., 1844), and which contains much interesting matter, there is the following: "In a Dutch dictionary entitled *Het Algemeen Woonderbok*, there is an account of which the following is a translation. Petratsch (Peter) Czartan was born in 1537 at Kofrok, a village 4 m. from Temeswaer, in Hungary. When the Turks took Temeswaer from the Christians, he kept his father's cattle. A few days before his death he walked with the assistance of a stick to Kofrok. He had but little sight, and his beard was of a greenish white color, like moldy bread, and but few of his teeth remained. His son, 97 years of age, was born of his father's third wife. Being a Greek in religion, the old man was a strict observer of fasts, and never used any food but milk and cakes. He had descendants in the fifth generation, with whom he sometimes sported, carrying them in his arms. He died in 1724, at the age of 184 years. Count Wallis had a portrait taken of this old man when he fell in with him previous to his death. The Dutch envoy, then at Vienna, transmitted this account to the states-general." There is a picture of the old man in sir John's book, probably a copy

of the portrait of him which count Wallis had taken. The same book also contains portraits of an old married pair, also natives of Hungary. The following is a translation of the inscription on the picture: "John Rovin in the 173d year of his age, and Sarah, his wife, in the 164th year of her age. They have been married 147 years, and both born and died at Stadova, in the directory of Casanseber, in Temeswaer; their children, two sons and two daughters, are yet alive. The youngest son is 116 years of age, and has two great grandsons, the one in the 35th and the other in the 27th year of his age." Henry Jenkins, of Elberton, in Yorkshire, Eng., lived to the age of 169 years. At the age of between 10 and 12 he was sent to North Allerton with a horse load of arrows previous to the battle of Flodden, which was fought Sept. 9, 1513, and as he died Dec. 8, 1670, he must have been of the age reputed. "He had often been sworn in chancery and in the courts to above 140 years of memory." Sir John further remarks, "Little is known of his mode of life, excepting that towards the last century of it he was a fisherman, and not only used to wade the streams, but actually swam rivers after he was past the age of 100 years." Thomas Parr was born in the parish of Alherbury, in Shropshire, in 1483, in the reign of Edward IV., and died in London in 1635. "He lived in the reign of ten kings and queens, and was buried in Westminster abbey." He is said to have been a man of very different stamina from the rest of mankind, for a person who had seen him describes him thus: "From head to heel of his body he had, all over, a quick-set, thick-set, nat'ral hairy cover" (Sinclair). Sir John's book also contains portraits of the countess of Desmond, as well as of Jenkins and Parr. The countess of Desmond lived to the age of 140 years. Sir John says "she was a daughter of the Fitzgeralds of Drummond, in the county of Waterford, and in the reign of Edward IV. married James, 14th earl of Desmond." After his death, sir Walter Raleigh says, she held her jointure from all the earls of Desmond during her life. It is also said, on the authority of lord Bacon, that she twice renewed her teeth. In Bailey's *Records of Longevity* (Lond. 1747), there are, among others, the following records: "Thomas Hill, of Flitton, Staffordshire, died in 1601, aged 128. He was head steward to three successive earls of Kent. On the floor of the chancel, near the altar, is an effigy in brass of this patriarch. The rev. Mr. Braithwaite, of Carlisle, died in 1754, aged 110 years. He had been in the cathedral 102 years, having commenced as a singing boy in 1652, when eight years old." In a work entitled *Human Longevity*, by James Easton, published at Salisbury, Eng., in 1799, there are recorded the ages of 1712 persons who were said to have lived upwards of 100 years. Easton quotes a table from Hufeland, in which that author says that of 100 human beings who are born, 50 die before the 10th year, 20 between the 10th and 20th, 10 between the 20th and 30th, 6 between the 30th and 40th, 5 between the 40th and 50th, and 3 between the 50th and 60th, leaving only 6 to live above the 60th year. He says, "Haller, who collected the greatest number of instances respecting the age of man, found the relative duration of life to be in the following proportion: Of men who lived from 100 to 110 years, the instances have been 1000; from 110 to 120 there have been 60; from 120 to 130 there have been 29; from 130 to 140 there have been 15; from 140 to 150 there have been 6; and as high as 169, there has been 1 instance. But as this volume probably contains a much more extensive collection of long livers than any preceding work on the subject, I cannot deny myself the satisfaction of compiling from it the following table, similar to Haller's. Of males and females who lived from 100 to 110 years, both inclusive, the instances have been 1310; from 110 to 120 there have been 277; from 120 to 130 there have been 84; from 130 to 140 there have been 26; from 140 to 150 there have been 7; from 150 to 160 there have been 3; from 160 to 170 there have been 2; and from 170 to 185 there have been 3 instances = 1712." The following are among the names and ages mentioned by Easton: St. Patrick, 122; Attila, 124; Lywarch Hên, 150; St. Coemgene, commonly called St. Keiven, the founder, bishop, and abbot of Grandalock, or the seven churches in Wicklow, Ireland, 120; Piastus, king of Poland, 120; Lewis Cornaro, 104; St. Anthony the great, of Coma, in Egypt, 105; Jane Scrimshaw of the parish of Bow, 127; Alexander Stephens of Banffshire, 108; Donald Cameron of Kinnichlabar in Rannach, Scotland, 130, and who married at the age of 100; Mrs. Carter, of Waltham abbey, Essex, 101, who could walk five or six miles a day with ease till within a few months of her death; Dr. William Broughridge of Charles Street, Westminster, formerly one of the masters of the Charter house school, 112; Mrs. Keithe, of Newnham, Gloucestershire, "who lived moderately, and retained her senses till within fourteen days of her death, at 133 years, and who left three daughters, the eldest aged 111, the second 110, and the youngest 109; Peter McDonald lived to the age of 109 (his father died at 116, and his grandfather at 107 years); Thomas Winslow, aged 146, of the county of Tipperary, Ireland, a colonel in the army and had held the rank of captain in the reign of Charles I.; he also accompanied Oliver Cromwell into Ireland; Mr. Dobson, of Hatfield, a farmer, who by much exercise and temperate living prolonged his life to the age of 139 years: ninety-one children and grandchildren attended his funeral; Elanor Spicer, of Accomac, Virginia, lived to the age of 121 and worked at sewing till within six months of her death; Andrew Vidal, a native of Brazil, lived to the age of 124; he had 30 sons and 5 daughters, and in 1773 was living in the same house with his children and grandchildren, who numbered 149; John Weeks, of New London, Conn., died at the age of 114; married his tenth wife when he was 106 years old, she being only 16, it is said

that his hair and teeth were partially renewed." Easton also includes the names taken from Sinclair's book above mentioned. There died at Scottsville, Monroe county, N.Y., in the autumn of 1878, Mrs. Melissa Ganier, whose age is probably correctly given. She was married in 1789 at the age of 14, and removed in 1801 to the place where she died. She was, consequently, about 104 years old. Her husband survived her, at the age of 107. They had 95 descendants. At Norristown, Penn., Dec. 28, 1878, Mrs. Elizabeth Thomas died in her 102d year. At West Gloucester, Essex county, Mass., Oct. 26, 1878, Miss Mehitable Haskell died at the age of 89 years. She was the last of nine children who lived beyond fourscore years, one sister attaining the age of 96. The father, grandfather, great-grandfather and great-great-grandfather, all lived beyond 80 years. The influences affecting the longevity of men appear to have been so balanced that the average age of the human race has remained about the same for more than 4,000 years. But in this balancing process there is a depressing and life-shortening influence which necessarily reduces the natural average. It must, therefore, be concluded that a removal of all physically depressing and noxious influences would increase the longevity of the human race. The degenerating influences appear to exist in the cities, chiefly in consequence of the production of poisonous malaria and of infectious diseases, and if it were not for the constant regeneration of the population of cities by accessions from the country the age to which men usually live would be soon greatly shortened and there would be degeneration of race unless considerable reforms were made in sanitary affairs. The registrar-general of Great Britain in a recent report, in alluding to the sanitary condition of that country, says, "Within the shores of these islands 28,000,000 of people dwell who have not only supplied her (England's) armies and set her fleets in motion, but have manufactured innumerable products and are employed in the investigation of scientific truths and the creation of works of inestimable value to the human race. These people do not live out half their days. A hundred and forty thousand of them die every year unnatural deaths; two hundred and eighty thousand are constantly suffering from diseases which may be prevented. Their strength is impaired in a thousand ways; their affections and intellects are disturbed, deranged, and dimmed. Who will deliver the nation from these terrible enemies? Who will confer on the inhabitants of the United Kingdom the blessings of health and long life?" We will conclude this article with a condensed statement of the opinions of Dr. Benjamin Rush (q.v.), surgeon-general of the American army of the revolution, contained in his *Medical Inquiries and Observations*, several editions of which were published at the commencement of this century. He reviews the circumstances which favor longevity, the condition of body and mind which attends it, and the peculiar diseases of old age, and their remedies. The most important circumstance is descent from long-lived ancestors. He says, "I have not found a single instance of a person who has lived to be 80 years old in whom this was not the case. In some instances I have found the descent was only from one, but in general it was from both parents. Dr. Franklin, who died in his 84th year, was descended from long-lived parents. His father died at 89 and his mother at 87. His father had seventeen children by two wives." Intemperance in eating, Dr. Rush found in his experience, was even more prejudicial to longevity than intemperance in drinking, for he met only one man 84 years of age who had been intemperate in eating, but four or five who had been intemperate in the use of ardent spirits. He considers that literary pursuits are favorable to long life. "Business, politics, and religion, which are the objects of attention of men of all classes, impart a vigor to the understanding which by being conveyed to every part of the body tends to produce health and long life." In regard to the married state he met with only one person over 80 years of age who had never been married. He makes particular mention of a woman, a native of Herefordshire in England, who was in the 100th year of her age, and who had born a child at 60. She had suckled successive children at the same time. Dr. Rush remarked that immigrants from Europe often acquired fresh vigor from change of climate and occupation, and probably a prolongation of life. His observations did not indicate that acute or chronic diseases shortened life, and mentions the fact that "Dr. Franklin had two successive vomicas (cavities containing purulent matter) in his lungs before he was 40 years old." It is not improbable, however, that his lung difficulty did shorten his life. He met with one man 86 years old who had suffered all his life from syncope, but he met with but one person beyond the age of 80 who had ever had a disease of the stomach. Mr. John Strangeways Hutton, who died in Philadelphia, in the 109th year of his age, informed Dr. Rush that he had never vomited in his life. "He was born," says Dr. Rush, "in New York city in the year 1664. His grandfather lived to be 101, but was unable to walk for 30 years before he died, from excessive corpulence. His mother died at 91. He had a fixed dislike of ardent spirits of all kinds; his appetite was good, and he ate plentifully during the last years of his life, but rarely drinking between meals. He married twice, having eight children by his first, and seventeen by his second wife. He was about 5 ft. 9 in. in stature, slender, and carried an erect head to the last years of his life. He says, "I have not found the loss of teeth to affect the duration of life so much as might be expected. Edward Drinker, who lived to be 103 years old, lost his teeth thirty years before he died, from drawing the hot smoke of tobacco into his mouth through a short pipe." He makes the observation that "more women live to be old than men, but more men live to be *very* old than women. In regard to the characteristics of

the body and mind of old people he mentions their great sensitiveness to cold, and says, "I met with an old woman who slept continually under three blankets and a coverlet during the hottest summer months. The servant of prince de Beaufremont, who came from Mont Jura to Paris at the age of 121 to pay his respects to the first national assembly of France, shivered with cold in the middle of the dog-days when he was not near a good fire. The late Dr. Chovet, of this city (Philadelphia), who lived to be 85, slept in a baize night-gown under eight blankets and a coverlet, in a stove room many years before he died." He remarks that death from old age is the effect of a gradual palsy, showing itself first in the eyes and ears, then in other parts of the body, reaching the brain the last.

LONGFELLOW, HENRY WADSWORTH, an American poet, was b. at Portland, Me., on Feb. 27, 1807. At the age of 14 he entered Bowdoin college, Brunswick, and graduated there with high honors in 1825. For a short time he studied law in his father's office; but a professorship of modern languages having been founded in the Bowdoin college, and offered him, he accepted it, and proceeded to Europe to qualify himself for the discharge of his new duties. He returned to America in 1829. His first substantive work, *Outre Mer*, appeared in 1835; and in the same year he was appointed to the chair of modern languages and literature at Harvard university. He again spent a year in Europe, and made himself acquainted with the Danish and other northern literatures—an acquaintance which he has turned to noble account. In 1839 he published *Hyperion*, a prose romance, and *The Voices of the Night; Ballads and other Poems*, in 1841; *Poems on Slavery*, 1842; *The Spanish Student*, 1843; his *Poets and Poetry of Europe*, 1845; *Belfry of Bruges*, 1846; *Evangeline*, 1847; *Kavanagh*, 1849; *The Seaside and the Fireside*, 1850; *The Golden Legend*, 1851; *Hiawatha*, 1855; *Miles Standish*, 1858; *Tales of a Wayside Inn*, 1863; trans. of *Dante*, 1867; *Aftermath*, 1873; *The Hanging of the Crane*, 1874; *Pandora*, 1875; *Keramos*, 1878, etc. In 1869 he was made D.C.L. of Oxford.

Of the American poets, Longfellow is the most popular in England, and, at the same time, he is the most national. If his countrymen have not a national epic, *Evangeline* or *Hiawatha* is as yet the nearest approach to it. Some of his shorter lyrics are almost perfect in idea and expression. His poetry is deficient in force, but full of picturesqueness; and a certain quaintness of fancy is one of its most delightful attributes.

LONGFELLOW, HENRY WADSWORTH (*ante*), was the son of Stephen, an eminent lawyer of Portland, Me. While a student in Bowdoin college he wrote some of the best known of his earlier poems, among them the *Hymn of the Moravian Nuns;* the *Spirit of Poetry; Woods in Winter*, and *Sunrise on the Hills.* He held his professorship at Harvard 17 years, resigning in 1854, but continuing to reside at Cambridge, in the house occupied by Washington when the revolutionary army was encamped in that neighborhood. He spent the summer of 1842 at Boppard on the Rhine. In 1868–69 he revisited Europe, and was everywhere the recipient of high honors, especially in England, where his writings are exceedingly popular. Men of the highest literary and social distinction sought his acquaintance and were charmed by his dignified, kindly, and unassuming deportment. The general verdict upon his poetry is that, while it fails to represent the deepest passions of human nature, it is always kindled by the broadest sympathies, and marked by a delicate appreciation of all that is beautiful in nature and noble in humanity. Keenly sensitive to the imperfections and misdoings of men, he is never censorious, but always gentle and persuasive, appealing to the sympathies and motives which are common to people of every race, country, and clime. He exhibits the fruits of a broad culture, not in strained allusions to things beyond the reach of common readers, but in the clearness and simplicity with which he interprets to them the noblest thoughts of the noblest men of every age and country. Among his latest works are *Poems of Places*, selected from a great number of authors and filling 31 small volumes; and *Ultima Thule*, a volume of original poems.

LONGFELLOW, SAMUEL, b. Portland, Me., 1819; brother of Henry Wadsworth; graduated at Harvard college in 1839, and at the divinity school in 1846; from 1853 to 1860 was pastor of the Second Unitarian church in Brooklyn, resigning in order to go to Europe. After his return to America he resided many years at Cambridge, Mass., preaching frequently in Unitarian pulpits, but for most of the time devoted chiefly to literary pursuits. In 1878 he became pastor of the Unitarian church in Germantown, Penn., where he remains. He belongs to what is called the "left wing" of the Unitarian denomination, the section holding views most variant from the evangelical. In 1847, in association with the rev. Samuel Johnson and the rev. Samuel Osgood, he compiled *A Book of Hymns*, jocularly called the "Sam Book," but very highly esteemed both upon literary and religious grounds, and which was afterwards revised and published with the title of *Hymns of the Spirit.* In 1859 he published a book of *Hymns and Tunes for Congregational Use.* He has written a number of hymns marked by devoutness of feeling as well as a cultivated literary taste, and some of his fugitive poems are very highly esteemed. His published sermons and essays are remarkable for elevation of tone, for clearness of insight, and purity of style.

LONGFORD, an inland co. of the province of Leinster, Ireland, lying between Leitrim and Cavan on the n., Westmeath on the e. and s., and Roscommon on the w.; 29 m. long from n. to s., and 22 m. from e. to west. Its area is 269,409 acres, of which 191,823 are arable; population in 1871, 64,501. The surface is for the most part moist and flat,

with the exception of a slightly elevated central range, the greatest elevation of which is only 912 feet. Many small lakes pervade the county, and the river Shannon, or its nursing lakes, connect Longford with the county and city of Limerick. Its navigation is also connected with Dublin by the Royal canal, which traverses the county to the town of Longford, and terminates in the river Shannon at Clondra; and there are two branches of the Midland Great Western railway which pass through the county, from Mullingar to Longford and Cavan. The south of the county forms part of the central limestone district of Ireland. The north is a continuation of the clay-slate which prevails in Cavan, the two districts being separated by a belt of yellow sandstone and conglomerate, which projects from the east of Leitrim. Deep beds of marl are found in many of the boggy districts. Marble of good quality is also found, and ironstone, with coal, shale, and lead, of good quality, but not in remunerative quantity. The limestone district of the south is suited to tillage, and produces excellent wheat. The north is chiefly devoted to pasture. The number of acres under crop in 1876 was 72,859. In the same year, there were 59,933 cattle, 33,221 sheep, and 22,254 pigs. The chief towns are Longford (q.v.), Granard, and Ballymahon. Longford returns two members to parliament. The number of national schools, in 1871, was 132, attended by 7,305 pupils; in 1875 there were 14,060 pupils (13,232 being Catholics). Longford anciently formed part of the kingdom of Meath, and as such was included in Henry II.'s grant to Hugh de Lacy. It was erected into a county in 1564, but in the rebellion of 1641 it was recovered for a brief period by the O'Farrells, and, on the suppression of this rising, almost the entire county was distributed as confiscated lands to a new race of colonists. The antiquities are of much interest. The islands of Lough Ree are especially rich in monastic remains.

LONGFORD, capital of the above county, 75 m. w.n.w. from Dublin by the Midland Western railway, on a small river called the Camlin. It is a well-built town. The Roman Catholic cathedral, recently erected, is a very spacious, and, indeed, a magnificent building, of the Ionic order. Pop. '71, 4,375, of whom 3,473 were Roman Catholics, 645 Protestant Episcopalians, and the rest Protestants of other denominations. The chief commerce of Longford is in the agricultural produce of the district. No manufacture of any importance exists in the town. It is connected with Dublin and with Sligo by the Midland Western railway, as also with the former by the Royal canal.

LON'GHI, GIUSEPPE, 1766–1831; b. at Monza, near Milan; studied at the school of engraving there, became professor in 1798, and subsequently for several years the head of the institution. In 1801, by invitation of Bonaparte, he took part in the Cisalpine council at Lyons, going afterwards to Paris. His chief works are the "Vision of Ezekiel," after Raphael; the "Magdalen" of Correggio; the "Madonna del lago," after Leonardo da Vinci; and "Galatea," after Albano. He engraved many fine heads, among them those of Washington, Michael Angelo, and Napoleon. The plates known as the "Facti di Napoleone il Grande" are among his masterpieces. His latest biography was published by Baretta in 1837. Died at Milan.

LONGICOR'NES, a family of tetramerous coleoptera, containing a vast number of species, among which are many of the largest and most splendid beetles. They are remarkable for the length of their slender antennæ, which are often longer than the body. They all feed on vegetable food, some on leaves, some on roots, and are mostly inhabitants of forests; the females depositing their eggs, by means of a long, strong, horny ovipositor, beneath the bark of trees, on the wood of which the larvæ feed. The longicornes abound chiefly in warm countries, and particularly in South America; the number of British species, however, is considerable, but some of those so reckoned have probably been imported from foreign countries in the larva state, in timber, to which they often do great injury.

LONGI'NUS, DIONYSIUS CASSIUS, a Platonic philosopher and famous rhetorician, was b., according to some, at Emesa, in Syria, and according to others, at Athens, about 213 A.D. In his earlier years, he traveled a great deal in the company of his parents, and made the acquaintance of many celebrated scholars and philosophers. He studied Greek literature at Alexandria, where he was for a considerable time the pupil of Ammonius and Origen, and subsequently settled as a teacher of rhetoric in Athens, where he soon acquired a great reputation. His knowledge was immense: he was called a "living library" and a "walking museum," but his taste and critical acuteness were no less wonderful. He was probably the best critic of all antiquity. In an age when Platonism was giving place to the semi-oriental mysticism and dreams of Neoplatonism, Longinus stands out conspicuous as a genuine disciple of the great master. Clear, calm, rational, yet lofty, he despised the fantastic speculations of Plotinus, who consequently would not admit that Longinus was a philosopher, but—since he stooped to criticise the diction and style of Plato—pronounced him a mere philologist. In the latter years of his life, he accepted the invitation of Zenobia to undertake the education of her children at Palmyra; but becoming also her prime political adviser, he was beheaded as a traitor, by command of the emperor Aurelian, 273 A.D. Longinus was a heathen, but a generous and tolerant heathen. Of his works, the only one extant (and even that one only in part) is a treatise, *Peri Hypsous* (On the Sublime). There are many editions of Longi-

nus's treatise, of which those by Morus (Leip. 1769), Toupius (Oxf. 1778, 2d ed. 1789, 3d ed. 1806), Weiske (Leip. 1809), and Egger (Paris, 1837), are among the best. See also Ruhnken's *Dissertatio de Vita et Scriptis Longini.*

LONGIPEN'NES, in Cuvier's ornithological system, that section of the order *palmipedes* characterized by long wings and great power of flight. The wings are often very narrow. They are all sea-birds, and many of them venture to a great distance from shore. Their hind-toe is small and free, or wanting. They cannot dive and pursue their prey under water, but they swim well, and their movements in the air are very graceful. Petrels, shearwaters, gulls, terns, noddies, skimmers, and albatrosses are examples.

LONGIROS'TRES, a tribe of birds of the order *grallæ*, having generally a long, slender, feeble bill, and inhabiting sea-shores and marshy places, where they seek worms and other food in the mud or ooze. To this tribe belong snipes, woodcocks, curlews, godwits, sandpipers, etc.

LONG ISLAND, an island which forms three counties of the state of New York, between lat. 40° 33′ to 41° 6′ n. and long. 72° to 74° 2′ w., bounded n. by Long Island sound, e. and s. by the Atlantic ocean, and w. by the bay and harbor of New York. It is 115 m. long, and 12 m. in average width, with an area of 1682 sq. miles. On its s. shore is a bay 100 m. long, and from 2 to 5 m. wide, separated from the ocean by a narrow beach of sand, with several inlets. On this shore are several lighthouses, and 30 life-boat stations. A line of hills runs along the northern portion of the island, but the center is a plain, sloping to the sea. Villages, watering-places, and fertile farms line the coasts, but the interior is mostly waste land and forest. The principal towns are Brooklyn (opposite New York), Flushing, Jamaica. The shores are lined with watering-places for summer resort. This island was once inhabited by 13 Indian tribes. Aug. 22, 1776, sir Henry Clinton landed on Long Island with 9,000 British troops, defeated gen. Putnam, and compelled Washington to evacuate the island. Pop. '70, 540,648

LONG ISLAND (*ante*), an island belonging to the state of New York, embracing the three counties of Kings, Queens, and Suffolk. It lies between 40° 34′ and 41° 10′ n. lat., and between 71° 51′ and 74° 4′ w. longitude. It is bounded s. and e. by the Atlantic ocean, n. by Long Island sound, and w. by the bay of New York and the East river. Its length is about 125 m., its average width 14 m.; area, 927,900 acres; pop. '80, 744,022. The coast is indented with many bays and inlets, abounding with shell and other fish. One of these is Peconic bay, 30 m. long, which divides the eastern end of the island into two parts or projections, the one on the n. side terminating at Oyster Pond point, that on the s. terminating at Montauk point, 20 m. farther east. On the s. side of the island is a bay nearly 100 m. long and from 2 to 5 m. broad, formed by the Great South beach, a strip of white sand from one-fourth of a mile to a mile in width, with occasional openings to the ocean. Near the western end of the island are Jamaica, Hempstead, Oyster, and Huntington bays. Shelter, Gardiner's, Fisher's and Plumb islands, in the adjacent waters, are attached politically to Long Island. The coasts, bordering as they do on the track of an immense ocean commerce, are furnished not only with a large number of lighthouses, but with life-saving stations, provided with every means of rendering aid to vessels in distress. The surface, though presenting considerable variety, is marked by no great elevations. A range of hills extends, with frequent interruptions, from the northern boundary of New Utrecht in the w. almost to the eastern extremity of the island on the n. side of Peconic bay. These hills are considerably nearer to the northern than to the southern margin of the island. North of them the surface is uneven and rough, while on the s. it has a gradual inclination toward the sea, and is broken here and there by wide sandy plains producing only coarse grass and stunted shrubs. Some of these plains, by the application of manures, have of late years been brought under cultivation. A considerable portion of the island is in forest, from which wild game has not yet been wholly exterminated. There are numerous springs and small streams, and many ponds, some of them quite large, while swamps and marshes abound. The largest stream is the Peconic, which, after a course of 15 m., empties into the bay of the same name. It furnishes numerous mill seats. Of salt marsh the island is computed to contain more than 100 sq.m. With the exception of the sandy plains above mentioned the soil is for the most part fertile, in some sections peculiarly rich. Much of it is in a high state of cultivation, being devoted to the production of vegetables for the Brooklyn and New York markets. This is especially true of the two westernmost counties, Kings and Queens. The climate, on account of the influence of the sea, is milder and more equable than the same latitude in the interior, the mercury seldom falling below zero or rising above 90°, the average temperature being about 51°. The highest elevations on the island are Hempstead Harbor hill at Roslyn, and West hill in Suffolk co., both which are 384 ft. above the sea. On the s. side, Coney island, Rockaway, Quogue, Babylon, Fire island, Southampton, Easthampton, and Montauk point are watering-places, several of which are much frequented in the hot season. Coney island especially, which is but a few miles from New York and Brooklyn, and easily accessible by boat or rail, has within a few years become a place of resort for vast multitudes of people, for whose accommodation immense hotels have

been erected. The Long Island railroad passes through nearly the entire length of the island, from Hunter's Point at the western to Greenport near the eastern extremity, and connects by branches with various places at a greater or less distance from its main track; while there are numerous other and shorter roads, connecting many towns with Brooklyn and New York. Among these are the North Shore, Southern, Flushing and Central, Flushing and North Side, Smithtown and Port Jefferson, New York and Rockaway, Newtown and Flushing, Bay Ridge, Hempstead and Jerusalem, Brooklyn and Jamaica, Brooklyn and Coney Island, etc. Steamboats also ply regularly between New York and the principal towns on the n. side.

The principal cities and towns on the island are Brooklyn, Long Island City, Garden City, Flatbush, New Lots, Flushing, Hempstead, Jamaica, Oyster Bay, North Hempstead, Huntington, Brookhaven, Riverhead, Southampton, and Southold. Brooklyn, at the extreme western extremity of the island, is the third city of the United States in population. It is connected with different parts of New York by eight or ten ferries, and will soon be connected therewith by a magnificent wire suspension bridge, crossing at such a height that only the largest vessels will have to lower their topmost-masts in passing under it. Garden City was founded by the late Alexander T. Stewart, a wealthy merchant of New York, on land formerly known as Hempstead plains, which, since the first discovery of the island had been regarded as almost worthless. Mr. Stewart purchased a tract of 12,000 acres, on a portion of which Garden City has been built, while other portions have been brought under successful cultivation. The city is as yet in an inchoate state; though it contains many fine buildings and a considerable population. One of the objects of the founder was to furnish economical and healthful homes for families of small means, whose heads might be employed in New York. An immense and costly cathedral, for the uses of the Protestant Episcopal church, is nearly completed.

Long island when first discovered was the abode of 13 tribes of Indians, of which the only remnants are some 200 Shinnecooks, a mixed breed of Indians and negroes in Southampton, and a few families of Montauks. The island was included in the grant made to the Plymouth colony by James I. in 1620. In 1625 the first settlement was made by some French Protestants under Dutch protection. In 1636 the Dutch made several settlements at the western end, near New York, but the larger portion of the island, and especially its eastern section, was settled by colonists from Connecticut and other parts of New England. The island was called "Lange Islandt" by the Dutch; in 1693 the English changed it by law to the "island of Nassau"—a name, however, which never came into popular use. In 1636 Jaques Bentyn and Adrianse Bennet purchased of the Indians 930 acres of land within the present boundaries of the city of Brooklyn. Mr. Bennet erected here the first house ever built upon the island, and which was burned by the Indians in 1643. In the troubles which preceded the revolution the people of Long Island were intensely patriotic, but the reverses of the American arms which placed the island in the power of the British during the war made it impossible for them to do much for the cause of independence. One of the earliest battles of the war was fought in Brooklyn, Aug. 26–28, 1776, when the Americans occupying the defensive under gen. Putnam were overcome by a greatly superior British force and compelled to retreat in boats across the East river under cover of a thick fog. The patriotic portion of the inhabitants, left thus under British control, endured many privations and not a little persecution during the whole period of the war.

LONG ISLAND CITY, a city in Queens co., N. Y., at the n.w. extremity of Long Island; formed from a portion of the town of Newtown, and incorporated in 1870; pop. '74 about 16,000. It extends 3 m. e. and w., and 5 m. n. and s., and has a water front of 10 m. along Newtown creek, which separates it from Brooklyn, and thence n. along East river to Bowery bay. It is divided into five wards and has 3 post-offices, viz.: Astoria, Ravenswood, and Long Island City. The s.w. portion is called Hunter's Point, this being the w. terminus of the Long Island, Flushing, and other railroads. The n. portion is the most elevated, and in Astoria and Ravenswood are many fine residences and beautiful drives. The streets and avenues are wide, and provision is made for three public parks. Hunter's Point is connected with New York city by 2 ferries, Astoria by one and by the Harlem boats. Several lines of horse-railroad connect the city with Brooklyn. Hunter's Point is a great depot for the storage and shipment of petroleum. It contains extensive lumber-yards, several oil refineries, granite works, a marine railway, and manufactures of chemicals, cabinet-ware, hammers, boilers, refrigerators, steam-engines, asbestos roofing, mattresses, etc. Astoria has manufactures of pianofortes, carpets, carriages, jewelry, etc. The city has 14 churches, a fine court-house, excellent school-buildings, and 1 daily and 5 weekly newspapers. The courts of the county of Queens are held here, though the various county offices remain at Jamaica, the former capital.

LONG ISLAND SOUND, a body of water between Long Island and New York and Connecticut, 110 m. long, and from 2 to 20 m. wide, commencing narrow at New York city, which it separates from Brooklyn, and where it is called East river, and opening at its eastern extremity into the Atlantic ocean, by a passage called "the Race." It is navigated by an immense number of coasting-vessels and steamers, and is strongly forti-

fied at Throggs point, near New York. It receives the Connecticut, Housatonic, Thames, and Mystic rivers on its northern shore.

LONG ISLAND SOUND (*ante*), an arm of the Atlantic ocean, lying between New York and Connecticut on the n. and Long Island on the s.; about 110 m. in length and from 2 to 25 m. in breadth. Its depth is generally about 70 ft., scarcely anywhere exceeding 120 ft. It is connected with the ocean on the e. by a passage called the Race, and on the w. by the East river, New York bay, and the Narrows. It has many harbors moderately good, and one or two excellent. The Connecticut shore is rocky and reefs impede navigation for a distance from the land: the Long Island shore is less broken. The principal rivers flowing into the sound are the Housatonic, Connecticut, and Thames. The sound is the route of an extensive commerce between New York and the principal cities and towns of New England, and is navigated by many lines of steamers and sailing vessels. The narrow and rock-bound strait called "Hell-gate," at the western extremity of the sound, has made this route practically unavailable hitherto for vessels approaching New York from the ocean, but measures are in progress for widening the channel by the removal of the rocks, and, when this work is fully accomplished, a new and highly advantageous channel for ocean commerce will be opened.

LONGITUDE. See LATITUDE.

LONG LAKE, one of the series of Adirondack lakes, situated in the n.e. part of Hamilton co.; 18 m. in length, and about 3 m. wide. It is remarkable for the beauty of the surrounding scenery, having Buck mountain on the right and the Blueberry mountains on the left, as one enters by way of the Raquette river. From this point a fine view is obtained of Mt. Seward, 4,348 ft. in height, from which the lake is distant 10 miles. The lake itself is at an elevation 1575 ft. above the level of the sea. Its position and its length make it an important part of the interesting and extensive line of travel through successive lakes and streams in the Adirondack region.

LONGLAND, ROBERT. See LANGLANDE.

LONGLEY, CHARLES THOMAS, D.D., 1794–1868; b. in Westmeathshire, England; educated at Westminster school and Christ-church college, Oxford, where he ranked as first-class scholar in classics. After his graduation he continued some time at the university as college tutor, censor, and public examiner. He became perpetual curate of Cowley in 1823; rector of West Tytherly, 1827; head-master of Harrow school, 1829; bishop of Ripon, 1836; of Durham, 1856; archbishop of York, 1860; and of Canterbury, 1862. In this last position, as primate of all England, he continued until his death. The year before he died he presided at the sessions of the Pan-Anglican synod, composed of all the bishops of the church of England and of the churches in communion with it. By some persons archbishop Longley has been described as deficient in firmness and other positive elements of character required especially in his most exalted position, which he held at a difficult time. In person he was amiable, dignified, courteous, and devout. Before his death he referred to words which had been used by bishop Hooker, expressive of his sense of guilt and of his reliance on the blood of Christ to cleanse him from sin, as containing the faith in which he wished to die.

LONGMAN, THOMAS, 1699–1755; b. England; having served an apprenticeship to John Osborne, a bookseller of London, was taken into partnership by him in 1725, in Paternoster row, establishing a business which has since been continued by his successors, on the same site under various firm names—now Longmans, Green, Reader, & Dyer. The style of the firm at one time was Messrs. Longman, Brown, Green, Hurst, Rees, Orme & Longmans. In 1728 he was concerned in publishing, by subscription, the *Cyclopædia* of Ephraim Chambers in 2 large folio volumes, a second edition appearing in less than 10 years, and 5 editions in 18 years. It is, with one exception (the *Lexicon Technicum* of John Harris, 1706–10), the first English encyclopædia or general dictionary of the arts and sciences, subdivided under suitable heads and alphabetically arranged. It subsequently formed the basis of *Rees's Cyclopædia*, 4 vols., 1781–86. He was one of six booksellers who undertook in 1747 to publish a dictionary of the English language in 2 folio vols., and employed Samuel Johnson to perform the work for the sum of 1500 guineas, out of which he paid his assistants. The dictionary was issued complete in 1755, but has been so altered by editors as scarcely to be recognized, in its present guise, as Johnson's.

LONGMAN, THOMAS, 1731–97; b. England; nephew of Thomas (1699–1755), was received into the publishing company of his uncle in 1754, and was the pioneer among exporters of books to America. In 1776 he began to publish a new edition of *Chambers's Cyclopædia*, completed in 1786, 4 vols. folio, edited by Abraham Rees, who became one of the firm, and with whom he was associated in publishing *Rees's Cyclopædia*, 1802–19, in 45 vols.

LONGMAN, THOMAS NORTON, 1770–1842; b. England; for 50 years the head of the publishing firm of Longman & Co. of Paternoster row, London, son of Thomas (1731–97), and grandnephew of the original publisher of that name. In 1792 he became a partner with his father in publishing and selling books, adding greatly to the influence and efficiency of the house as long as his connection with it lasted; admitting various partners during his long career as business manager. In the early years of the 19th c.

they held the copyright of Lindley Murray's *English Grammar*, and brought out the first efforts of Coleridge, Southey, Wordsworth, and others of the lake poets. Prior to 1811 they were Thomas Moore's publishers, with the exception of his life of lord Byron. Scott's *Lay of the Last Minstrel*, and some of the *Waverley* novels were published by them; also the works of Macaulay, Herschel, etc. In 1826 they assisted in publishing the *Edinburgh Review*, and issued 133 vols. of Lardner's *Cabinet Cyclopædia*, 1829–46. He left the business to his sons Thomas and William, under the style of Longmans, Green, Reader & Dyer, who have sustained the distinguished character of the firm.—WILLIAM (d. 1877) was the author of *The History of the Life and Times of Edward III.; Lectures on the History of England, from the Earliest Times to the Death of King Edward II.;* and in 1856 his *Journal of Six Weeks' Adventure in Switzerland, Piedmont, and on the Italian Lakes*, was printed for private circulation. William also wrote a number of articles on entomology, attaining some distinction in that branch of study.

LONGOBARDS. See LOMBARDS and LOMBARDY, *ante.*

LONG PARLIAMENT, the name given to the parliament of England summoned by Charles I. for the purpose of granting him supplies wherewith to carry on his war against his rebellious subjects. It assembled Nov. 3, 1640, and remained in session 12 years, 5 months, and 17 days, when it was dissolved by Oliver Cromwell, April 20, 1653. This parliament impeached and executed the earl of Strafford, abolished the star chamber, and provided against its own dissolution except by its own consent. Finally it drove out of the house of commons those members who remained faithful to the king, dismissed the house of lords, and established a high court of justice, before which the king was brought to trial and sentenced to death, being beheaded on the scaffold Jan. 30, 1649. When Cromwell expelled the remains of the long parliament, he set up another assembly, of nominated members, but in the tumultuous state of public feeling, neither this nor any other of his parliamentary experiments worked satisfactorily.

LONGSTREET, AUGUSTUS BALDWIN, LL.D., 1799–1870; b. Augusta, Ga.; graduated at Yale in 1813; studied law at the celebrated school in Litchfield, Conn., and was admitted to the bar in Richmond co., Ga., in 1815; began his legal practice in Greensborough, Ga., and soon rose to eminence in his profession. In 1821 he was a member of the legislature, and in 1822 made judge of the court in the Ocmulgee circuit, but soon resigned his judicial honors, continued the practice of the law at Augusta, and established there the *Sentinel* newspaper, which in 1838 was consolidated with the *Chronicle*. In 1838 he abandoned the legal profession to become a clergyman, united himself with the Methodist conference of Georgia, and was at once assigned to a pastorate in Augusta. In 1839 he was elected president of Emory college, Oxford, Ga., holding the position until 1848, when he was made president of Centenary college, La., but was soon afterwards transferred to the university of Mississippi at Oxford. He was a member of the general conference held in the city of New York in 1844, and took a conspicuous part in the debates upon the case of bishop Andrew (involving the question of slavery), which ended in a rupture of the M. E. church into the northern and southern bodies. He was an active politician of the state rights democratic school, and a supporter of slavery. Among his writings may be mentioned *Letters from Georgia to Massachusetts; Letters to Clergymen of the Northern Methodist Church;* and *A Review of the Decision of the Supreme Court of the United States in the Case of McCulloch v. The State of Maryland.* His literary writings were of a humorous character, and among these were *Georgia Scenes* and *Master William Mitten, or the Youth of Brilliant Talents who was Ruined by Bad Luck.* Died at Oxford, Miss.

LONGSTREET, JAMES, b. S. C., 1820; appointed to the military academy from Alabama, and after his graduation in 1842 stationed at various points on the Texan frontier until the breaking out of the Mexican war, in which he served with distinction, and was brevetted successively captain and major for gallantry at Churubusco and Molino del Rey. After the war he continued to serve in Texas, becoming paymaster with the rank of major in 1858. On the outbreak of the rebellion he threw up his commission, and entered the confederate service. He commanded the 4th brigade of Beauregard's 1st corps, participating in the first battle of Bull Run. Promoted to a major-generalship in 1862, he distinguished himself in the campaigns under Lee against Pope, McClellan, Burnside, and Meade. After the battle of Fredericksburg, Dec. 13, 1862, he was made a lieutenant-general. He led the confederate right at Gettysburg, and being sent by Lee to the relief of Bragg, carried the day at Chickamauga, Sept. 19, 20, 1862. In Nov. of the same year he drove Burnside into Knoxville, to which he laid siege; but he was compelled to withdraw after the federal victory at Chattanooga, and join Lee in Virginia. He took a distinguished part in the operations in the Wilderness, till severely wounded, May 6, 1864, but recovered in time to resume command of his corps during the siege of Petersburg. At the close of the war, whose results he was one of the first southerners to accept, he devoted himself to the development of the southern railroad system. Afterwards separating himself from the majority of his former associates, he accepted office under a republican administration, becoming in 1869 surveyor of the port of New Orleans. In 1875 he removed to Georgia, and in 1880 was sent to Turkey as U. S. minister.

LONGSTREET, WILLIAM, 1760–1814; b. N. J. Removing to Georgia, he conceived, as soon as, or before Fulton, the idea of propelling boats by steam, and in 1790 applied to the governor of Georgia for means to carry out his plan. His application was refused, but some time afterwards he succeeded in building a small boat, which went up the Savannah river at a speed of 5 m. an hour. He was also the inventor of the "breast-roller" improvement of the cotton-gin, working by horse-power. He built two of these to run by steam at Augusta, but they were burned, as were the steam mills which he subsequently built at St. Mary's.

LONG'TON, a t. of Staffordshire, England, in the district of the Potteries. Longton was incorporated as a municipal borough in 1865. It is about 2 m. s.e. from Stoke, on a small stream, which falls into the Trent, and is on the line of the North Staffordshire railway. Part of the town is known as LANE-END. The growth of the town has been rapid, and is entirely due to the manufacture of china and earthenware, in which the inhabitants are chiefly employed. Pop. '61, 16,690; '71, 19,748.

LONGUEVILLE, ANNE GÉNEVIÈVE DE BOURBON-CONDÉ, Duchesse de, 1619–79; b. in the donjon of Vincennes, where her father, Henry III. of Bourbon, was a prisoner. Her mother was Charlotte de Montmorency, sister of the great Condé. Before arriving at womanhood her beauty and grace, and a singularly sympathetic attraction, made her *début* at the court a social event. She was at once a pupil and a star in the choice society gathered around the marquise de Rambouillet. In 1642, at the age of 23, she became wife of the duc de Longueville, an old *roué*, who deserved and received no love from his young wife. She was strongly attached to Coligny, who was killed in a duel by the duc de Guise. In 1646, her husband being ambassador at Munster, the duchess was already so renowned for her charms that her reception was like an ovation to a monarch; but she speedily tired of the vulgar show, and returned to the more elegant and refined circles of Paris. The duc de Rochefoucauld, author of the *Maximes*, became her ardent admirer and favorite. Up to this time she had exhibited only the power to charm the most eminent men by a singular blending of languor and sweetness of manner. The internal troubles of France generated a strong animosity between the French parliament and cardinal Mazarin, regent of Louis XIV., and developed into a civil war, called the war of the Fronde. The duchess participated in the popular hatred of Mazarin and espoused the other side. From this time she appears in a *rôle* which exhibits energy, powers of intrigue, and ability of a high order. La Rochefoucauld's ascendency over her heart and her mind awakened her to political ambition. She became the soul and bond of alliance between the various friends of the parliament, and supported the acts of the citizens of Paris, who rose against Mazarin and by barricades forced his flight from the city. With the duchesse de Bouillon installed in the Hotel de Ville, she aided to keep Paris in the possession of the insurrectionists against the regent. During this time she gave birth to a child, alleged to be a son of La Rochefoucauld. She was an active party to the treaty of peace with Mazarin in 1649. Soon after, her husband was imprisoned in Vincennes, and she flew to Normandy to effect a rising of the people against Mazarin, but failed. She then sought safety for herself and fled to Holland, and thence to the great general, Turenne, at Stenau, and soon acquired an ascendency over him which for a time made him untrue to his government, and in the end led to the submission of the duchess to Mazarin and her return to Paris. For a short time she returned to the literary and social frivolities of the Hotel Rambouillet; but her uncle Condé and prince Conti, her brother, having again broken with the Mazarin government, she joined them at Bourges and Bordeaux, where the democratic character of the supporters of their cause was like bitter water to her taste. Her party fell apart; her brother Conti and La Rochefoucauld made their separate peace with the government; Condé fled to Spain; and the duchess returned to Paris, pardoned through the efforts of her husband in her behalf. She immediately after went into retirement from society and politics, but was soon required by her husband to join him in Normandy, where he was governor. Seeking to avoid publicity, as she then was, Mazarin was still suspicious of her, and in a conversation with the Spanish ambassador, who plead the cause of her brother Condé, he said: "You Spaniards can talk at your ease; your women only trouble themselves with affairs of love; but in France it is quite another thing, for we have three who are quite capable to govern or to overturn three kingdoms—the duchesse de Longueville, the princess Palatine, and the duchesse de Chevreuse." The death of her husband in 1663 only induced her to greater seclusion, and, though she lived in Paris, her presence was only felt in her occasional mediation to ameliorate the condition of the Protestants, and to avert the hostility of the Catholic power towards them. Her son, born in 1649, had opened a brilliant career, and had even been called to the throne of Poland, when she had news of his death in battle, June, 1672. She retired to the convent of the Carmelites, but continued the friend of the Jansenists; and when their persecution was renewed, it was under her roof that "the grand Arnoult" was successfully hid. For 25 years after this, Mme. de Longueville lived in tranquillity, rendering as obscure as possible the beauty which never left her, and performing the gracious acts of kindness which her life, in the midst of the *religieuses*, gave opportunity to do. M. Victor Cousin has written the *Memoires de Madame de Longueville*, in 3 vols., with a care that gives it one of the highest places in French biography.

LON'GUS, a Greek sophist of the 4th or 5th c. of the Christian era, author of a novel, *Daphnis and Chloe*, which was translated into English by G. Thornley, London, 1657, and of which an edition appeared in Leipsic as late as 1835.

LONG VACATION, a period of the year in England when suits cannot be carried on, but are for some purposes suspended—viz., from Aug. 10 to Oct. 24 at common law, and to Oct. 28 in chancery in every year. Hence it is called the lawyer's holiday.

LONGVIEW, a t. in Gregg co., Texas, on the Sabine river, at the junction of the Texas and Pacific with the International and Great Northern railroad; 66 m. w. of Shreveport, La. Pop. 2,000. It has 4 churches, 1 banking-house, and a number of schools, and is a shipping-point of some importance. Cotton is the staple product of the region, and there are in the immediate vicinity over 40 saw-mills. Incorporated as a village in 1871.

LONGWORTH, NICHOLAS, 1782–1863; b. N. J.; removed to Cincinnati, where he was admitted to the bar, and practiced for a quarter of a century, when he retired, devoting himself to vine culture, in which he had become interested as early as 1828. He succeeded in producing excellent varieties of native wine. He had early invested largely in Cincinnati real estate; the rise in the value of which caused a large part of the great fortune, estimated at $15,000,000, which he left at his death.

LONGWY, a t. in the n. of the department of Moselle, France, near the left bank of the Chiers, a tributary of the Meuse; on a railway 40 m. n.w. of Metz, and a mile from the Belgian frontier; pop. 4,197. It consists of an upper and lower town. The former is on a hill, where anciently stood a strong castle, which was destroyed and replaced in the time of Louis XIV. by a town. This is fortified, well built, has a town-hall, churches, a hospital, a military prison, and several deep wells which supply it with water. The lower town has manufactures of calico, delft-ware, porcelain, table-covers, lace, and leather. Longwy was founded in the 7th century. It has sustained many sieges. In 1792 it was taken by the Prussians under the duke of Brunswick; in 1815 by the allies under the prince of Hesse-Homburg, after a vigorous resistance. Longwy was called by Louis XIV. *The Iron Gate of France.*

LONI'GO, a t. of the Italian states, in the province of Vicenza, situated in a valley 12 m. s.w. of the city of that name. It is protected by three strong towers, the antiquity of which is attested by the inscription they bear. The inhabitants, 6,786 in number, are chiefly devoted to agriculture and commercial industry.

LÖNN'ROT, ELIAS, b. Finland, 1802; at first followed his father's trade of a tailor, and was for a time apprentice to a druggist, but subsequently studied medicine, receiving the degree of M.D. in 1832. He practiced for a time, but in 1853 became professor of Finnish at the university of Helsingfors. In 1835 he published a collection of the popular songs of East Finland, under the name of *Kalevala*, and in 1842 a collection of popular proverbs.

LONOKÉ, a co. in e. central Arkansas, formed in 1870 from portions of Prairie and Pulaski counties, and bounded n. by Cypress bayou. It is traversed by the St. Louis, Iron Mountain and Southern, and the Memphis and Little Rock railroads. The soil is fertile; much of the surface is in forest. Pop. '80, 12,147. Capital, Lonoké.

LONS-LE-SAUNIER, a t. of eastern France, in the department of the Jura, at the confluence of the Seille, Vallière, and Solman, about 55 m. s.e. of Dijon. It is situated in a beautiful valley, surrounded by vine-clad hills, and was founded as long ago as the 4th c., when its salt springs were discovered, from which 20,000 quintals of salt are yearly extracted. Pop. '76, 11,265. Rouget de Lisle, the composer of the *Marseillaise*, was born here.

LOO-CHOO, or LIU-TCHIU, the native name of a group of islands called by the Chinese Liéu-kiéu, and by the Japanese Riu-kiu. These islands, about 90 in number, lie in the Pacific ocean, about 400 m. off the coast of China, lat. 24° to 29° n., long. 127° to 129° east. The largest and most southern, called Great Lu-tchu, or Okinawa, is about 65 m. long and 13 broad. Its shores have a beautiful appearance; fields and forests are clothed with a living green, pine-woods crown the summits of the hills, and gardens and cornfields adorn their slopes. In loveliness and variety of landscape, as in the careful attention paid to agriculture, especially in the southern part of Great Lu-tchu, which looks like one vast enchanting garden, few places anywhere could surpass these islands. The principal products of the group are rice, millet, sugar, cotton, tobacco, indigo, and tea; of less importance, bananas, pine-apples, oranges, peaches, and plums. Domestic animals are very numerous—ducks, geese, swine, goats, cattle, and horses. The chief minerals are iron, coal, and sulphur, probably also copper and tin. Sugar, and a liquor called *saki*, distilled from rice, are exported to Japan. The manufacturing industry of the inhabitants is as great as the agricultural. They make paper, cloths, coarse linens, earthen and lacquered wares, bricks, tobacco-pipes, and baskets.

The people are partly Japanese and partly an aboriginal tribe closely allied to the Japanese stock, although the literature and customs of the islanders are Chinese. The population was in 1872 estimated to amount to 166,789. Their religion is chiefly a mixture of the doctrines and practices of Confucius with those of Buddha. The govern-

ment, as in China, appears to be in the hands of an aristocracy of learned men, and the king is said to be related to the imperial family of Japan. The islands (with an area of 2,658 sq.m.) are tributary to Japan. In 1851 a Christian mission was founded by Dr. Bettelheim, a German physician, who has introduced vaccination.

LOODIA'NA, a district of British India, one of the three districts into which the division of Ambala, or Umballa, in the Punjab is divided. It lies in the 77th degree of e. long., extending in n. lat. from 30° 34′ to 31° 2′; and, with an area of 1359 sq.m., it contained in 1868 a population of 583,245 souls—an average of nearly 428 persons to the sq. mile.

LOODIA'NA, the capital of a district of the same name in British India, takes its name from the Lodi tribe of Afghans, and is situated 1,102 m. n.w. of Calcutta, in lat. 30° 55′ n., and long. 75° 54′ east. It stands on a navigable nullah or stream, which joins the Sutlej from the e., about 15 m. below the town. Pop. '68, 39,983, mostly weavers. The principal manufactures are cotton-cloth and Cashmere shawls, the latter, however, being inferior in quality to those made in Cashmere itself. Loodiana is a military station of some importance. Over the Sutlej a bridge was opened in Oct., 1870, to connect the Delhi and Lahore railways.

LOOF, the after-part of a ship's bow, or that portion where the planks incurvate towards the cut-water. The guns mounted in this portion of the vessel are styled "loof-pieces."

LOOKING-GLASS. See MIRROR.

LOOM, the machine by which weaving is effected. The art of weaving is coeval with civilization, therefore the loom may be reckoned amongst the earliest of man's inventions; yet notwithstanding its vast age very little improvement was effected in it until the invention of Dr. Cartwright in 1787, who, without ever having seen a loom in his life before, constructed one to work by machine-power. In its simplest form, the loom is worked by hand, and notwithstanding the wonderful improvements which have been effected in the power-loom since its invention, there are still many fabrics manufactured by hand-looms in this and other countries.

In India, which most probably is the native country of the loom, and where silks of almost unrivaled beauty are made, the natives continue to use this machine in its most primitive form; two trees growing near together form their standing frame, and a few pieces of bamboo, together with some pieces of string, furnish all they want besides.

As the use of the loom will be fully explained in the article WEAVING, the construction only will be given here; but it is necessary, in order to make this clear, to explain the principle of weaving, in order to show the work the loom has to do. In its simplest sense, weaving consists in passing one set of threads traverseiy through another set, divided into two series, working alternately up and down, so as to receive the transverse threads in passing, and interlock them, forming thereby a united surface out of the threads. The loom is made to assist the weaver in this operation, and is of no other use than to hold the working parts in their proper position. The native of India supplies this usually by selecting, as before stated, two near-growing tree-stems, usually palms, in consequence of their straightness; these, with four stakes to support his warp, and two or three pegs to fix his heald-ropes, complete his arrangements.

At each end of the frame, two rollers are placed, so that they will readily turn on their axes; and from one to the other, the threads of the warp are attached, and kept tight by weights. The warp-threads are wound round one roller, which is called the *beam* or *yarn-roll*, only as much of each thread being left unwound as will reach to the other roller, which is the *cloth-beam*, to which the ends are fastened, and upon which the cloth is wound as it is woven.

The next step is to divide the warp-thread into two equal sets by raising up every alternate one, and inserting between them a smooth rod of wood, to prevent them entangling or returning to their former position. This separation takes place before the final fixing of the ends of the threads to the *cloth-beam*, because, previous to that, each thread must be passed through a small loop in a perpendicular thread called the heald, which hangs down from a rod. There are always two sets of healds in the simplest form of loom, often many more; and in the case of plain weaving, the threads of the warp are divided alternately by the loops of each heald, so that if one heald is raised, it lifts every alternate thread of the warp, and if the other is depressed, it pulls down the opposite set of threads; the united action of the two healds opens a space between the two sets of warp-threads. This space is called the shed, and through it is thrown the shuttle which carries the thread of the weft; when the weft has passed through, the healds are reversed, and the lower warp-threads now become the upper ones. The threads, after each intersection, are driven up tight by the reed, which is a narrow frame with transverse wires set sufficiently far apart for a single thread of warp to pass through each; it hangs to the frame called the batten. The movement of the batten is produced by the hand of the weaver, whilst that of the healds is readily effected by the treadles.

Many improvements have been made in this the simplest form of loom, but the chief has been in replacing the weaver's hand in the necessary operation of throwing the shut-

tle by a mechanical arrangement. Without this, the *power-loom* would not have succeeded. The shuttle is usually made of box or some other hard wood, and the blunt points are covered with iron. Formerly, when used entirely by the hand, it was made much lighter and smaller than at present. Those now in use are about a foot in length, and rather more than an inch square in the middle. The middle part is hollowed out into a small box, open on the upper side. In this box the bobbin, on which the yarn or thread is wound, is placed, with its two ends on pivots, admitting of its being turned by the slightest strain on the yarn; the end of the yarn passes through a hole in the side of the shuttle, and as it is thrown backwards and forwards, the thread unwinds from the inclosed bobbin, and easily runs through the hole.

In the improved looms for power, and even in those still worked by hand, in special cases the arrangement for projecting the shuttle backward and forward is very simple. On each side of the loom, exactly in a line with the *shed*, is a groove of about 18 in., in which the shuttle lies free; and there is a very simple arrangement by which a piece of leather and a strap are made to act like a sling on each side; and the grooves or *shuttle-races*, as they are called, guide the movement with such precision that the shuttle is sent flying through the shed from side to side with unerring exactness. Great simplicity and compactness has now been attained in the power-loom, three of which can stand in the space occupied by one of the cumbrous machines formerly in use. There are few machines in use which have had more mechanical ingenuity displayed in their improvement than the loom; but as it is not the object of this article to do more than give the general principles upon which the machine works, the reader is referred for fuller information to the thick volume of the *Abstract of Patents* for weaving published by the patent commissioners.

LOOMIS, ELIAS, LL.D., b. in Connecticut in 1811, educated at Yale college, graduating in 1830; was tutor there for three years, 1833–36; spent the next year in scientific investigation in Paris, where he made a careful study of astronomy, meteorology, and higher mathematics; on his return was appointed professor of natural philosophy in the Western Reserve college, Ohio; from 1844 to 1860 held similar positions in Columbia college and the University of New York, and in the latter year returned to New Haven, where he has since resided, holding the professorship of natural philosophy formerly occupied by prof. Olmsted, in Yale, and pursuing his investigations in scientific and mathematical branches. He has published—besides many papers in the *American Journal of Science*, memoirs of his researches, in the *Transactions of the American Philosophical Society*, and other miscellaneous writings—a very complete set of text-books on mathematics, including treatises on arithmetic, algebra, elements of geometry and conic sections, analytical geometry and calculus, plane and spherical trigonometry, and tables of logarithms; also, a treatise on astronomy and one on meteorology. All of these are in constant use in schools and colleges throughout the country, and are marked by the accuracy and precision which are characteristic of the author personally. He has also published a book of family genealogy, *The Descendants of Joseph Loomis* (1870). Both as an instructor and writer, prof. Loomis is remarkable for his clearness and directness in expression, and his contributions to the cause of education have not been confined to formulating truths already known, as he has made many important scientific discoveries and advanced many new theories.

LOOMIS, GUSTAVUS, 1789–1872; b. at Thetford, Vt.; graduated from the U. S. military academy in 1811; entered the army as 2d lieut. of artillerists, and, after doing garrison duty in the harbor of New York for two years, was ordered to the Niagara frontier; assisted in the capture of fort Dodge, May 27, 1813, and was made prisoner at fort Niagara in the following Dec. After the war with Great Britain he served in various capacities in different parts of the country, especially in Texas and Florida, and on the western frontier against hostile Indians; was made col. of the 5th infantry in 1851; during the first years of the rebellion he was employed in court-martial and recruiting duty and as a mustering officer; retired from active service in 1863; made brig.gen. by brevet in 1865. Died at Stratford, Conn.

LOON. See DIVER.

LOOPHOLES, in fortification, are small apertures in the walls, through which sharpshooters may fire. The loophole should widen towards the outside, that the shooter may have a sweep with his rifle; and it is of importance, on that account, so to fashion the sides that a bullet may not penetrate, unless fired straight into the center. For this purpose, the stones are generally laid stepwise, although other forms are frequently resorted to.

LOPE DE VEGA. See VEGA.

LO'PES, or LOPEZ, FERNÃO, b. Portugal about 1380; the oldest of the Portuguese chroniclers; was appointed chief archivist of the kingdom by Dom Joao I., and devoted his life to the collection of materials for the history of his country. He wrote a work, *Chronica del Rey Dom Joao I.*, describing the great struggle between Portugal and Castile towards the close of the 14th c., which, as a picture of manners, has been compared with that of Froissart for accurate and dramatic reality. His other works are *Chronica do Senhor Rei Dom Pedro I.; Chronica do Senhor Rei Dom Fernando*, both

printed in vol. iv. of the *Collecçao de Livros Meditos de Historia Portugueza*. These works are regarded by eminent scholars as of great literary and critical value.

LO'PEZ, CARLOS ANTONIO, 1790–1862; b. Paraguay. After studying civil and canon law at the ecclesiastical seminary in Assuncion, he lived for a number of years in seclusion to avoid the hostility of Dr. Francia, then dictator of Paraguay. Upon Francia's death in 1840 he returned to the capital, and acted as secretary to the military junta which had become the *de facto* government of Paraguay. In 1841 he was elected consul, with a colleague; from 1844 till his death he held the office of president, to which the congress had elected him for a term of ten years from 1844, of three years from 1854, and of seven years from 1857, with power in the latter case to name his successor by will. During his administration he began the organization of an army and navy, opened Paraguay to foreign emigration and commerce, made commercial treaties with foreign powers, built a railroad, and sent many Paraguayans to Europe to be educated. His arbitrariness and hostility to foreigners gave rise to many diplomatic difficulties between Paraguay and foreign states; and England, France, the United States, and Brazil came very near declaring war against him. But his administration, on the whole, was a period of internal tranquillity and material prosperity to Paraguay, and at his death he was able to bequeath his power to his son, Francisco Solano Lopez.

LO'PEZ, FRANCISCO SOLANO, 1827–70; b. Paraguay; educated abroad, and in 1845 appointed commander-in-chief of the Paraguayan army. In 1854 he was sent to Europe on a diplomatic mission, and negotiated treaties with England, France, and Sardinia. In Europe he made the acquaintance of a Mrs. Lynch, the Irish wife of a French officer. Lopez took her to Paraguay with him, and made her his mistress. She was a woman of considerable talent and force of character, and exercised a great influence over Lopez. He at once took the office of minister of war, and began to prepare secretly for a forcible annexation to Paraguay of parts of Brazil, the Argentine Republic, and Bolivia. In 1862 he succeeded his father in the presidency, and in 1864, under the pretense of protecting the "equilibrium" of the Plata river, he called on Brazil to withdraw her troops from Uruguay, where a civil war was in progress, in which Brazil had intervened. Upon the refusal of Brazil, he took possession of the Brazilian province of Matto Grosso. In 1865 he invaded the Brazilian province of Rio Grande do Sul, sending 8,000 troops through the territory of the Argentine Republic for that purpose, and, upon that government protesting, he declared war against it. Congress now conferred upon him extraordinary powers, and he invaded the Argentine Republic before the declaration of war had reached Buenos Ayres. Brazil, Uruguay, and the Argentine Republic entered into an alliance against him, and in 1866 invaded Paraguay. The war continued four years, Lopez recruiting his forces by a conscription of all persons between the ages of 12 and 70. In 1868 the Brazilian fleet bombarded Assuncion, and the same year Lopez arrested and put to the torture many of the civil officers of the government and the foreign diplomatic corps on a charge of conspiracy. A number were executed, and the lives of some of the members of the American mission were saved only by the timely arrival of an American squadron. Finally, Mar. 1, 1870, Lopez, who had gradually been driven into the n. of Paraguay, was overtaken by the Brazilian cavalry at the Aquidaban river, and, while trying to swim across, was killed. His last words were, "I die for my country." His eldest son was also killed; his mistress, Mrs. Lynch, was spared, and returned to England. The remnant of his forces immediately surrendered.

LO'PEZ, NARCISO, 1799–1851; b. Venezuela. After serving in the Spanish army, in which he attained the rank of col., he removed to Cuba upon the evacuation of Venezuela by the Spanish troops, and became a liberal leader. He was in Spain during the first Carlist insurrection; and sided with the royalists, receiving office from the crown. In 1849 he came to this country to organize an expedition against Cuba, where he landed in 1851, but was soon taken prisoner and put to death.

LOPHIADÆ. See ANGLER.

LOPHI'ODON, an extinct genus of ungulate mammals, belonging to the family *tapiridæ*, of which the genus *tapirus* is the only surviving member. Their remains are found in the eocene tertiary formation of central Europe. Some 15 species of lophiodon are known. They much resembled the tapirs, but possessed distinctive dental characteristics, the formula being: *i.*, $\frac{3-3}{3-3}$; *c.*, $\frac{1-1}{1-1}$; *pm.*, $\frac{3-3}{3-3}$; *m.*, $\frac{3-3}{3-3} = 40$,—the tapir having *i.*, $\frac{3-3}{3-3}$; *c.*, $\frac{1-1}{1-1}$; *pm.*, $\frac{4-4}{3-3}$; *m.*, $\frac{3-3}{3-3} = 42$, or two more molars than in lophiodon. The limbs of the animal are still unknown. The genus has not been satisfactorily identified in America, but the species, which abounded in Europe during the eocene, varied in size from that of a rabbit to a rhinoceros. Other genera of tapiridæ are *hyracotherium*, *pachynolophus*, *pliolophus*, *lophiotherium*, and *propalæotherium*, found in European eocene. In North America the nearest allies of lophiodon are *helates* and *hyrachius*. The latter genus has four premolars in the upper jaw, resembling the true tapirs. The premolars resemble those of lophiodon in being less complex than the molars. In the North American miocene the tapiridæ belong to the genus *tapiravus*. See PERISSODACTYLA; TAPIR; UNGULATA.

LOPHOBRAN'CHII, an order of osseous fishes, having the ultimate divisions of the gills not pectinated, but arranged in small tufts in pairs along the branchial arches. There is nothing like this in any other fishes. The fishes of this order are few, mostly of small size, angular form, and peculiar aspect. See HIPPOCAMPUS and PIPE-FISH. The gill-cover is large, and the gill-opening is a small hole. The snout is elongated and tubular.

LOQUAT, *Eriobotrya Japonica*, an esteemed Chinese and Japanese fruit, of the natural order *rosaceæ*, sub-order *roseæ*, and of a genus closely allied to *mespilus* (Medlar). It has been introduced into Australia, and is now abundant there, and is sold in large quantities, and at a cheap rate, in the markets of Sydney and other towns. The tree or shrub which produces it attains a height of 20 or 30 ft., but in cultivation is seldom allowed to exceed 12 feet. It is a beautiful evergreen, with large oblong wrinkled leaves, and white flowers in terminal woolly panicles, having a fragrance like that of hawthorn-blossom; the fruit is downy, oval, or pear-shaped, yellow, and about the size of a large gooseberry. The seeds have an agreeable flavor, which they impart to tarts. The loquat lives in the open air in the s. of England, and produces fruit; but a warmer climate is required for fruit of fine quality. It is not unfrequent in hot-houses. It may be grafted on any species of *mespilus*.—The species of *eriobotrya* are all evergreen. The CUILA (*E. elliptica*) is a native of Nepaul, and produces an eatable fruit.

LORAIN', a n. co. of Ohio, bounded n. by lake Erie; traversed by the Lake Shore and Michigan Southern, the Lake Shore and Tuscarawas Valley, the Cleveland and Toledo, and the Cleveland, Columbus and Cincinnati railroads; pop. 30,308. It has a fertile soil, and the chief productions are live stock, grain, fruit, wool, hay, butter, and cheese. There are manufactures of cheese, lumber, clothing, carriages, furniture, harness, metallic ware, etc. Capital, Elyria.

LORANTHA'CEÆ. See MISTLETOE.

LORCA (ancient *Eliocroca*), a t. of Spain, province of Murcia, 40 m. s.w. of the city of that name, on the right bank of the Sangonera, is picturesquely situated on an eminence crowned by a fortified castle commanding a magnificent view. Next to Murcia, Lorca, is the most flourishing town in the province, possessing substantial houses, 8 churches, 9 monasteries, many oil and flour mills, saltpeter and powder works, lead-mines, and manufactures of cotton, etc. Pop. 31,000.

LORD (Saxon *hlaford*, from *hlaf*, loaf, and *ord*, a beginning or cause—i.e., the originator or supplier of food), a title given in Great Britain to persons noble by birth or by creation. Peers of the realm are so styled, including such archbishops or bishops as are members of the house of lords, who are lords spiritual. By courtesy, the title lord is given to the eldest sons of dukes, marquises, and earls, prefixed to an inferior title of the peerage, and to the younger sons of dukes and marquises, prefixed to their Christian name and surname. The following persons bear the title lord in virtue of their employments: the lord-lieutenant of Ireland and lords-lieutenant of counties (see LIEUTENANT, LORD), the lord chancellor (see CHANCELLOR), lord privy seal (see PRIVY SEAL), lords of the treasury (see TREASURY) and of the admiralty (see ADMIRAL), the lord high admiral, lord great chamberlain, and lord chamberlain (see CHAMBERLAIN, LORD), lord high constable (see CONSTABLE), lord high almoner (see ALMONER), lord high steward (see STEWARD), lord steward of the household, lords in waiting, lords of the bedchamber (see BEDCHAMBER, LORDS OF THE), lords justices (see JUSTICES, LORDS), the lord chief baron of exchequer (q.v.), the lord chief justice (see JUSTICE, LORD CHIEF), the lord lyon (see LYON KING AT ARMS), the lord mayor of London, York, and Dublin (see MAYORS), and the lords provost of Edinburgh and Glasgow (see PROVOST). The committee of the Scottish parliament by whom the laws to be proposed were prepared, were called lords of the articles. The favored beneficiaries, who, after the Scottish reformation, obtained in temporal lordship the benefices formerly held by bishops and abbots, were called lords of erection. Persons to whom rights of regality were granted in Scotland (see REGALITY), were termed lords of regality. The representative of the sovereign in the general assembly of the church of Scotland (see ASSEMBLY, GENERAL) is called the lord high commissioner. The judges of the courts of session and justiciary in Scotland have the title "lord" prefixed to their surname or some territorial designation assumed by them; and throughout the three kingdoms, judges are addressed "my lord" when presiding in court.

LORD, ELEAZAR, LL.D., 1788–1871; b. Franklin, Conn., and educated at Andover, Mass.; removed in 1809 to New York, where in 1812 he entered the ministry of the Presbyterian church. He was among the founders of the American education society for assisting poor young men in their preparations for the Christian ministry, the New York Sunday-school union, and various other benevolent associations; was corresponding secretary of the New York Sunday-school union 1818–26, and president 1826–36. In 1818 he left the ministry to engage in banking; founded the Manhattan insurance company, and served as its president 1821–34; was the first president of the Erie railroad company; removed in 1836 to Piermont, N. Y.; was a prominent friend of the New York university, and assisted in founding theological seminaries at East Windsor, Conn., and Auburn, N. Y. His principal works are *Principles of Currency; Geology and Scrip-*

tural Cosmogony; and an edition of Lemprière's *Biographical Dictionary*, with numerous additions. Died at Piermont.

LORD, JOHN, LL.D., b. at Portsmouth, N. H., 1810; graduated at Dartmouth college in 1833; was for some time an agent of the American peace society, and subsequently a preacher in New Marlboro', Mass., and Utica, N. Y. A few years later he left the pulpit to devote himself to historical research and popular lecturing. Beginning his new career in England and Scotland, he returned to the United States in 1846, since which time he has been engaged with great success in lecturing upon historical subjects in the principal cities and towns of this country. Destitute of the special gifts and graces of an orator, he yet crowds his lectures with information and delivers them in a manner so peculiar as to command the unflagging interest of his audiences.

LORD, NATHAN, D.D., LL.D., 1793–1870; b. in South Berwick, Me.; graduated at Bowdoin college 1809, and at Andover theological seminary 1815; was pastor of a Congregational church at Amherst, N. H., 1816–28, and president of Dartmouth college, 1828–63. After the formation of the American antislavery society in 1833 he was for a time an abolitionist and even elected as an officer of that society, but later changed his position, avowing his belief that "slavery is an institution of God according to natural religion," and "a positive institution of revealed religion." Although his opinions on this subject were very distasteful to the friends of the college in general, yet, on account of his many estimable personal qualities, he was for a long time undisturbed in his place at the head of the institution. Died at Hanover, N. H.

LORD ADVOCATE OF SCOTLAND. See ADVOCATE.

LORD OF THE MANOR, the owner of a manor having copyhold tenants. See MANOR.

LORD ORDINARY. See COURT OF SESSION.

LORD'S DAY, in point of law, has been made the subject of several statutes. The chief statute in England is the *Lord's-day act*, 29 Ch. II. c. 7, which enacted that no tradesman, artificer, workman, or laborer should exercise the worldly labor, business, or work of his ordinary calling upon the Lord's day (works of necessity and charity only excepted), nor any person should publicly cry, or expose to sale, wares, fruits, herbs, etc.; but nothing in the act was to extend to prohibiting the dressing of meat in families or inns, cook-shops, or victualing-houses, nor the selling of milk within certain hours. To these exceptions, selling mackerel and baking bread were added subsequently. These statutes have been construed strictly by the courts on the ground that they restrain the liberty of the subject, for, without a statute, ordinary work would be as competent on the Sunday as on any other day. Hence, unless a case comes within the strict letter of the statute, there is no disability. Thus, a horse may be sold on Sunday by one who is not a horse-dealer, for then it is not part of the seller's ordinary calling. So a farmer may hire a servant on that day; indeed, the statute does not apply to farmers, attorneys, surgeons, and those not included in the above statutory description, and therefore those parties can do their work on Sunday as on other days. Irrespective of any statute, it has been the immemorial course of practice in courts of law not to do legal business on Sunday, and not to recognize the service of writs, warrants, etc., of a civil nature, if made on Sunday. Thus, no debtor can be arrested for debt on Sunday, and hence he may walk at large that day, free from molestation of bailiffs. But if any crime has been committed, the party can be arrested on Sunday as well as other days. There is a special provision by statute as to ale-houses, beer-houses, and refreshment-houses being open on Sundays, the general effect of which is only to close these places during church hours. If any game is pursued on Sunday, whether by poachers or not, a penalty is incurred. There is also a statute of 1 Ch. I. prohibiting sports or pastimes of certain descriptions. Except as above-mentioned, there is no difference made as to the validity of acts done on Sunday, though it is an erroneous popular impression that deeds or wills, bills of exchange, etc., dated or executed on Sunday are invalid.

In Scotland, the law varies in some respects from that of England on this matter. There also contracts made on Sunday are not null at common law, but numerous statutes have passed prohibiting contracts, whether made in the course of one's ordinary business or not, and whether made by workmen, artificers, etc., or not. But there is an exception of works of necessity and mercy. It is, however, doubtful how far these old statutes are in desuetude or not, and judges have said that they only apply to public, not private acts done on Sunday. In Scotland, the rule is acted on that the enforcement of decrees and warrants, poindings, and other process or diligence in civil matters, are void; but it is otherwise in criminal matters. It is singular that there is no distinct penalty imposed in Scotland, as there is in England and Ireland, by the game acts, on persons sporting on Sunday. But Scotland outstrips England and Ireland in the stringency with which public-houses are prohibited from being open on that day. See PUBLIC-HOUSES.

LORD'S DAY, THE (*ante*), the first day of the week, on which Christ rose from the dead; synonymous in popular speech with Sunday or Sabbath. This name is generally used in the English and American statutes intended to secure the civil observance of the day. English legislation on this subject may be traced as far back as 1449, but it

was not until 1678 that the law was passed which may be regarded as the foundation and model of all subsequent enactments of its class in Great Britain and the United States. By this law it was enacted "that no tradesman, artificer, workman, laborer, or other person whatsoever, shall do or exercise any worldly labor, business, or work of their ordinary callings upon the Lord's day or any part thereof (works of necessity and charity only excepted);" and "that no person or persons whatsoever shall publicly cry, show forth, or expose to sale, any wares, merchandise, fruits, herbs, goods, or chattels whatsoever, upon the Lord's day or any part thereof." In the American colonial days the state assumed jurisdiction of religious as well as civil affairs; hence much of the Sunday legislation of that period has either been repealed or become dead from disuse. It is now generally conceded that with the Lord's day, regarded simply in its religious aspects, the state has no concern. It cannot require a citizen either to attend public worship or to observe any religious ceremony on that day. But it is held that the day is indispensable, needed by the community, upon purely secular grounds, and must, therefore, be maintained by government. A day of rest from ordinary labors and cares, recurring not less frequently than once in each week, is held to be requisite to the general welfare of body, mind, and estate; therefore, it is insisted that the government has the right and the duty to designate such a day and to enforce its observance. Moreover, those who observe the day upon religious grounds, making it a day of public as well as private devotion, are, it is conceded, entitled to protection from the noise and disturbance which would result from the general pursuit of business on that as on other days of the week. The laws upon this subject in the different states of the union, though resting substantially upon common ground, differ in details, and the decisions of courts upon questions that have arisen under them are in some respects conflicting. The whole subject has been greatly complicated of late years by the introduction into the country of large bodies of immigrants from continental Europe, whose habits in respect of Sunday observance are much less rigid than those of the great body of our native population. It is probable that, on this account, the laws upon the subject may undergo some further modifications, but there is no reason to fear that the state will cease to maintain the institution of the Lord's day as a day of rest from business cares, or to protect from disturbance those who hold it sacred on the highest grounds of morality and religion. The manifest tendency to increase greatly the facilities of travel by railroad and steamboat on the Lord's day is causing alarm of late, and awakening earnest protest. It is felt—religion aside—that this country cannot afford, either morally, physiologically, or pecuniarily, to lose its one day of peace. Though the protest against the degradation of the day bases itself thus on secular considerations, and finds immense strength in these, it will probably be found that the real force of all successful efforts for the maintenance of the day, on even civil grounds, must spring ultimately from a religious—a distinctively Christian—source.

LORDS, HOUSE OF. See PARLIAMENT.

LORD'S-SUPPER, THE, is one of the sacraments of the Christian religion (see SACRAMENT). It is so called from its being instituted at supper by Jesus Christ, whom his disciples styled the Lord or Master. It receives also the names of eucharist and communion (q.v.). With the exception of the Quakers, all sects of Christians, however different their views as to its nature, agree in celebrating it as one of the most sacred rites of religion. The present article is written from the point of view of those who admit more or less the idea of a historical development of the doctrines connected with the Lord's-supper; the views of Roman Catholics, who hold that the doctrines of their church on the subject were delivered by our Lord and his apostles, and have from the first centuries been taught in substance in the church, will be found under other heads. See MASS; TRANSUBSTANTIATION.

The circumstances of sorrow amid which it was instituted, and its intimate relation to the crowning work of Jesus, his death, had, at the very outset, made a deep impression upon the early church. Not only was the solemnity, in conformity with its original institution, repeated daily in conjunction with the so-called *Agapæ* (q. v.) (love-feasts), and retained as a separate rite when these feasts were set aside; but from the very first it was believed to possess a peculiar efficacy, and soon ideas of the wonderful and mystical became associated with it. The Lord's-supper was celebrated on every important occasion of life—when entering on marriage, when commemorating departed friends and martyrs, etc.; to those that could not be present at the meeting of the congregation, such as prisoners, sick persons, and children, the indispensable food of heaven was carried by the deacons, and in some churches—those of Africa, for instance—the communicants took part of the materials of the feast home with them, that they might welcome the gift of a new day with consecrated food. Heathens also and unworthy persons were excluded from this holy mystery. As early as the 2d c., Ignatius, Justin Martyr, and Irenæus advance the opinion that the mere bread and wine became, in the eucharist, something higher—the earthly, something heavenly—without, however, ceasing to be bread and wine. Though these views were opposed by some eminent individual Christian teachers, such as Origen (died 254), who took a figurative conception of the sacrament, and depreciated its efficacy; yet both among the people and in the ritual of the church, more particularly after the 4th c., the miraculous or supernatural view of

the Lord's-supper gained ground. After the 3d c., the office of presenting the bread and wine came to be confined to the ministers or priests. This practice arose from, and in turn strengthened the notion which was gaining ground, that in this act of presentation by the priest, a sacrifice, similar to that once offered up in the death of Christ, though bloodless, was ever anew presented to God. This still deepened the feeling of mysterious significance and importance with which the rite of the Lord's-supper was viewed, and led to that gradually increasing splendor of celebration which, under Gregory the great (590), took the form of the mass. See MASS. As in Christ two distinct natures, the divine and the human, were wonderfully combined, so in the eucharist there was a corresponding union of the earthly and the heavenly.

For a long time there was no formal declaration of the mind of the church on the presence of Christ in the eucharist. At length, in the first half of the 9th c., a discussion on the point was raised by the abbot of Corvei, Paschasius Radbertus, and Ratramnus, a learned monk of the same convent; they exchanged several violent controversial writings, *De Sanguine et Corpore Domini*, and the most distinguished men of the time took part in the discussion. Paschasius maintained that the bread and wine are, in the act of consecration, transformed by the omnipotence of God into that very body of Christ which was once born of Mary, nailed to the cross, and raised from the dead. According to this conception, nothing remains of the bread and wine but the outward form, the taste, and the smell; while Ratramnus would only allow that there is some change in the bread and wine themselves, but granted that an actual transformation of their power and efficacy takes place. The greater accordance of the first view with the credulity of the age, its love of the wonderful and magical, as well as with the natural desire for the utmost possible nearness to Christ, in order to be unfailingly saved by him, the interest of the priesthood to add luster to a rite which enhanced their own office, and the apparently logical character of the inference, that where the power, according to universal admission, was changed, there must be a change also of the substance; the result of all these concurring influences was, that when the views of Ratramnus were in substance revived by Berengarius, canon of Tours, in opposition to Lanfranc, bishop of Canterbury, and cardinal Humbert, the doctrine of transubstantiation, as it came to be called, triumphed, and was officially approved by the council of Rome in 1079. In the fourth Lateran council at Rome, 1215, under Innocent III., transubstantiation was declared to be an article of faith; and it has continued to be so held by the Roman Catholic church to the present day. The Greek Catholic church sanctioned the same view of transubstantiation at the synod of Jerusalem in 1672.

The reformation of the 16th c. again raised the question on the nature of the eucharist. The Lutheran church rejected from the first the Catholic doctrine of transubstantiation, as well as of the mass, i. e., the constant renewal of the sacrifice of Christ, and merely taught that, through the power of God, and in a way not to be explained, the body and blood of Christ are present in, with, and under the unchanged bread and wine. In opposition to this doctrine, it was laid down by Zwingli, that the Lord's-supper is a mere commemoration of the death of Christ, and a profession of belonging to his church, the bread and wine being only symbols: a view which is adopted in substance by the Socinians, Arminians, and German Catholics. Luther bitterly opposed the symbolical view, especially towards the latter part of his career; Zwingli's doctrine was more repugnant to him than the deeper and more mystic Catholic doctrine. See IMPANATION.

Calvin sought to strike a middle course, which has been substantially followed by the reformed churches. According to him, the body of Christ is not actually present in the bread and wine, which he also holds to be mere symbols. But the "faithful" receiver is, at the moment of partaking, brought into union with Christ, through the medium of the holy Spirit, and receives of that heavenly power (efficacy) which is always emanating from his glorified body in heaven. Melanchthon, in this controversy, was inclined to the views of Calvin; but he thought a union might be effected by adopting the declaration that Christ in the eucharist is "truly and really" present (not merely in faith). The endeavors of Melanchthon and his party, by arbitrary alterations of the Augsburg confession, and other means, to effect a public reconciliation, only served to rouse among the partisans of Luther a furious theological storm, and the result was the establishment of the peculiar views of Luther, and the final separation of the Lutheran and reformed churches.

The whole controversy relates to the *mode* in which the body and blood of Christ are present in the Lord's-supper; for it was agreed on all hands that they are present in some way. The reformed theologians argued that *presence* is a relative term, opposed not to distance, but to absence; and that presence, in this case, does not mean local nearness, but presence in efficacy. Here they parted company both with the Roman Catholic church and with the Lutherans. They were willing to call this presence "real" ("if they want words," as Zwingli said), meaning true and efficacious, but they would not admit corporal or essential presence. But while the reformed churches were at one in holding that, by receiving the body and blood of Christ, is meant, receiving their virtue and efficacy, there is some difference in their way of expressing what that efficacy is. Some said it was their efficacy as broken and shed—i.e., their sacrificial efficacy; others, in addition to this, speak of a mysterious supernatural efficacy flowing from the glorified body of Christ

With regard to the reformed churches, it may be remarked that their confessions on this point were mostly formed for the express purpose of compromise, to avoid a breach with the Lutherans. Hence the language of these confessions contains more of the mystical element than the framers of them seem, in other parts of their writings, to favor. And it is remarkable that the Anglican confessions, which were framed under different circumstances, lean more to the symbolical view of Zwingli than those of any other of the reformed churches. The thirty-nine articles, after laying down that "to such as with faith receive the same, it is a partaking of the body of Christ," repudiate the notion of transubstantiation; and add: "The body of Christ is given, taken, and eaten in the supper only after an heavenly and spiritual manner. And the mean whereby the body of Christ is received and eaten in the supper is faith."

The Presbyterian church of Scotland adopted substantially the views of Calvin. The words of the Westminster confession are: "That doctrine which maintains a change of the substance of bread and wine into the substance of Christ's body and blood (commonly called transubstantiation) by consecration of a priest, or by any other way, is repugnant not to Scripture alone, but even to common sense and reason. . . . Worthy receivers, outwardly partaking of the visible elements in this sacrament, do then also inwardly by faith, really and indeed, yet not carnally and corporally, but spiritually, receive and feed upon Christ crucified, and all benefits of his death: the body and blood of Christ being then not corporally or carnally in, with, or under the bread and wine: yet as really, but spiritually, present to the faith of believers in that ordinance, as the elements themselves are to their outward senses."

This variety of dogmatical opinion as to the eucharist naturally gave rise to variety in the ceremonials of its observance. The Catholic notion of a mysterious transformation, produced the dread of allowing any of the bread and wine to drop, and led to the substitution of wafers (*hostiæ oblatæ*) for the breaking of bread. The doctrine of the "real union," which declares that in the bread as well as in the wine, in each singly and and by itself, Christ entire is present and tasted—a doctrine which was attested by wafers visibly bleeding—caused the cup to be gradually withdrawn from the laity and non-officiating priests; this practice was first authoritatively sanctioned at the council of Constance, 1415. All the reformed churches restored the cup: in the Greek church it had never been given. From the same feeling of deep reverence for the eucharist, the communion of children gradually came, after the 12th c., to be discontinued. The Greek church alone admits the practice. Grounded on the doctrine of transubstantiation, the Greek and Roman Catholic churches hold the "elevation of the host" (*hostia*, victim or sacrifice) to be a symbol of the exaltation of Christ from the state of humiliation; connected with this is the "adoration of the host," and the carrying it about in solemn procession. The use of leavened bread in the Greek church, and of unleavened in the Roman Catholic and Lutheran, of water mixed with wine in the Roman Catholic and Greek churches, and of unmixed wine in the Protestant churches, are trifling differences, mostly owing their origin to accidental circumstances; yet once magnified into importance by symbolical explanations, they have given occasion to the hottest controversies. The greater part of the reformed churches agree in breaking the bread and letting the communicants take it with the hand (not with the mouth); and this practice is owing to the original tendency of those churches to the symbolical conception of the eucharist, in which the breaking of the bread and the pouring out of the wine are essential elements.

Although the great divisions of the Christian world have continued as churches to adhere to those doctrines about the Lord's-supper which were fixed and stereotyped in acts of council and articles and confessions about the time of the reformation, we are not to suppose that the opinions of individuals within those churches continue equally uniform and fixed. Even Roman Catholic theologians, like Bossuet, have sometimes endeavored to understand the doctrine of the church in a philosophical sense; and in the Lutheran church, the greatest variety of opinion prevails. Some uphold unmodified the dogmas of Luther; others accept them with explanation; Hegel even undertook to ground them on speculative reason. Others, as Schleiermacher, would have recourse to the views of Calvin as a means of reconciliation with the reformed churches. Even all "supernatural" theologians do not adhere strictly to the formulas of the church; while rationalism in all its phases tends to the pure symbolism of Zwingli.

The Anglican church is divided on this, as on several kindred topics, into two parties: with one, the symbolical view of the rite is predominant; the other party reprobate this view as "low," and maintain an *objective* "mystical presence" of the thing signified, along with the sign. Notwithstanding the "higher" doctrine of the Scotch confession, the tendency in Scotland seems to be more the other way; from the pulpit, the rite is oftener spoken of in its commemorative character, and the signs as means of working upon the mind and feelings subjectively than as the vehicle of any objective, mystically operating grace.

LORELEI. See LURLEI, *ante*.

LORENCEZ, CHARLES FERDINAND LATRILLE, Comte de, b. France, 1814; educated in the French military school of St. Cyr and attached to the army of Africa and the Crimea, he distinguished himself at the capture of the Malakoff and was made gen-

eral of brigade; was put in command of the French expeditionary corps in 1862 for the subjugation of Mexico, where he participated in several victories and defeats of the French armies. After the appointment of gen. Forey to the command of the French in Mexico he returned to France, and was a devoted adherent of Louis Napoleon.

LO'RENZ, OTTOKAR, b. Iglau, Moravia, 1832; educated in Vienna, and appointed professor of history in the university there in 1860. In 1857 he received a governmental appointment in the department of the secret archives, which he was compelled to relinquish in 1865 on account of some indiscreet disclosures.

LORE'TO, SISTERS OF, or "Friends of Mary at the Foot of the Cross," a Roman Catholic sisterhood founded in Kentucky by Charles Nerinckx, a priest (1761–1824). The order is devoted to the cause of education and the care of destitute orphans, and has many establishments in the western states.

LORETTE', a beautiful village 9 m. from Quebec, a place of much resort, on account of its waterfall. The works for the supply of Quebec with water are here, and flour and paper are manufactured to some extent. Pop. about 1200, a portion of whom are Huron Indians.

LORET'TO (properly, LORETO), a city of the province of Ancona, in the kingdom of Italy, although of some architectural pretentions, and containing 5,300 inhabitants, is chiefly noticeable as the site of the celebrated sanctuary of the blessed Virgin Mary, called the *Santa Casa*, or holy house. The Santa Casa is reported to be the house, or a portion of the house, in which the Virgin lived in Nazareth, which was the scene of the annunciation of the nativity, and of the residence of our Lord with his mother and Joseph; and which, after the Holy Land had been finally abandoned to the infidel on the failure of the crusades, is believed to have been miraculously translated, first, in 1291, to Fiume in Dalmatia, and thence, Dec. 10, 1294, to Recanati, whence it was finally transferred to its present site. Its name (Lat. *Domus Lauretana*) is derived from Laureta, the lady to whom the site belonged. It would be out of place in a work like this to enter into any polemical discussion of this legend. Although numberless pilgrims resort to the sanctuary, and although indulgences have been attached by Julius II., Sixtus V., and Innocent XII. to the pilgrimages, and to the prayers offered at the shrine, yet the truth of the legend is no part of Catholic belief, and Catholics hold themselves free to examine critically its truth, and to admit or to reject it according to the rules of historical evidence. The church of the Santa Casa stands near the center of the town, in a piazza which possesses other architectural attractions, the chief of which are the governor's palace, built from the designs of Bramante, and a fine bronze statue of pope Sixtus V. The great central door of the church is surmounted by a splendid bronze statue of the Madonna; and in the interior are three magnificent bronze doors filled with bas-reliefs, representing the principal events of scriptural and ecclesiastical history. The celebrated holy house stands within. It is a small brick house with one door and one window, originally of rude material and construction, but now, from the devotion of successive generations, a marvel of art and of costliness. It is entirely cased with white marble, exquisitely sculptured, after Bramante's designs, by Sansovino, Bandinelli, Giovanni Bolognese, and other eminent artists. The subjects of the bas-reliefs are all taken from the history of the Virgin Mary in relation to the mystery of the incarnation, as the annunciation, the visitation, the nativity, with the exception of three on the eastern side, which are mainly devoted to the legend of the holy house itself and of its translation. The rest of the interior of the church is rich with bas-reliefs, mosaics, frescos, paintings, and carvings in bronze. Of this material the finest work is the font, which is a masterpiece of art. The holy house having been at all times an object of devout veneration, its treasury of votive offerings is one of the richest in the western world. It suffered severely in the French occupation of 1796, but it has since received numerous and most costly accessions. The frescos of the treasury chapel are among the finest to be found outside of Rome.

LORICA'TA, a name applied by Merren and Fitzinger to the crocodiles and those other reptiles which are provided with plated armor, *loricata* instead of *squamata*, the emydosaurians of De Blainville. The term is usually applied to the crocodiles alone.

L'ORIENT, a seaport of France, department of Morbihan, situated at the confluence of the Scorff and Blavet, in lat. 47° 48′ n., and long. 3° 25′ west. Pop. '72, 24,088. It is a well-built town, but rather dull-looking. The harbor, dockyard, and arsenal are among the best and largest in France, and the place ranks as a fortress of the third class; but its commerce received a blow at the revolution in 1789 from which it has never recovered. L'Orient has a communal college, a school of navigation, and another of marine artillery. The inhabitants are engaged chiefly in ship-building and the allied occupations. The only important manufacture is that of hats.

L'Orient owes its origin to the French East India company, which built an establishment here in 1666, for the purpose of trading to the east (whence the name of the town).

LOR'IKEET, a species of parrot very numerous in Australia and the eastern archipelago, having the tongue covered with bristly hairs, with which they collect honey from

flowers. They are of very beautiful plumage, and being gregarious present a most beautiful spectacle, flying in flocks containing sometimes over a thousand birds. They belong to the genus *trichoglossus*.

LORIMER (Fr. *lormier*, from Lat. *lorum*, a thong), a maker of bits, spurs, stirrup-irons, metal mountings for saddles and bridles, and generally of all articles of horse-furniture. In London, the lorimers, who had previously formed part of another guild, were incorporated by letters patent in 1712; in the Scottish burghs they have been comprehended as a branch of the corporation of hammermen. Cutlers, locksmiths, and brass-founders have been considered as in the exercise of branches of the lorimer art, and therefore bound to enter with the corporation. The court of session in 1830 held it to be a violation of the exclusive privileges of the lorimer craft to manufacture bits, stirrup-irons, and other metallic articles of horse-furniture, with a view to silver-plating them before selling.

LORIMER, GEORGE CLAND, b. 1837; lost his father while very young, and, his mother marrying again, he was brought up by his stepfather, who was connected with the theatrical profession in Edinburgh. He attended school in that city, and acted as call-boy in the theater in the evening; but at length went to sea for a time. On his return to Edinburgh he resumed his stage connection; and, after a time, went to Newcastle and Dublin, and in the latter city acted as assistant stage-manager at the Queen's theater. He was of a studious disposition, and employed his leisure in reading and in cultivating a knowledge of the classics. In 1855 he removed to America, and played in Louisville, Ky., with success. It was at this time, and at the age of 18 years, that he became so impressed with religious convictions that he joined the Baptist church and left the stage permanently. He now entered upon a collegiate course at Georgetown, Ky., where he received the degree of A.M. Some years later he took the degree of D.D. at Bethel college. In 1859 he was ordained at Harrodsburg, Ky., and took charge of a church in Paducah in that state in 1860. Later, he was called to the Walnut street church in Louisville, the one with which he had first united. In 1868 he removed to Albany, N. Y., and in 1870–71 to Boston, Mass., where he occupied the pulpit of the Shawmut Avenue church, and drew crowded audiences. He took charge of the congregation of Tremont Temple shortly after, and remained in that church six years, at the same time acting as associate editor of the *Watchman*. In 1879 he took charge of the First Baptist church in Chicago.

LORING, CHARLES GREELEY, LL.D., 1794–1867; b. Boston; graduated at Harvard in 1812; studied law, and for many years was eminent as a practitioner in his native city. From 1857 to 1867 he was actuary of the hospital life and trust company. He was author of *Neutral Relations of the United States and England*, a *Life of William Sturgis*, and various public addresses. Died at Beverly.

LORING, FREDERICK W., 1846–71; b. at Newtonville, Mass.; graduated at Harvard in 1870, and soon won a high reputation as a writer by his contributions to leading magazines and papers, and especially by a novel, *Two College Friends*, which was thought to exhibit rare powers and to give promise of high distinction. In the capacity of literary correspondent he joined the party of lieut. Wheeler, which was sent to explore Arizona, and was murdered by the Indians in that territory Nov. 5, 1871.

LORING, GEORGE BAILEY, b. North Andover, Mass., 1817; graduated at Harvard college in 1838, and at the Harvard medical school in 1842, after which for several years he was physician at the Chelsea (Mass.) marine hospital. Since 1850 he has devoted himself extensively to the study of science in its applications to agriculture, and to the pursuits of public life. Residing in Salem, he has several times represented that city in both branches of the legislature, and served for several years as president of the senate. He was also for many years president of the Massachusetts agricultural society, and a member of the republican national convention in 1868 and 1872. He enjoys a high reputation as a public speaker, and has often been the chosen orator upon occasions of popular interest. Some of his orations have had a wide circulation. In the state senate he made an effective plea for scientific education in support of the plans of the late prof. Agassiz, and spoke eloquently in defense of Charles Sumner's action in regard to the "regimental colors" used in the civil war. He was a member of congress from the Essex district, 1877–81, and has been a large contributor to Flint's *Agricultural Reports* and Murray's work *On the Horse*.

LORING, WILLIAM W., b. N. C. about 1815; served as lieut. of mounted volunteers in the Florida war of 1835–42; became capt. of mounted rifles 1846, and maj. 1847; commanded a regiment in the war with Mexico; was brevetted lieut.col. for bravery at Contreras and Churubusco, and col. for his gallant services at Chapultepec; lost an arm in the capture of the city of Mexico; was commander of an expedition against the Indians of New Mexico in 1857; resigned his colonelcy and entered the confederate army in 1861, where he was first a brig. and afterwards a maj.gen., serving in West Virginia, at Vicksburg, Chattanooga, etc. After the rebellion ended he went to Egypt and became chief of staff of the khedive.

LORINSER, KARL IGNAZ, 1796–1853; b. Bohemia; educated at Prague and Berlin, and for a time instructor in veterinary surgery in medical colleges at Berlin and Stettin, and subsequently medical councilor in various places. He published *Encyclopädie der Thierheilkunde*, 1820; *Untersuchungen über den Rinderpest*, 1831; and *Zum Schutze der Gesundheit auf Schüler*, 1836. The latter work made a great sensation, and led to the revival of gymnastic exercises in the German schools.

LO'RIS, a genus of *lemuridæ*, differing from the true lemurs in having a round head and short muzzle, very large eyes, and no tail. The two species known are both natives of the East Indies. The largest species, *L. tardigradus*, is not so large as a cat; the other, *L. gracilis*, is much smaller. They are nocturnal animals, and spend the day generally sleeping attached to a branch, which they grasp firmly with all their four hands, the body rolled up into a ball, and the head hidden among the legs. Their fur is rich and soft. Their motions are slow, and they advance stealthily and noiselessly on the insects and birds on which they prey. They feed, however, partly on fruits and other vegetable food; in confinement they readily eat rice and milk, and are very fond of eggs.

LORRAINE', originally a portion of the German empire. Its history dates from 855, when Lotharius II. obtained (see CARLOVINGIANS) the lands between the Scheldt, Rhine, Meuse, and Saône, called the kingdom of Lotharius (*Lotharii regnum*), or Lotharingia, or Lorraine. The district now known as Rhenish Prussia was separated from Lorraine in the 10th c., and the remainder was divided in 1044 into two duchies, *Upper* and *Lower* Lorraine. The latter, after many vicissitudes, came into the possession of Austria, and now forms one-half of the kingdom of Belgium, and the provinces of Brabant and Gelderland, in Holland. Upper Lorraine continued to be governed by its own dukes till 1736, when it was given to Stanislas, ex-king of Poland, and on his death in 1766 was united to France. It was afterwards subdivided into the departments of the Meuse, Moselle, Meurthe, and Vosges. The inhabitants are of German origin, but speak the French language, with the exception of the district lying between Metz and the Vosges, which is called *German Lorraine*. This tract was ceded to Germany at the peace of 1871.

LORRAINE', CHARLES DE, Cardinal, 1525–74; b. France; became archbishop of Rheims when only 13 years of age, succeeding his uncle, Jean de Lorraine. Having officiated at the coronation of Henry II. in 1547, he was made cardinal. He was now employed on various diplomatic missions, which he conducted with success, gaining a high reputation for skill and astuteness in delicate negotiation. He was, however, suspected by the king, and but for the influence of Diana of Poictiers would have lost the royal favor. This at length happened on his quarreling with Diana, but having officiated at the coronation of Francis II. he became finance minister. In 1561 he officiated for the third time at a coronation, that of Charles IX., and in 1569 was sent to Spain to negotiate a marriage between that monarch and Elizabeth of Austria. He is said to have endeavored to introduce the inquisition into France, and to have favored the massacre of St. Bartholomew, though he was away from France at the time. He was warmly interested in letters, founded the university of Rheims, and was a brilliant orator and writer; but he was a bigot, ambitious, cruel, and vain.

LORRAINE, CLAUDE. See CLAUDE LORRAINE.

LORRAINE, CLAUDE (CLAUDE LORRAINE, *ante*). The name of Claude Lorraine glass is given to peculiarly tinted glass, sometimes used in opera-glasses and stereoscopes, which is supposed to give to the objects viewed the coloring characteristic of the artist's works. The term is used, however, by artists and opticians as the name of an appliance consisting of a plate of glass ground very slightly convex on the exterior and concave on the inner side and coated with a surface of black composition highly polished. This is so placed as to reflect a landscape, which may be then drawn from the reduced image in the glass, the convexity of surface assisting in the perspective and distance.

LORTZING, ALBERT GUSTAV, 1803–51; b. Prussia; went upon the stage when very young, retaining his connection with it as actor, singer, or composer till his death. He is best known as the composer of *Zar und Zimmermann; Undine;* and *Der Wildschütz*.

LORY, *Lorius* a genus of birds of the parrot family (*psittacidæ*), natives chiefly of the s.e. of Asia and the eastern archipelago. They have a dense soft plumage, exhibiting the most rich and mellow colors; the tail is rounded or graduated, generally not long; the bill is feebler than in many of the parrots, and the upper mandible much arched. They are very active and lively, even in confinement, and are also of very gentle and affectionate disposition. Red, scarlet, crimson, and yellow are the prevailing colors of their plumage; but the name lory is often extended to some Australian birds of the same family, in which much more of a green color appears, and which have a stronger bill and a much less gentle disposition. The true lories feed much on the softest and most juicy fruits; the Australian birds so called are very troublesome as robbers of the fields of ripening maize.

LOS ANGELES, a s. co. of California, 2,125 sq.m.; pop. '80, 33,379. The Pacific ocean bounds it on the s. and s.w.; its climate is semi-tropical; the productions are fruits, nuts, and grapes, live-stock, wool, grain, and olives. There is a large production of wine and brandy. In the n. region the surface is dry and sandy, but the valleys that intersect the coast range are many of them fertile. Watered by the Los Angeles river,

irrigation is practiced in some parts, and artesian wells are depended upon for drinking water. There are hot springs possessing medicinal properties. The Southern Pacific railroad, in progress, will make connection with San Francisco, to which point steamers run from Santa Monica. Co. seat, Los Angeles.

LOS ANGELES, a city in s. California, on the river of the same name, 30 m. from its mouth; pop. '80, 11,311; reached by the Southern Pacific railroad from San Francisco. It is connected with Santa Monica, on the coast, by a railroad 18 m. long: from this point there is also communication with San Francisco by steamer. Originally settled by the Spaniards in 1780, it was called by them *Pueblo de Los Angeles*, "town of the angels," from the extreme beauty of its situation and the charm of its climate. It was built of adobe; but the old structures have been destroyed in most instances, and replaced by larger and more imposing buildings. The Los Angeles valley is very fertile, and the city is the center of the orange-growing industry of California, while the plain below is covered with fine vineyards; lemons and olives also are largely cultivated. The climate of Los Angeles is mild and delightful, and it is greatly frequented by invalids, who prefer it even to San Diego, on account of its freedom from the coast winds. It is the market for the interior of that part of California, and does a thriving business. It contains public schools, a college (St. Vincent's), a library, and several newspapers, English, German, and Spanish.

LOS HERREROS. Se BRETON DE LOS HERREROS, *ante*.

LOSKIEL, GEORGE HENRY, 1740–1814; b. Courland, Russia; entered the ministry of the Moravian church, and wrote a history of the missions of that church among the Indians of North America from the accounts of the missionaries Gottlieb Spangenburg and David Zeisburger; was ordained a bishop at Hernhutt in 1802, and came at once to the United States as superintendent of the Moravian churches and pastor at Bethlehem, Penn., where he died.

LOSSING, BENSON JOHN, LL.D., 1813; b. New York. After serving an apprenticeship at the watch-making trade, he became editor, in 1835, of the *Poughkeepsie Telegraph*, and in 1836 of the *Poughkeepsie Casket*, a literary magazine, with illustrations by himself. In 1838 he began business in New York as a wood-engraver, during the next ten years editing and furnishing the illustrations for the *Family Magazine* and the *Young People's Mirror*. He had already begun the study of American history, to which he henceforward devoted himself. He traveled extensively in the United States, visiting and making sketches of places of historical interest, and contributing illustrated articles on historical subjects to various periodicals. Among his numerous works may be mentioned *Pictorial Field-Book of the Revolution*, 1852; *Pictorial History of the United States*, 1854; *Life of Washington*, 1860; *The Hudson*, 1866; *Pictorial History of the Civil War*, 1866–69; *Pictorial Field Book of the War of* 1812; *Our First Century*, 1876; *Story of the U. S. Navy for Boys*, 1880; and *Cyclopædia of U. S. History*, 1881. He is an admirably picturesque, instructive, and interesting historical writer, and his works have for years been very popular.

LOSSI'NI (Ger. *Lussin*), an island in the gulf of Quarnero, Adriatic sea, forming part of the Austrian Küstenland, lies immediately s.w. of Cherso (q.v.). Length, 21 m.; breadth, from 1 to 3 miles. The principal place on the island is Lossini Piccolo, or Little Lossini, with 7,100 inhabitants, a fine harbor, and an active trade.

LOSS OF SPEECH. See APHASIA, *ante*.

LOST PROPERTY. In point of law, the finder of lost property is entitled to keep it until the owner is found; but there are certain circumstances in which the keeping of it will be construed by a jury to amount to larceny. The rule which seems to be laid down in recent cases in England which have been fully discussed, is, that if the finder find the property in such circumstances that he either knows the owner, or has ready means of discovering him, then the taking of the property with intent to keep it will be larceny. If, for example, a servant find a sovereign in her master's house, and keep it, that would be larceny. So it was held to be larceny where the prompter on the stage of a theater picked up a £50 note which had been dropped by one of the actors. On the other hand, if there be no reasonable probability of ever discovering the true owner, then there is no larceny. The all important point of time for the jury to inquire into is, when the finder picked up the article; for if, on examination, he did not then know who the owner was, nor had the means of ascertaining, he will not become guilty merely because he afterwards, on hearing of the owner, nevertheless keeps it. It has also been decided that the mere keeping of a lost article, in hopes of getting a reward for giving it up, and though the owner be known, does not amount to larceny. There is also no obligation on the finder of lost property to incur expense in advertising for the owner; indeed, the owner would not be bound in England to repay such expense, though it might be different or doubtful in Scotland; and it is to be borne in mind that the real owner is not divested of his property by the loss, but can demand it from whosoever is in possession of it. But there are some peculiarities on this subject as regards lost bills of exchange and notes, which, though originally lost, yet, if transferred without notice, become the property of the transferee. Moreover, the loser of a bill or note payable to bearer cannot sue the party liable, at least without giving an indemnity.

There is an exception to the rule, that the finder of lost property is entitled to it, where the property consists of gold, silver, etc., hidden in the earth, in which case the treasure-trove belongs not to the finder, but to the crown; and the finder is bound to give notice thereof to the crown, under a penalty.

LOST TRIBES. See BABYLONISH CAPTIVITY.

LOT (ancient *Oltis*), a river of southern France, one of the largest tributaries of the Garonne, rises at Mt. Lozère, in the Cevennes. It flows in a generally western direction through the department of Lozère, Aveyron, Lot, and Lot-et-Garonne, joining the Garonne from the right at Aiguillon, after a course of 270 miles. It is navigable for about 170 miles.

LOT, a department in the s. of France, formed out of the province of Guienne, and comprising the arrondissements of Cahors, Gourdon, and Figeac, is watered by the Dordogne and the Lot, with its tributary, the Sellé. Area, 2,005 sq.m.; pop. '76, 276,512. A range of hills, broad, but not very high, and containing some iron, runs through the center of the department from e. to w., in the form of a semicircle. The valleys yield corn, hemp, tobacco, and fruits, and the hillsides are clothed with vines. Flax-mills are numerous. Capital, Cahors (q.v.).

LOT, properly that which falls to one as his portion, and then a die or anything used in determining events by chance. The custom of deciding doubtful questions by lot is of high antiquity and of great extent. Among the Hebrews, the land of Canaan was divided by lot among the tribes, and the cities distributed among the priests and Levites. The choice of men for an invading force, the apportionment of possessions, spoil or prisoners to captors or foreigners, the detection of a criminal as Achan, the selection of the scapegoat on the day of atonement, and the appointment of persons to office as in the choice of an apostle,—in all these cases the lot was used, but always with solemn reference to the interposition of God. We have no information as to the precise manner of casting lots; several modes may have been practiced. Among the ancients, with whom the use of the lot was very general, it was considered as a sort of appeal to the Almighty, free from all influence of passion or bias. Among the heathen, the choice of a champion in combat, the decision of fate in battle, the appointment of magistrates, priests, or other functionaries, the division of conquered or colonized land, was done by lot. There was a mode of divination with pagans by means of arrows, two inscribed and one without mark; and among the Germans the practice of deciding by marks on twigs, as mentioned by Tacitus. The Greeks and Romans were accustomed to divine events by marking various lots with a prophetic verse. Also, on opening the works of the poets, they considered the passage which they first saw as an oracle. The Bible has been used in the same way, the use of words or passages chosen at random from Scripture being received as a token of the divine will. *Sortes Biblicæ* prevailed among Jews and among Christians, though denounced by several councils. Election by lot prevailed in the Christian church as late as the 7th century.

LOT, a biblical character, son of Haran, the brother of Abraham, and the grandson of Terah. The events of his life will be found in Gen. xi.-xix. After the death of Terah, Abraham and Lot journeyed from Haran to Canaan, and thence into Egypt; and again returned to Bethel, where they accumulated great wealth, until, quarrels arising between their servants, separation was agreed upon. Lot crossed the Jordan and dwelt near the wicked city of Sodom, which afterwards was destroyed on account of its fearful depravity. Lot, warned of the Lord, fled to Zoar. From Zoar, Lot retreated to a cave in the mountains, and became the father of Moab and Ben-ammi, from whom descended the Moabites and Ammonites. This nephew of Abraham is set forth in Scripture as a man of low moral tone—falling into evil through self-seeking.

LOTBINI'ERE, a co. in e. Quebec, having the St. Lawrence river for its n. boundary; intersected in the e. portion by the Grand Trunk railway; 735 sq.m.; pop. '71, 20,606. It is drained by the river Du Chene and the Beaurirage river, emptying into the St. Lawrence. Its industries are represented by foundries, saw mills, grist mills, and carding and fulling mills. Seat of justice, Lotbiniere.

LOT-ET-GARONNE, a department in the s.w. of France, formed out of the province of Guienne, and comprising the arrondissements of Agen, Villeneuve, Marmande, and Nérac, is watered principally by the Garonne and the Lot. Area, 2,060 sq.m.; pop. '76, 316,920, among whom are a considerable number of French Protestants. The department is level, except in the s., where spurs of the Pyrenees make their appearance, and extremely fertile in the basins of the large rivers; but the e. is chiefly composed of barren wastes, and the s.w. of sandy and marshy tracts termed *landes*. The principal products are corn, wine, excellent hemp, fruits (of which the *prunes d'entes* of Agen are particularly celebrated), tobacco (considered the best manufactured in France), anise, and coriander. Pine, cork, and chestnut woods are numerous; domestic animals, especially poultry, are reared in great numbers for exportation. The chief metal is iron, and the department has 10 iron-works, besides various manufactures more or less important.

LOTHAIRE' I., King of Italy, 796–885; son of Louis le débonnaire, and suzerain over his two brothers, Pepin and Louis, with whom he shared the empire of the west. He was crowned king of Italy by the bishop of Milan in 822, having been already named

king of the Lombards two years before. Having dethroned his father, his two brothers opposed him and defeated him at Fontenay in 841. In 843 a treaty was made at Verdun, by which a satisfactory distribution of the empire was made, Lothaire receiving for his share Italy and some French provinces beyond the Rhine and the Rhone and the title of emperor. One of the French districts was afterwards called Lotharingia, after Lothaire, the son of the emperor, who was its first king. From this designation arose the name Lorraine.

LOTHAIRE II., THE SAXON, King of Germany, 1075–1137; succeeded Henry V., after having had alternate feuds and reconciliations with that monarch and his predecessor, Henry IV., during a period of 25 years. Having allied himself with pope Innocent II., he defeated the duke of Swabia in 1132, and Innocent crowned him emperor of Rome, June 4, 1133. He afterwards made an expedition for the purpose of driving Anacletus, the antipope, out of Italy, and was completely successful, but was seized with severe illness while on his return and died. The session of the diet of Madgeburg, 1135, occurred during his reign, when the first regulations of the German empire were formulated.

LOTHARINGIA. See LORRAINE, *ante*.

LOTHIANS. See SCOTLAND.

LOTHROP, SAMUEL KIRKLAND, D.D., b. Utica, N. Y., 1804; graduated at Harvard in 1825; ordained at Dover, N. H., in 1829, where he remained until 1834, when he became pastor of the Brattle Street church (Unitarian) in Boston. He wrote the *Life of Samuel Kirkland*, his grandfather, for Sparks's collection of biographies, and a *History of Brattle Street Church*. Many of his occasional sermons and addresses have been published.

LOTHROP, THOMAS, b. probably in England; was a citizen of Salem, Mass., in 1634, and a representative of that city in the "general court" in 1647, '53, and '64. He subsequently settled in Beverly, where he founded a church and was prominent in civil affairs, representing the town four years in the "general court." On the breaking out of king Philips's war he led a company of militia, called "the flower of Essex," to Deerfield, where they were surprised and nearly all killed by the Indians, Sept. 29, 1675. A marble monument was erected in 1838 at "Bloody Brook," where the massacre took place, in memory of capt. Lothrop and his companions.

LOTIONS, or WASHES, are remedies of a liquid, but not of an oily nature, which are applied to circumscribed portions of the surface of the body. Amongst the lotions most commonly employed are the *muriate of ammonia wash*, which consists of a solution of sal ammoniac in water or in vinegar with or without the addition of spirit; it is much used in contusions, where there is no wound of the skin, in chronic tumors, in enlarged joints, etc. *Chloride of soda wash*, consisting of solution of chlorinated soda diluted with from ten to twenty times its volume of water, useful as a gargle in ulceration of the mouth and throat, and as a wash for foul ulcers generally. The *chloride of lime wash*, consisting of one or two drams (or more) of chloride of lime in a pint of water, used for the same purposes as the preceding wash; and *black wash*, prepared by adding calomel to lime-water (generally a dram of the former to a pint of the latter), most extensively used in venereal sores, and of service in many forms of intractable ulcers.

LOTOPHAGI (Gr. lotus-eaters), a name applied by the ancients to a peaceful and hospitable people inhabiting a district of Cyrenaica, on the n. coast of Africa, and much depending for their subsistence on the fruit of the lotus-tree, from which they also made wine. According to Homer, they received Ulysses hospitably, when, in the course of his wanderings, he visited them along with his companions, on whom, however, the sweetness of the lotus-fruit exercised such an influence that they forgot all about their native country, and had no desire to return home. This feeling of happy languor has been expressed with marvelous felicity by Tennyson in his poem on the lotus-eaters.

LOTTERY, a game of hazard, in which prizes are drawn by lot. Usually, a lottery comprises a specified quantity of tickets, each numbered, every ticket-holder having a right to draw from a box a prize or blank, as the case may happen to be, and thus gain or lose. Lotteries are, of course, got up for the sake of the profit which they may yield to their proprietors; for the aggregate sum expended in prizes always falls short of the aggregate purchase-money for tickets. Whatever be the actual form of the lottery, it is indisputably a gambling transaction, the risks and losses of which are now acknowledged to be demoralizing. Lotteries are said to have been first employed by the Genoese government as a means of adding to the revenue of the country, and the bad example was soon followed by the governments of other nations. The first lottery in England appears to have been in the year 1569, and the profits went to the repair of harbors and other public works. The same means was frequently afterwards resorted to for additions to the revenue, or for particular objects, under control or by sanction of the government, the mode of conducting the lottery, and the conditions, being from time to time varied. In the early years of the present century, the state lottery, as it was usually called, was one of the regular institutions of the country. Usually, the number of tickets in a lottery was 20,000, at a value of £10 each in prizes. At this valuation they were offered to the competition of contractors, and ordinarily assigned at an advance of

£5 or £6 per ticket. The contracting party sold them to the public at a further advance of £4 to £5 per ticket; and thus the value was about doubled. The contractor devised the scheme of prizes and blanks—there being always a few prizes of large amount to tempt purchasers. To accommodate persons with moderate means, certain tickets were divided into halves, and others into quarters, eighths, or sixteenths. A common price for a sixteenth was £1 11s. 6d. In the event of the number which it bore being drawn, a prize of £20,000, a sixteenth part of that sum was paid, and so on with other prizes. The dexterity of the contractors consisted in drawing up "schemes," which in all varieties of placards and hand-bills were issued in profusion through the means of agents all over the country. The drawing took place on a specified day or days in a public hall in London, before certain commissioners, and was in this wise. Two machines, called "wheels," were appropriated, one for the numbers, and the other for the prizes and blanks. On a number being drawn, its fate was determined by the billet which next afterwards came out. Two boys were the operators, one at each wheel. On the grounds of injury to public morals, lotteries were altogether abolished by act of parliament in 1826. Persons advertising or circulating tickets for foreign lotteries may be sued for a penalty by the attorney-general, or lord-advocate, or the commissioners of stamps. It required a special statute, therefore, to legalize art-unions, which are only lotteries under a specious form; but owing to their supposed good effects in encouraging art, they were exempted from penalties by the statute 9 and 10 Vict. c. 48, and a similar voluntary association was excepted by the statute 21 and 22 Vict. c. 102. In France, the abolition of lotteries took place in 1836, and in Hesse-Darmstadt in 1852. The other German states, however, continued the use of them; and in 1841, Prussia derived from them a revenue of more than 900,000 thalers. Austria, of 3,600,000 florins. In the kingdom of Italy lotteries still exist. Few worse ways of supplying the exchequer of a country have almost ever been imagined; and the only excuse urged is, that the gambling spirit exists, and will find some means of gratification, even if lotteries were abolished. It was found, however, in France that the abolition of lotteries was immediately followed by an increase of savings-bank deposits; and it has been everywhere observed that the purchasers of lottery-tickets have been to a great extent persons belonging, not to the wealthiest classes of society, but to those in which economy and prudence are most necessary to the comfort of families and the general welfare of the state.

LOTTERY (*ante*). In this country lotteries were generally tolerated, though not without earnest remonstrances from some quarters, until about 1830, when the opposition to them assumed a tangible form, and not long afterwards they were forbidden by law in several states, and opposed by a strong public sentiment in others. Before this time they were chartered for a great variety of objects, such as the erection of colleges, academies, asylums, hospitals, and even houses of worship. As a convenient way of raising money for public and charitable objects, they were for a long time tolerated by men of influence, who were not wholly blind to their demoralizing tendency. As early as 1699 an assembly of ministers in Boston denounced them as a "cheat," and their agents as "pillagers of the people;" but such testimonies, being generally regarded as too straitlaced and puritanic, exerted but a feeble influence. For a whole century and more afterwards, lotteries were in fair repute as a means of raising money for public and charitable objects. Indeed, it was not until after 1830 that any organized movement for their suppression was made. In Boston, in 1832, an association of young men connected with Dr. Lyman Beecher's church, after a careful investigation of the subject in all its bearings, condemned them and called for their extermination on grounds of morality and public policy. This action was extensively approved by the press, and did much to create a sound public opinion in New England. In 1833 Job R. Tyson of Philadelphia published *A Brief Survey of the Great Extent and Evil Tendencies of the Lottery System of the United States*, and in the same year a society was formed in Pennsylvania to promote the abolition of the system, which was accomplished within a year or two in Pennsylvania, Massachusetts, and Connecticut. Maryland followed in 1836, and from this time the progress of the reform was rapid. At the present time it may be said that lotteries are under legislative ban in every state of the union, though in a few states the laws on this subject, being partly prospective in their application, have not yet been carried into full effect. In most, if not all the states, the sale of tickets for foreign lotteries is prohibited, and to advertise them is a penal offense. A few years ago the so-called "art unions" were permitted to dispose of pictures and statuary by lottery; but this is now generally forbidden.

LOTUS. The name *lotos* (Lat. *lotus*) was given by the Greeks to a number of different plants whose fruit was used for food. One of the most notable of these is the *zizyphus lotus*, a native of the n. of Africa and the s. of Europe, belonging to the natural order *rhamneæ*. See JUJUBE. It is a shrub of two or three feet high, and its fruit, which is produced in great abundance, is a drupe of the size of a wild plum, with an almost globose kernel. This fruit is somewhat farinaceous, and has a pleasant, sweetish, mucilaginous taste. It is called by the Arabs *nabk* or *nabka;* and has, from the earliest times, served as an article of food to the inhabitants of the n. of Africa, where it is still a principal part of the food of the poor. Probably it was on this fruit that Homer's *lotophagi* (q.v.) lived.—The fruit of the *diospyrus lotus*, or date plum, was sometimes

called the lotus. See DATE PLUM.—The name lotus was also given to several beautiful species of water-lily (q.v.), especially to the BLUE WATER-LILY (*nymphæa cærulea*) and the EGYPTIAN WATER-LILY (*N. lotus*), and to the nelumbo (q.v.) (*nelumbium speciosum*), which grow in stagnant and slowly running water in the s. of Asia and n. of Africa. The *nymphæa lotus* was called by the Egyptians *shnin* or *seshin*, and is called by the Arabs *beshnin*, the Coptic name with the masculine article. It grows in the Nile and adjacent rivulets, and has a large white flower. The root is eaten by the people who live near the lake Menzaleh. The rivulets near Damietta abound with this flower, which rises two feet above the water. It was the rose of ancient Egypt, the favorite flower of the country, and is often seen made into wreaths or garlands, placed on the foreheads of females, or held in their hands, and smelled for its fragrance. It frequently appears in the hieroglyphs, where it represents the upper country or southern Egypt, and entered largely into works of art—the capitals of columns, prows of boats, heads of staves, and other objects being fashioned in its shape. In the mythology, it was the special emblem of *Nefer Atum*, the son of Ptah and Bast; the god Harpocrates is seated upon it; and there was a mystical lotus of the sun. In the mythology of the Hindus and Chinese the lotus plays a distinguished part. It is the nelumbo. The Hindu deities of the different sects are often represented seated on a throne of its shape, or on the expanded flower. The color in southern India is white or red, the last color fabled to be derived from the blood of Siva, when Kamadeva, or Cupid, wounded him with the love-arrow. Lakshmî, also, was called the "lotus-born," from having ascended from the ocean on its flower. It symbolized the world; the *meru*, or residence of the gods; and female beauty. Among the Chinese, the lotus had a similar reputation and poetic meaning, being especially connected with Fuh, or Buddha, and symbolizing female beauty, the small feet of their women being called *kin leën*, or "golden lilies."

Wilkinson, *Mann. and Cust.*, iii. 187, 200, iv. 44, 63, v. 264, 269; Jomard, *Descr. de l'Eg.*, t. 1, s. 5; Homer, *Il.* xii. 238, iv. 171, *Od.* ix. 92; *Herodotus*, ii. 96, iv. 177; *Died. Sic.* i. 34; Coleman, *Mythology of the Hindus.*

LOTZE, RUDOLF HERMANN, b. Saxony, 1817; educated at the gymnasium of Zittau and the university of Leipsic, graduating in 1838 in medicine and philosophy, and in the following year filling the chair of philosophy at Leipsic as an adjunct professor. In 1842 he was made extraordinary professor at the university of Leipsic, and two years later ordinary professor at Göttingen. He has written voluminously on metaphysics, leaning toward the doctrines of Leipnitz and Herbart. Among the more important of his works are *Metaphysik* (Leipsic, 1841); *Logik* (1843); *Mikrokosmus* (3 vols., 1856–64); and *Geschichte der Aesthetik in Deutschland* (Munich, 1868, *et seq.*) His rank among living metaphysicians is high, though the estimates of him differ among different schools of thinkers.

LOUDON, a co. of e. Tennessee, traversed by the Tennesee river, and intersected by the East Tennessee, Virginia and Georgia railroad; 300 sq.m.; pop. '80, 9,148. It extends through a beautiful and fertile valley, and produces largely of grain and live stock. Co. seat, Loudon.

LOUDON, or LOUDOUN, co. in n.e. Virginia, bounded on the n.e. by the Potomac river, which separates it from Maryland; intersected by the Washington and Ohio railroad; 460 sq.m.; pop. '80, 23,634. The Blue ridge is on the n.w. border of this county, and the Kittoctan mountain is in the center. Its productions are wheat, Indian corn, oats, potatoes, wool, butter, and hay. It has a number of manufactories and mills. Co. seat, Leesburg.

LOUDON, GIDEON ERNEST, See LAUDOHN.

LOUDON, JOHN CLAUDIUS, a distinguished botanist and horticulturist; b. April 8, 1783, at Cambuslang, in Lanarkshire. He became a gardener, and in 1803 published *Observations on Laying out Public Squares*, and in 1805 a *Treatise on Hot-houses;* and afterwards became the author of a number of works on botany, mostly of a somewhat popular character, which have contributed much to extend a knowledge of that science and a taste for horticulture. Among these are the *Encyclopædia of Gardening* (1822); and *of Agriculture* (1825); the *Green-house Companion* (1825); the *Encyclopædia of Plants* (1829); and the *Arboretum et Fruticetum Britannicum* (8 vols. 1838), containing a very full account of the trees and shrubs, indigenous or introduced, growing in the open air in Britain. This last is his great work; but the expense attending the publication, owing chiefly to the number of plates, involved him in pecuniary difficulties. He died at Bayswater, Dec. 14, 1843. Loudon established four different magazines, which he edited simultaneously with his *Arboretum.*—His widow is the author of a number of pleasing popular works, chiefly on subjects connected with botany and gardening.

LOUGH'BOROUGH, a manufacturing and market-t. of England, in the co. of Leicester, 12 m. n.n.w. of the town of that name. The chief educational institution in the town is the Burton foundation (dating from 1495), with an annual income from endowment of £1742 16*s*. With this Foundation five distinct schools are connected, each pupil having to pay a small sum. Loughborough carries on extensive manufactures of patent Angola hosiery, of other woolen and cotton goods, elastic webs, net-lace, and shoes. Pop. '71, 11,588.

LOUGHREA', a market t. of Ireland, in the co. of Galway, about 20 m. e.s.e. of the town of that name. It stands on the n. bank of Lough Rea, a beautiful little lake 4 m. in circumference. It contains a Roman Catholic chapel, with a Carmelite friary and nunnery, and the remains of a Carmelite abbey founded in 1300. Manufactures of narrow linen and coarse diapers; brewing and tanning are carried on. Pop. '71, 3,072.

LOUIS OF BADEN (LOUIS WILLIAM I.), Margrave of Baden-Baden, 1655–1707; b. Paris; was a soldier under Montecuculi against the French, and fought the Turks in 1683 with great valor. In 1693 he recaptured Heidelberg, then in the hands of the French, being then in supreme command of the imperial army. He also fought with success in Alsace. He attempted to succeed John Sobieski as king of Poland, but was unable to accomplish his purpose. He was esteemed a general of rare ability, and not less an engineer of talent. In the latter capacity he designed certain important military works on the Rhine.

LOUIS I., King of Bavaria. See LUDWIG I., KARL AUGUST, *ante*.

LOUIS IV., THE BAVARIAN, Emperor of Germany, 1285–1347; b. Germany; son of Louis the severe, duke of Bavaria; pursued his early studies under the direction of his mother, Matilda, daughter of the emperor Rudolph I. of Hapsburg. His father being dead, he became co-heir with his brother Rudolph, and co-regent of the realm. In 1314 he was elected the successor of Henry VII. of Luxembourg, who had died in Italy the previous year, the majority voting for him, but a large minority declaring at Cologne in favor of his cousin, Frederick the fair, called Frederick le bel, of Austria (son of the emperor Albert I. and grandson of Rudolph of Hapsburg), proclaiming him emperor Frederick III. Louis was victorious in the battle of Mühldorf, Sept. 28, 1322, bringing to a close a long and ruinous war, which had laid waste a large part of Germany, and taking Frederick prisoner compelled him to renounce all claim to the succession. In 1323, having by his support of the Viscontis in Milan caused the estrangement of pope John XXII., he was excommunicated Mar. 21, 1324, and commanded by the pope to appear before him; but he appealed to a general council, and the summons was declared null and void by the diet of Ratisbon. In 1324 he married Margaret of Holland. In 1325 a treaty was formed by which Frederick was released from imprisonment on condition that he would return and deliver himself again to Louis if he found himself unable to induce his adherents to transfer their allegiance. The contrary being the result, the vanquished returned into captivity in conformity with his oath, and was appointed governor of his own Bavarian possessions. In 1327 Louis defied the pope of Rome, accusing him of heresy, and was crowned king in Milan, receiving at Rome in 1328 the sacred sanction of the bishops of Venice and Aleria. Through his influence pope John was deposed, and Peter de Corbiére, called Nicholas V., was established antipope. This movement resulting in general unpopularity, he returned to Germany to defend his possessions there, which were continually threatened by John XXII. and his successors, Benedict XII. and Clement VI., with their foreign allies, assisted by French intrigues. He added to his strength in Germany the dominions of Holland, Zealand, Friesland, etc., which had come to him with his wife, Margaret of Holland. He was suddenly killed by a fall from his horse while hunting at Fürstenfeld, near Munich.

LOUIS I. See CARLOVINGIANS.

LOUIS I., LE DÉBONNAIRE OR THE PIOUS (*ante*), Roman emperor, king of the Franks, 778–840; b. at Casseneuil; son of Charlemagne by his third wife, Hildegarde. His elder brother having died he succeeded his father in 814. He was quite successful for a time, but in 817 he was persuaded to give his three sons, Lothaire, Pepin, and Louis, a share in his dominions, and from this arose complications that finally led to a dissolution of the empire. Bernard, a nephew of Louis, who had inherited Italy after his father, receiving nothing under the new arrangement, revolted; but the emperor allured him to Chalons, made him a prisoner, put out his eyes, and gave Italy to his son Lothaire. In his remorse for this crime the emperor sought consolation in the church, and thenceforth was a mere tool in the hands of the priests. In 819 he married a second wife, Judith of Bavaria, who in 823 bore him a son, known in history as "Charles the bald." In 829, in the interest of this son, he proposed a new division of the empire; but to this the elder sons objected, and the result was a war which lasted during the remainder of the emperor's life. Twice the father was defeated, taken prisoner, and deposed by his sons; but Lothaire, by his ambition to turn everything to his own account, incurred the hostility of his brothers, who conspired to raise the father again to the throne. On the death of Pepin in 838 Louis I. proposed to exclude his elder sons, Lothaire and Louis, from their inheritance, and to give his dominions to Charles the bald. Against this arrangement Louis revolted, and was joined by the sons of Pepin. In the midst of the war the emperor died at Ingelheim and was buried at Metz.

LOUIS II., LE BÈGUE, King of France (see CARLOVINGIANS, *ante*), b. in 846; a son of Charles the bald; reigned 877–79.

LOUIS III., King of France (see CARLOVINGIANS, *ante*), b. 863; eldest son of Louis II. The kingdom being divided in 879 between his brother Carloman and himself, he had allotted for his share that portion called Neustria. The Normans having invaded

France, he successfully resisted them and gained a battle. At his death, at about the age of 20 years, Carloman reigned alone over France.

LOUIS IV., D' OUTREMER, King of France (see CARLOVINGIANS, *ante*); reigned 927–54; a son of Charles the simple; was educated in England at the court of king Athelstane, his mother's brother. On the death of Raoul of Burgundy in 936 he was called to the French throne by Hugh of Paris and William of Normandy, by whose intrigues his reign was constantly disturbed.

LOUIS V., LE FAINÉANT, King of France (see CARLOVINGIANS, *ante*), b. 966; son of Lothaire and Emma; reigned 986–87; the last king of the Carlovingian dynasty.

LOUIS VI., THE FAT; VII.; VIII., THE LION; IX., SAINT LOUIS (LOUIS IX., *ante*), Kings of France. See CAPETIAN DYNASTY, *ante*.

LOUIS IX., or SAINT LOUIS, King of France, b. in Poissy, April 25, 1215, succeeded his father, Louis VIII., in 1226. His mother, Blanche of Castile, a woman of great talent and sincere piety, was regent during his minority, and bestowed on him a strictly religious education, which materially influenced his character and policy. When Louis attained his majority he became involved in a war with Henry III. of England, and defeated the English at Taillebourg, at Saintes, and at Blaye in 1242. During a dangerous illness he made a vow that if he recovered he would go in person as a crusader, and, accordingly, having appointed his mother regent, he sailed in Aug., 1248, with 40,000 men to Cyprus, whence, in the following spring, he proceeded to Egypt, thinking, by the conquest of that country, to open the way to Palestine. He took Damietta, but was afterwards defeated and taken prisoner by the Mohammedans. A ransom of 100,000 marks of silver procured his release on May 7, 1250, with the relics (6,000 men) of his army. He proceeded by sea to Acre, and remained in Palestine till the death of his mother (Nov., 1252) compelled him to return to France. He now applied himself earnestly to the affairs of his kingdom, united certain provinces to the crown on the lapse of feudal rights or by treaty, and made many important changes, the general tendency of which was to increase the royal power. A code of laws was brought into use, known as the *Etablissements de St. Louis*. Louis embarked on a new crusade July 1, 1270, and proceeded to Tunis; but a pestilence breaking out in the French camp, carried off the greater part of the army and the king himself. He died Aug. 25, 1270; and his son, Philip III., was glad to make peace and return to France. Pope Boniface VIII. canonized him in 1297. For an interesting picture of the religious side of Louis's character, consult Neander's *Kirchengeschichte*. Bohn, vol. vii., pp. 416–18.

LOUIS XI., King of France, the eldest son of Charles VII., b. at Bourges, July 3, 1423, was from his boyhood eminently cruel, tyrannical, and perfidious. He made unsuccessful attempts against his father's throne, was compelled to flee to Brabant, and sought the protection of Philip the good, duke of Burgundy, with whom he remained till his father's death in 1461, when he succeeded to the crown. The severe measures which he immediately adopted against the great vassals led to a coalition against him, at the head of which were the great houses of Burgundy and Bretagne. Louis owed his success more to his artful policy than to arms; and the war threatening to break out anew, he invited Charles the bold, duke of Burgundy, to a friendly conference at Péronne, in Oct., 1468. His agents, meanwhile, had stirred up the people of Liege to revolt against the duke, upon the news of which occurrence Charles made the king a prisoner, and treated him roughly. On the death of the duke of Burgundy in 1477, who left an only daughter, Louis claimed great part of his territories as male fiefs lapsed to the superior, and wished to marry the young duchess to his eldest son, a boy of seven years. On her marriage with the archduke Maximilian, he flew to arms; but a peace was concluded at Arras, Dec. 25, 1482, by which the daughter of Maximilian was betrothed to the dauphin (afterwards Charles VIII.), and the counties of Burgundy and Artois were handed over to France. Louis was also successful—after the use of means far from honorable—in annexing Provence to the crown as a lapsed fief. He greatly increased the power of the French monarchy. The latter years of his reign were spent in great misery, in excessive horror of death, which superstitious and ascetic practices failed to allay. He died Aug. 30, 1483. It was calculated that he put about 4,000 persons to death in the course of his reign, mostly without form of trial. Yet he was a patron of learning, and is said to have been the author of *Les cent Nouvelles nouvelles*, a sort of imitation of the *Decameron*, and of the *Rosier des Guerres*, a book of instruction for his son. He also materially advanced the civilization of France by encouraging manufactures, commerce, and mining. He improved the public roads and canals, established several printing-presses, and founded three universities.

LOUIS XII., b. 1462, King of France, succeeding Charles VIII.; son of duke Charles of Orleans, and a descendant of Valentina Visconti. He reigned 1498–1515. In 1500, by virtue of his descent, he laid claim to Milan, conquered it, and took Ludovico Sforza prisoner. By the aid of Ferdinand of Aragon he conquered Naples too, but the allies quarreled over the partition of their conquest, and in 1503 Gonsalvo de Cordova expelled the French from southern Italy. In 1508 pope Julius II. formed the league of Cambray against the republic of Venice, being joined by Ferdinand of Aragon, Louis XII., and the emperor of Germany; but Venice having conciliated the pope by concessions, the

league was dissolved, and a new one, called the "holy league," was formed between the pope, the emperor, Venice, Ferdinand of Aragon, and Henry VIII. of England against France, and in 1513 the French were expelled from Italy.

LOUIS XIII., King of France, son of Henri IV. and Marie de' Medici, b. at Fontainebleau, Sept. 27, 1601, succeeded to the throne on the death of his father, May 14, 1610, his mother becoming regent. She entered into close alliance with Spain, and betrothed the king to Anne of Austria, daughter of Philip III. of Spain, upon which the Huguenots, becoming apprehensive of danger, took up arms; but peace was concluded at St. Menehould on May 5, 1614; and the king, who was now declared of age, confirmed the edict of Nantes, and called an assembly of the states, which was soon dismissed because it began to look too closely into financial affairs. See MARIE DE' MEDICI. The suppression of Protestantism and liberty in Bearn led to the religious war in which the Protestants lost almost all their places of security, and which ended in 1622. After the death of De Luynes, in 1624, Richelieu, afterwards cardinal and duke, became the chief minister of Louis. His powerful mind obtained complete control over that of the weak king, and his policy effected that increase of monarchical power, at the expense of Protestants, nobles, and parliaments, which reached its consummation in the reign of Louis XIV. The overthrow of the Huguenots was completed by the capture of Rochelle, Oct. 20, 1628, at the siege of which the king took part in person. In 1631 his brother, the duke of Orleans, having left the court, assembled a troop of Spaniards in the Netherlands, and entered France to compel the dismissal of Richelieu, whom he hated, and whom the king also secretly disliked; but the duke was completely defeated by marshal Schomberg at Castelnaudary. Richelieu now led Louis to take part in the thirty years' war, openly supporting Gustavus Adolphus and the Dutch against the Spaniards and Austrians. The latter years of Louis' reign were signalized by the getting possession of Alsace and of Roussillon, acquisitions which were confirmed in the following reign. Louis died May 14, 1643. His queen, after 23 years of married life, bore a son in 1638, who succeeded to the throne as Louis XIV.; and in 1640, a second son, Philip, duke of Orleans, the ancestor of the present house of Orleans.

LOUIS XIV., King of France, b. at St. Germain-en-Laye, Sept. 16, 1638, succeeded his father, Louis XIII., in 1643. His mother, Anne of Austria, became regent, and Mazarin (q.v.) her minister. During the king's minority, the discontented nobles, encouraged by Spain, sought to shake off the authority of the crown, and the civil wars of the *Fronde* (q.v.) arose. Peace was concluded in 1659; and in the following year Louis married the Infanta Maria Theresa, a princess possessing neither beauty nor other attractive qualities. Little was expected from the young king; his education had been neglected, and his conduct was dissolute; but on Mazarin's death, in 1661, he suddenly assumed the reins of government, and from that time forth carried into effect with rare energy a political theory of pure despotism. His famous saying, "*L'état c'est moi*" (I am the state), expressed the principle to which everything was accommodated. He had a cool and clear head, with much dignity and amenity of manners, great activity, and indomitable perseverance. The distress caused by the religious wars had created throughout France a longing for repose, which was favorable to his assumption of absolute power. He was ably supported by his ministers. Manufactures began to flourish under the royal protection. The fine cloths of Louviers, Abbeville, and Sedan, the tapestries of the Gobelins, the carpets of La Savonnerie, and the silks of Tours and Lyons acquired a wide celebrity. The wonderful talents of Colbert (q.v.) restored prosperity to the ruined finances of the country, and provided the means for war; whilst Louvois (q.v.) applied these means in raising and sending to the field armies more thoroughly equipped and disciplined than any other of that age.

On the death of Philip IV. of Spain, Louis, as his son-in-law, set up a claim to part of the Spanish Netherlands; and in 1667, accompanied by Turenne (q.v.), he crossed the frontier with a powerful army, took many places, and made himself master of that part of Flanders since known as French Flanders, and of the whole of Franche Comté. The *triple alliance*—between England, the States-general, and Sweden—arrested his career of conquest. The treaty of Aix-la-Chapelle (1668) forced him to surrender Franche Comté. He vowed revenge against the States-general, strengthened himself by German alliances, and purchased with money the friendship of Charles II. of England. He seized Lorraine in 1670; and in May, 1672, again entered the Netherlands with Condé and Turenne, conquered half the country in six weeks, and left the duke of Luxembourg to lay it waste. The States-general formed an alliance with Spain and with the emperor, but Louis made himself master of ten cities of the empire in Alsace; and in the spring of 1674 took the field with three great armies, of which he commanded one in person, Condé another, and Turenne a third. Victory attended his arms; and notwithstanding the death of Turenne, and the retirement of the prince of Condé from active service, he continued in subsequent years, along with his brother, the duke of Orleans, to extend his conquests in the Netherlands, where, by his orders, and according to the ruthless policy of Louvois, the country was fearfully desolated. The peace of Nimeguen, in 1678, left him possession of many of his conquests. He now established *chambres de réunion* in Metz, Breisach, and Besançon, pretended courts of law, in which his own will was supreme, and which confiscated to

him, as feudal superior in right of his conquests, territories which he wished to acquire, seignories belonging to the elector Palatine, the elector of Treves, and others. He also, on Sept. 30, 1681, made a sudden and successful attack on Strasburg, a free German city, the possession and fortification of which added greatly to his power on the Rhine. The acquisition thus made, a treaty in 1684 confirmed to him.

Louis had now reached the zenith of his career. All Europe feared him; his own nation had been brought by tyranny, skillful management, and military glory, to regard him with Asiatic humility, admiring and obeying; all remnants of political independence had been swept away; no assemblies of the states or of the notables were held; the nobles had lost both the desire and the ability to assert political power; the municipal corporations no longer exercised any right of election, but received appointments of officials from the court; the provinces were governed by *intendants*, who were immediately responsible to the ministers, and they to the king, who was his own prime minister. Even the courts of justice yielded to the absolute sway of the monarch, who interfered at pleasure with the ordinary course of law, by the appointment of commissions, or withdrew offenders from the jurisdiction of the courts by *lettres de cachet* (q.v.), of which he issued about 9,000 in the course of his reign. He asserted a right to dispose at his pleasure of all properties within the boundaries of his realm, and took credit to himself for gracious moderation in exercising it sparingly. The court was the very heart of the political and national life of France, and there the utmost splendor was maintained; and a system of etiquette was established, which was a sort of perpetual worship of the king.

It was a serious thing for France and the world when Louis fell under the control of his mistress, the marquise de Maintenon (q.v.), whom he married in a half-private manner in 1685, and who was herself governed by the Jesuits. One of the first effects of this change was the adoption of severe measures against the Protestants. When it was reported to Louis that his troops had converted all the heretics, he revoked the edict of Nantes in 1685, and then ensued a bloody persecution; whilst more than half a million of the best and most industrious of the inhabitants of France fled, carrying their skill and industry to other lands. Yet Louis was by no means willing to yield too much power to the pope; and quarreling with him concerning the revenues of vacant bishoprics, he convened a council of French clergy, which declared the papal power to extend only to matters of faith, and even in these to be dependent upon the decrees of councils.

The elector of the Palatinate having died in May, 1685, and left his sister, the duchess of Orleans, heiress of his movable property, Louis claimed for her also all the allodial lands; and from this and other causes arose a new European war. A French army invaded the Palatinate, Baden, Würtemberg, and Treves in 1688. In 1689 the lower Palatinate and neighboring regions were laid waste by fire and sword. This atrocious proceeding led to a new coalition against France. Success for a time attended the French arms, particularly in Savoy and at the battle of Steinkerk. Reverses, however, ensued: the war was waged for years on a great scale, and with various success: and after the French, under Luxembourg, had gained, in 1693, the battle of Neerwinden, it was found that the means of waging war were very much exhausted, and Louis concluded the peace of Ryswick, Sept. 20, 1697. The navy destroyed, the finances grievously embarrassed, the people suffering from want of food, and discontentment deep and general, Louis placed the count D'Argenson at the head of the police, and established an unparalleled system of espionage for the maintenance of his own despotism. The power of Mme. de Maintenon and her clerical advisers became more and more absolute at the court, where scandals of every kind increased.

When the death of Charles II. of Spain took place, Nov. 1, 1700, it was found that Louis had obtained his signature to a will by which he left all his dominions to one of the grandsons of his sister, who had been Louis's queen. Louis supported to the utmost the claim of his grandson (Philip V.), whilst the emperor Leopold supported that of his son, afterwards the emperor Charles VI. But the power of France was now weakened, and the war had to be maintained both on the side of the Netherlands and of Italy. One bloody defeat followed another; Marlborough was victorious in the Low Countries, and prince Eugene in Italy; whilst the forces of Louis were divided and weakened by the employment of large bodies of troops against the Camisards in the Cevennes, for the extinction of the last relics of Protestantism. On April 11, 1713, peace was concluded at Utrecht, the French prince obtaining the Spanish throne, but France sacrificing valuable colonies. A terrible fermentation now prevailed in France, and the country was almost completely ruined; but the monarch maintained to the last an unbending despotism. He died, after a short illness, Sept. 1, 1715. He was succeeded by his great grandson, Louis XV. His son, the dauphin, and his eldest grandson, the duke of Bretagne, had both died in 1711. Louis had a number of natural children, and he had legitimized those of whom Mme. de Montespan was the mother; but the parliament, which made no objection to recording the edict when required by him, made as little objection to annulling it when required by the next government. The "works" of Louis XIV. (6 vols. Paris, 1806), containing his instructions for his sons, and many letters, afford important information as to his character and the history of his reign. The reign of Louis XIV. is regarded as the Augustan age of French literature and art.

and it can hardly be doubted that France has never since produced poets like Corneille and Racine in tragedy, or Molière in comedy; satirists like Boileau, or divines like Bossuet, Fenelon, Bourdaloue, and Massillon.

LOUIS XV., King of France, the great-grandson of Louis XIV., b. at Versailles, Feb. 15, 1710, succeeded to the throne Sept. 1, 1715. The duke of Orleans, as first prince of the blood, was regent during the minority of the king, whose education was intrusted to marshal Villeroi and cardinal Fleury. The country was brought to the verge of ruin during the regency, by the folly of the regent and the financial schemes of the celebrated Scotchman, Law (q.v.). When Louis was 15 years of age he married Maria Lesczynski, daughter of Stanislas, the dethroned king of Poland. Fleury was for a long time at the head of affairs, and by parsimony succeeded in improving the condition of the finances. It was his policy also to avoid war, in which, however, Louis was involved in 1733, in support of his father-in-law's claim to the throne of Poland; the result being that Louis obtained Lorraine for his father-in-law, and ultimately for France. Notwithstanding the vigor with which this war was conducted, the character of Louis now became completely developed as one of the utmost sensuality, selfishness, and baseness. He surrounded himself with the vilest society, utterly forsook his queen, and lived, as he continued to do to the end of his life, in extreme debauchery, such as has rendered his name a proverb. In 1740 the war of the Austrian succession broke out, in which the French army was by no means very successful, and during which Fleury died. The king was present, in 1745, at the great victory of Fontenoy, and showed plenty of courage. In the preceding year, during a dangerous illness, he had made vows of reforming his life, and dismissed his mistresses: but on recovering health, he presently relapsed into vice. The peace of Aix-la-Chapelle, in 1748, was very much due to the entreaties of Mme. de Pompadour, whose influence the empress Elizabeth of Russia secured by bribes and flatteries. France gained nothing by this war; but her people were ruined, and her navy destroyed.

The king now sank completely under the control of Mme. de Pompadour, who was both concubine and procuress, and to whom he gave notes on the treasury for enormous sums, amounting in all to hundreds of millions of livres. War broke out again with Britain concerning the boundaries of Acadia (Nova Scotia), and was for some time prosecuted with considerable vigor. In 1756 an extraordinary alliance was formed between France and Austria, contrary to the policy of ages, and chiefly through the influence of Mme. de Pompadour; but as she disposed of the command of the French armies at her pleasure, success did not attend their operations. The state of the finances, the dispirited condition of the army, and the outcry of the distressed people were not sufficient to induce the king to make peace; but governed by his mistress, he obstinately persevered in war, even after the terrible defeat of Minden in 1759; whilst the British conquered almost all the French colonies both in the East and West Indies, with cape Breton and Canada. A peace, most humiliating to France, was at last concluded in 1763.

Louis, although indifferent to the ruin of his people, and to everything but his own vile pleasures, was reluctantly compelled to take part in the contest between Mme. de Pompadour and the Jesuits, the result of which was the suppression of the order in 1764. See JESUITS. The parliaments, emboldened by their success in this contest, now attempted to limit the power of the crown, by refusing to register edicts of taxation; but the king acted with unusual vigor, maintaining his own absolute and supreme authority, and treating the attempt of the parliaments to unite for one object as rebellious. The duke of Choiseul was now displaced from office; a new mistress, Mme. Du Barry, having now come into the place of Mme. de Pompadour; and a ministry was formed under the duke d'Aiguillon, every member of which was an enemy of the parliaments, and an object of popular detestation. The councilors of the parliament of Paris were removed from their offices, and banished with great indignity; and an interim parliament was appointed (Jan., 1771), which duly obeyed the court. The princes of the blood protested against this arbitrary act, which deeply moved the popular indignation. The king, when told of the ruin of the country, and the misery and discontent of the people, only remarked that the monarchy would last as long as his life; and continued immersed in sensual pleasures and trifling amusements. He boasted of being the best cook in France, and was much gratified when the courtiers ate eagerly of the dishes which he had prepared. His gifts to Mme. Du Barry, notwithstanding the embarrassment of the finances, in five years amounted to 180,000,000 of livres. At last, Louis, who had for some time suffered from a disease contracted through vice, was seized with small-pox, the infection of which was communicated by a young girl who had been brought to him, and on May 10, 1774, he died, so far from being regretted that his funeral was a sort of popular festival, and was celebrated with pasquils and merry ballads. His death-bed was one of extreme misery. He was succeeded by his grandson, Louis XVI.

LOUIS XVI., AUGUSTE, king of France, b. Aug. 23, 1754, was the third son of the dauphin, Louis, only son of Louis XV. He was styled duke de Berry, until, by the death of his father and his elder brothers, he became dauphin. He had a vigorous frame, was fond of hunting and manly exercises, took great pleasure in mechanical labors, and showed an aptitude for geometry, but none for political science. In the

midst of the most corrupt of courts, he grew up temperate, honest, and moral. He was married on May 10, 1770, to Marie Antoinette, the youngest daughter of the empress Maria Theresa.

When Louis ascended the throne, misery and discontent prevailed throughout France. He had not the vigor and judgment necessary for circumstances full of difficulty, and was conscious of his own weakness. He made Maurepas, an old courtier, his prime minister; but among his ministers were Malesherbes, Turgot, and other men of known patriotism; and his accession was signalized by the remission of some of the odious taxes, the abolition of the last relics of serfdom, the abolition of the torture in judicial investigations, a reduction of the expenditure of the court, and the foundation of institutions for the benefit of the working-classes. He was, for a time, extremely popular; but deeper reforms were rendered impossible by the opposition of the privileged classes. In June, 1777, when the state of the finances seemed nearly desperate, Necker (q.v.) was called to the office of general director of them, and succeeded in bringing them to a more tolerable condition, without any very radical change; but from the interference of France in the American war of independence, he was obliged to propose the taxation of the privileged classes, hitherto exempted. Their resistance compelled him to resign; and Joly de Fleury succeeded him; but the general discontentment induced the king, in 1783, to appoint Calonne (q.v.) comptroller-general, who found money for a time by borrowing, much to the satisfaction of the courtiers. But the indignation of the people increasing, Calonne found it necessary to recommend the convening of an assembly of the notables. On May 1, 1787, the archbishop Loménie de Brienne became finance minister. He obtained from the notables some concessions and some new taxes. But the parliament of Paris refused to register the edict of taxation, as oppressive to the people; and the extravagance of the court and the queen began to be freely spoken of. The convening of the states-general now began to be demanded from every corner of France. The king registered the edicts in a *lit de justice*, and banished the councilors of parliament to Troyes; but ere long found it necessary to recall them, and experienced from them even a stronger opposition than before. On May 8, 1788, he dissolved all the parliaments, and established a new kind of court (*cour plénière*) instead; but this act of despotism set the whole country in flames. Matters became still worse, when on Aug. 16, appeared the famous edict, that the treasury should cease from all cash payments except to the troops. Brienne was compelled to resign, and Necker again became minister. An assembly of the states of the kingdom was resolved upon; and by the advice of Necker, who wished a counterpoise to the influence of the nobility, clergy, and court, the third estate was called in double number.

The subsequent history of Louis is given at length under the head FRANCE. All readers of history are familiar with the melancholy incidents of his life, from the opening of the assembly of the states (May 5, 1789), down to his tragic execution. At 10 o'clock in the morning of Jan. 21, 1793, he died by the guillotine, in the Place de la Révolution. Great precautions were taken to prevent any rescue. As the executioner bound him, Louis tore himself free, and exclaimed: "Frenchmen, I die innocent; I pray that my blood come not upon France." The rolling of drums drowned his voice. Ere the guillotine fell, the abbé Edgeworth, his confessor, cheered him with the words: "Son of St. Louis, ascend to heaven!"

LOUIS XVII., CHARLES, second son of Louis XVI. of France, b. at Versailles, Mar. 27, 1785, received the title of duke of Normandy, till, on the death of his brother in 1789, he became dauphin. He was a promising boy. In the earlier days of the revolution he was sometimes dressed in the uniform of the national guard, and decorated with the tricolor, to gratify the populace. After the death of his father he continued in prison —at first with his mother, but afterwards apart from her—in the temple, under the charge of a coarse Jacobin shoemaker named Simon, who treated him with great cruelty, and led him into vicious excesses, so that he became a mere wreck both in mind and body. After the overthrow of the terrorists he was—perhaps intentionally—forgotten, and died June 8, 1795. A report spread that he was poisoned, but a commission of physicians examined the body and declared the report unfounded.

LOUIS XVIII., STANISLAS XAVIER, the next younger brother of Louis XVI., b. at Versailles, Nov. 17, 1755, received the title of count de Provence. In 1771 he married Maria Josephine Louisa, daughter of Victor Amadeus III. of Sardinia. After the accession of Louis XVI. to the throne he assumed the designation of *monsieur*, and became an opponent of every salutary measure of the government. He fled from Paris on the same night with the king, and was more fortunate, for, taking the road by Lille, he reached the Belgian frontier in safety. With his brother, the count d'Artais, he now issued declarations against the revolutionary cause in France, which had a very unfavorable effect on the situation of the king. The two brothers for some time held a sort of court at Coblentz. Louis joined the body of 6,000 emigrants who accompanied the Prussians across the Rhine in July, 1792, and issued a manifesto even more foolish and extravagant than that of the duke of Brunswick. After the death of his brother, Louis XVI., he proclaimed his nephew king of France, as Louis XVII., and in 1795 himself assumed the title of king. The events of subsequent years compelled him frequently to change his place of abode, removing from one country of Europe to another, till at last,

in 1807, he found a refuge in England, and purchased a residence, Hartwell, in Buckinghamshire, where his wife died in 1810, and where he remained till the fall of Napoleon opened the way for him to the French throne. He landed at Calais on April 26, 1814, and entered Paris, after 24 years' exile, on May 3; and the nation received the constitutional charter from his hands on June 4. See FRANCE.

The conduct of the government, however, was far from being constitutional or liberal. The nobles and priests exercised an influence over the weak king which led to severe treatment of the imperialists, the republicans, and the Protestants. Then followed Napoleon's return from Elba, when the king and his family fled from Paris, remained at Ghent till after the battle of Waterloo, and returned to France under protection of the duke of Wellington. He issued from Cambrai a proclamation in which he acknowledged his former errors, and promised a general amnesty to all except traitors. Again, however, he followed in many things the counsels of the party which detested all the fruits of the revolution. But the chamber of deputies, elected with many irregularities, was fanatically royalist, and the king, by advice of the duke de Richelieu, dissolved it; whereupon arose royalist plots for his dethronement, and the abolition of the charter. Bands of assassins were collected by nobles and priests in the provinces, who slew hundreds of adherents of the revolution and of Protestants, and years elapsed ere peace and good order were in any measure restored. Louis died Sept. 16, 1824.

LOUIS (properly **LUDWIG**) **THE GERMAN**, the third son of Louis le débonnaire, was b. about 805, and by the treaty at Verdun, in 843, Louis obtained Germany, and became the founder of a distinct German monarchy. He died at Frankfort, Aug. 28, 876. His kingdom was divided amongst his three sons: Carlmann obtaining Bavaria, Carinthia, and the tributary Slavonic countries; Louis obtaining Franconia, Thuringia, Saxony, and Friesland; Charles the fat obtaining Swabia, from the Main to the Alps. See CARLOVINGIANS.

LOUIS THE GREAT, King of Hungary. See HUNGARY, *ante*.

LOUIS II., Roman Emperor (see CARLOVINGIANS, *ante*), 822–75; the oldest son of Lothaire I., and reigned 855–75. By the treaty of Verdun, the empire, after the death of Louis le débonnaire, was divided between his three sons, Lothaire I., Louis the German, and Charles the bald. Italy was assigned to Louis II., who took the title of emperor; Charles took Provence and Lyons; and Lothaire II. the region called Lotharingia, or Lorraine. Louis II. defeated the Saracens at Benevento in 848, and expelled them from Bari. He established his authority over the great families of Italy, many of whom conspired with the Byzantine empire. Charles having died without children in 863, his brothers, Louis II. and Lothaire II., divided his dominions between them. Lothaire II., six years later, also died without issue, when Charles the bald and Louis the German seized and divided his dominions. Louis II. d. at Brescia, leaving no male issue, whereupon his two uncles seized his dominions, the province of Lorraine falling to Germany.

LOUIS III., THE CHILD, Roman Emperor (see CARLOVINGIANS, *ante*), 893–911; raised to the throne of Germany on the death of his father, Arnulf in 899 by duke Otto of Saxe, margrave Luitpold of Austria, and archbishop Hatto of Mentz, it being their desire to govern the country during his minority. Germany was in a wretched condition under their rule, and the Hungarians seized this opportunity and devastated it as far as Thuringia. In the death of Louis III., who reigned 908–11, the Carlovingian dynasty was extinguished in Germany.

LOUIS, PIERRE CHARLES ALEXANDRE, 1787–1872; b. in the department of Marne, France; graduated in medicine at Paris 1813, and afterwards entered the *hôpital de la charité*, and pursued the study of pathological anatomy. In 1825 he published *Recherches Anatomico-pathologiques sur la Phthisie;* and in 1826 *Recherches sur la Membrane Muqueuse de l'Estomac*, of which a second edition was published in 1843. These works gained him admission to the academy of medicine. In 1828 he was one of the commission sent to Gibraltar to investigate yellow fever. There also appeared in 1828 his *Recherches sur la Fièvre Typhoïde*, republished in 1841; *Examen de l'Examen de Broussais*, in 1834; and in 1835 *Recherches sur la Effets de la Saignée dans Quelques Maladies Inflammatoires.* He retired from practice in 1854, having won a great reputation as a medical scientist. He was one of the most prominent in the profession to advocate the importance of statistics in medical investigations. He died in Paris.

LOUISA, a s.e. co. of Iowa, 400 sq.m.; pop. '80, 13,146; traversed by the Burlington, Cedar Rapids and Minnesota railroad, and watered by the Iowa river. The surface is level, and the soil fertile, broad bottom lands occurring at intervals. The most important productions are cattle, grain, and wool. Co. seat, Wapello.

LOUISA, an e. central co. of Virginia, 460 sq.m.; pop. '80, 18,941. The surface is irregular, the soil productive, tobacco and grain being the staples. There are no important manufactures except flour. The Chesapeake and Ohio railroad intersects this county. Co. seat, Louisa Court-House.

LOUISA (LUISE AUGUSTE WILHELMINE AMALIE), Queen of Prussia. See LUISE, *ante*.

LOUISA ULRICA, 1720–82, Queen of Sweden; sister of Frederic the great; b. in Berlin; married in 1744 the crown-prince Adolphus Frederick of Sweden, afterwards king. She was a woman of rare intelligence. Through her influence the great botanist Linnæus was enabled to publish his system. The academy of belles-lettres and history and the musuem at Stockholm, as well as a library and art-museum at Drottingholm, were founded through her influence. She was mother of Gustavus III. and Charles XIII.

LOUISBURG, a t. in s.e. Nova Scotia, on the Atlantic coast, at the mouth of a small estuary; is the terminus of a railroad 30 m. in length from Sydney across the co. of Cape Breton. It had formerly a finely built stone fortress, mounting 65 cannon and 16 mortars, erected by emigrants from the French settlements after the peace of Utrecht in 1713, and named in honor of Louis XIV. The harbor was defended by a high wall and a ditch 80 ft. wide, a battery of 30 guns on Goat island, and another, the "royal battery," farther down the harbor, mounting 30 guns. These fortifications, built in 30 years and costing $5,550,000, were destroyed by the British in less than three months at an expense of $50,000. In 1745 the legislature of Massachusetts Bay, on account of the danger menacing its fisheries from the proximity of a fortified town belonging to the French and the shelter given to the privateers of a country with which they were at war, by the advice of gov. Shirley and a majority of one vote in a secret session, sent a force of 3,250 men of the state militia, under command of William Pepperell, with 516 men of Connecticut and 304 of New Hampshire, with a fleet of 100 New England vessels and a squadron under the British commodore Warren, against the town, which landed in its vicinity April 30. The siege ended June 17, 1745, by the surrender of 1600 Frenchmen under Duchambon. The English also captured a large ship in the harbor coming with reinforcements for the French; and on their triumphant entrance to the town the same drums were beaten that, 30 years afterward, were beaten at Bunker Hill. In 1748 the place came again under French rule as one of the results of the peace of Aix-la-Chapelle. In 1757 6,000 regulars, 4,000 men from New England, and others from New York and New Jersey, were ordered to report at Halifax for the purpose of making an attack on Louisburg, but were disheartened by the prospect of a well-garrisoned fort and 17 French ships of war moored in the harbor, and discreetly withdrew. In 1758 the town was bombarded by 14,000 British troops under gen. Amherst, with a fleet including 20 ships of the line, 18 frigates, and some smaller vessels, sailing from Halifax. The surrender of the French garrison of 3,100 men, under the chevalier de Drucourt, and a fleet of 8 ships, occurred July 26, 1758; and 5,637 soldiers and sailors were taken prisoners. It had formerly a pop. of 3,000 in a well-built town on the s. side of the harbor, and had a large trade in codfish, exporting annually 500,000 quintals, employing (while under French dominion) for this and other branches of trade, and in the fisheries, 600 vessels. Under English government its trade has diminished, and a convenient harbor, one-half mile wide at the entrance, is used simply as a stopping-place for steamships. It is occupied by about 300 fishermen, and has a light-house on the e. side of the harbor.

LOUIS-D'OR (i.e., *golden Louis*), a gold coin which was introduced into France in 1641, and continued to be coined till 1795. It was introduced in consequence of the prevalent custom of clipping and otherwise defacing the then coins of the realm, from which malpractices it was thought to be in some measure secured by its border. The old coins were called in. The louis-d'or ranged in value from about 16s. 7d. to 18s. 9¾d. sterling. Some louis-d'ors bear special names, chiefly derived from the figure exhibited on the obverse side.—In some parts of Germany, the larger gold pieces, of five thalers or thereby, are often popularly called *louis-d'or*, and the name is also occasionally applied to the French *napoleon or 20-franc piece.*

LOUISIA'NA, one of the United States of America, bounded on the s. by the gulf of Mexico, and on the w. by the state of Texas. It is 290 m. from e. to w., and 200 from n. to s., having an area of 41,346 sq.m., or 26,461,440 acres. The principal rivers are the Mississippi—which has a course of 800 m. in this state, and whose delta traverses its southern half—Red river and the Washita, and their branches. The principal towns are New Orleans (the capital) and Baton Rouge, on the Mississippi. The coast line, a portion of the shore of the gulf of Mexico, is 1256 m. in length. The surface is flat, rising nowhere more than 200 ft., and of alluvial formation. A large portion of the state is below the high-water level of the rivers, and is protected by dikes, called *levées*, from inundations. The land is generally of great richness, producing sugar-cane, cotton, rice, maize, tobacco, oranges, bananas, figs, peaches, etc. In the forests are several kinds of oak, hickory, locust, sassafras, mulberry, etc. In 1860 Louisiana produced 221,776 hogsheads of sugar and 13,439,772 gallons of molasses; in 1870 these figures had fallen to 80,706 and 4,585,150; in 1877 the produce of sugar was 127,753 hogsheads. Louisiana ranks fifth among the cotton-raising states. In 1879 the public debt was $11,724,800, funded. There are 6 colleges in Louisiana, near 1000 schools, numerous public libraries, and in 1878, 89 periodicals. Louisiana was settled by the French in 1699; in 1716 it was granted to John Law, who based upon his grant the famous Mississippi company; ceded to Spain in 1762; re-ceded to Napoleon I. in 1800; purchased in 1803 by the United States for $15,000,000; and admitted as a state in 1812. Invaded by the British troops in 1814 under gen. Packenham, New Orleans was success-

fully defended by gen. Jackson. The population, mostly Creoles, was, in 1870, 710,304; in 1875, 857,039.

LOUISIANA (*ante*). In 1541 De Soto visited and explored the region around New Orleans, and, dying in the following year, was buried in the waters of the Mississippi. In 1673 father Marquette and his Canadian followers descended the river to its mouth, but founded no settlement. In 1682 La Salle descended the river and took possession of the country in the name of Louis XIV., in whose honor he named it Louisiana. It is believed, however, that no colony was founded before Iberville in 1699, with a number of colonists, settled in Biloxi, now in Alabama. Iberville, dying soon afterwards, was succeeded by Bienville, who, after he and his colonists had endured great privations, led them to the present site of New Orleans in 1706, where they made a stand and unfurled the flag of France. The colony languished, but the colonists did not abandon their post. In 1712 Louis XIV. gave to Anthony Crozat, a Paris merchant, the exclusive privilege for 15 years of trading in all this vast region, of sending a ship once a year to Africa for a cargo of slaves, and of working the mines, one-fourth of the products of which Crozat agreed to pay over to the king. In 1717 he relinquished the colony as unprofitable, and the province fell into the hands of John Law, the great speculator, who soon came to financial disaster, and was followed by Bienville, who built up the town of New Orleans, which was made the capital of the colony in 1723. The affairs of the new settlement remained under the direction of the French crown until 1762, when the province was secretly transferred to Spain, which ruled it with a rod of iron for 38 years, when in 1800 it was restored to France. Three years later it was sold to the United States for $15,000,000. At that time it embraced nearly all of the present states of Louisiana, Arkansas, Missouri, Iowa, Minnesota, Dakotah territory, most of Kansas and the Indian territory, part of Colorado, most of Wyoming, and the whole of Montana, Idaho, Oregon, and Washington territory. In 1804 the southern portion of this vast region was organized by congress as the territory of Orleans. In 1810 another part of the state, lying between the Mississippi and the Amity and Pearl rivers, was annexed to Orleans; and in April, 1812, the territory as thus constituted was admitted to the union as a state, with the name of Louisiana. Three months after this the United States declared war against Great Britain. The war continued a little over two years, the treaty of peace being signed at Ghent, Dec. 24, 1814. Before news of the peace could cross the ocean a British force of 12,000 men, led by sir John Packenham, landed on the coast of Louisiana and made an attack upon New Orleans, which was successfully resisted by gen. Jackson with only 5,000 men, mostly militia from Tennessee and Kentucky. The progress of the state after this was rapid.

The surface of Louisiana is mostly low and level, much of the southern part especially being not more than 10 ft. above the sea-level and liable to frequent inundations from the rivers. The delta of the Mississippi is full of swamps, and the coast is lined with salt marshes. The land along the Mississippi below New Orleans and 120 m. above is below the surface of the river at high water, and protected from inundation by artificial embankments called levees. A breach in a levee, called in the language of the country a crevasse, sometimes occurs, inundating hundreds of thousands of acres of valuable land and destroying the growing crops. The northern and western part of the state is somewhat broken by low hills, nowhere rising above 200 feet. The river bottoms are exceedingly fertile, and the alluvial land is easily drained. The latter is heavily timbered, and covered with a thick undergrowth of cane. The prairies are better fitted for grazing than for culture. The hilly portion of the state consists mainly of pine barrens, on which are found oak, elm, cypress, honey-locust, and other timber. Among the forest trees of the state are the ash, walnut, hickory, poplar, mulberry, magnolia, cotton-wood, maple, buckeye, willow, paw paw, pecan, dogwood, and persimmon. The wild cane sometimes grows to a height of 30 feet. Among the fruit trees are the quince, plum, peach, fig, orange, lemon, and lime. The orange grows only in the southern, the apple only in the northern, section. The chief agricultural staples are cotton, sugar, rice, and corn. The rice and sugar plantations are found only in the southern part of the state, below lat. 30°, upon the alluvial lands along the Mississippi. Nearly all the sugar made in the United States is produced here. It is a somewhat uncertain crop. The mineral productions of the state are unimportant. Rock salt of unknown depth is found at Petit Anse upon an area of more than 140 acres, and in Calcasieu parish are deposits of gypsum and sulphur. There are salt wells in Bienville, Natchitoches, and Winn parishes.

The climate of s.e. Louisiana is to some extent malarious; but the northern and western sections are healthful, and much visited by consumptives, who are generally benefited by a residence there. By careful attention to sanitary laws New Orleans has become far more healthful than it formerly was. Owing to the prevalence of northern winds, the winter months in Louisiana are more severe than in other regions of a corresponding latitude. The summers are long and hot. The mean annual temperature at New Orleans is about 67°; that of the warmest month, 82°; of the coldest, 46°. The Mississippi, one of the largest rivers in the world, has a course of nearly 600 m. in the state.

The Red river enters the n.e. corner of the state from Arkansas and flows in a s.e.

direction till it reaches the Mississippi some 40 m. below Natchez. Near its mouth it receives the Washita, which also enters the state from Arkansas and flows almost due-south. Its other affluents are the Dugdemona, the Sabine bayou, and the Bastineau river and lake. The Sabine river forms in part the western boundary of the state. The Pearl, the Tangipahoa, Tickfaw, and Amite are the principal streams e. of the Mississippi. There are besides several large bayous and estuaries, which are but secondary mouths of the Mississippi. The chief of these are the Atchafalaya, with its series of lakes, the Vermillion, the bayou Teche, bayou de Large, and bayou la Fourche. Lakes Pontchartrain, Borgne, Maurepas, Sabine, Calcasieu, Mermenteau, Grand, Marsh, Charles, Grand Chenière, Callou, etc., are all estuaries, their waters being salt from communication with the gulf of Mexico, and connected with rivers or bayous. The islands off the coast produce sea-island cotton of the finest quality.

The wild animals of the state are the black bear, wolf, panther, wild-cat, raccoon, otter, polecat, opossum, squirrel, etc.; the alligator inhabits the bayous. Among the reptiles are the rattlesnake, horned-frog, lizard, viper, moccasin snake, etc. Among the birds are the gray and bald eagle, the king vulture, the turkey buzzard, hawk, owl, gull, pelican, crane, heron, wild-turkey, wild-goose, pigeon, wild-duck, etc.

The number of acres of improved farm land in 1870 was 2,045,640; cash value of farms, $68,215,420; estimated value of all farm products, $52,006,622. The value of farm implements and machinery in 1870 was $7,159,333; wages paid during the year, $11,042,789; value of orchard products, $142,129; of produce of market gardens, $176,969; wheat product, 9,906 bush.; corn, 7,596,628 bush.; sweet potatoes, 1,023,706 bush; rice, 15,854,012 lbs.; wool, 140,428 lbs.; cotton, 350,832 bales; milk sold, 833,928 galls.; cane molasses, 4,585,150 galls.; cane sugar, 80,706 hogsheads. The number of pounds of sugar raised in several successive years and the value thereof are thus stated: 1875-76 165,450,000 lbs., valued at $11,578,000; 1876-77, 194,964,000 lbs., valued at $15,646,000; 1877-78, 149,469,000 lbs., valued at $9,007,000. The product of molasses in 1877-78 was 13,576,374 galls. The rice crop of 1877 was 140,785 bbls.; that of 1877-78, 157,770 bbls. The orange crop is becoming important, but there are no accurate statistics of its increase. The cotton product of 1872 was 434,000 bales; that of 1877, 645,000 bales. The sugar crop of 1877 was 208,841 hogsheads. The manufactures of the state, aside from sugar, are not very extensive. In 1870 there were 2,557 establishments, including the sugar mills on the plantations; capital invested, $18,313,974; wages paid, $4,593,470; value of products, $24,161,905, of which sum $10,341,858 was credited to sugar alone. The other branches of manufacture were: lumber, bakery products, iron-castings, tobacco and cigars, clothing, flouring mill products, railroad cars, machinery, cotton-seed oil, ship-building, and malt liquors. Since 1870, 2 cotton factories and 5 sugar refineries have been established. The assessment of property for taxation in 1878-79 was estimated at $177,000,000.

In domestic and foreign exports, Louisiana ranks next to New York. Its exports of domestic products for the year ending June 30, 1874, were valued at $93,478,513. The imports of 1874 were estimated at $14,548,056. The value of inward-bound coastwise cargoes to New Orleans in 1872 was $160,000,000. The coastwise and foreign trade together amount probably to not less than $400,000,000 annually. In 1874, 2,928 vessels entered the ports of the state, having an aggregate tonnage of 1,640,676 tons, and being manned by 51,864 persons. In the same year 3,042 vessels cleared from the same ports, with an aggregate tonnage of 1,743,312 tons, and manned by 49,956 men. The domestic exports from New Orleans for the year ending June 30, 1879, were valued at $63,624,797; the imports for the same period amounted to $7,141,989. The increase in the depth of water at the mouths of the Mississippi, by means of jetties, has had a visible effect upon the commerce of New Orleans.

In 1873 there were in the state 8 national banks, with a capital of $4,150,000. Other banks, organized under state laws, had capitals amounting to about the same sum. There were also several savings banks and insurance companies. The pop. of the state in 1870 was 726,915, of whom 362,065 were white and 364,210 were colored. In 1874 the number of miles of completed railroad was 445, the chief lines being the Clinton and Port Hudson; the Baton Rouge, Gross Tête and Opelousas; the New Orleans, Jackson and Great Northern; the North Louisiana and Texas; the Texas and Pacific. Short canals connect the navigable waters around New Orleans.

The state institutions are the penitentiary at Baton Rouge, the insane asylum at Jackson, the charity hospital at New Orleans, and the institutions for the deaf and dumb and blind at Baton Rouge. The public debt of the state in 1878 amounted to $11,785,293. There was a failure to pay the interest falling due upon this debt Jan. 1, 1879.

The public school fund includes: 1, the sum of $1,130,867, the avails of lands granted by the United States for the support of free schools, on which the state pays an annual interest of 4 per cent; 2, proceeds of such taxation as the legislature may levy for the purpose; 3, any lands or other property bequeathed to the state for schools; 4, all property or funds, other than unimproved lands, bequeathed to the state and not designated for other purposes; 5, avails of lands escheated to the state. The constitution provides for the election of a superintendent of public education for a term of 4 years. Colored children are not allowed to attend the same schools with white children. According to

the report of the state superintendent for 1873 there were in the state 272,334 persons of school age; number of school districts, 483; of public schools, 864; teachers, 1296, of whom 685 were males and 611 females; average salary of teachers per month, $42.50; estimated value of school property, $661,962; average daily attendance in 34 parishes, 35,061. In 7 parishes no schools were reported. The number of private schools reported was 296, with 794 teachers and 21,434 pupils. The principal colleges of the state are the Louisiana state university; the New Orleans university (Methodist); St. Mary, Jefferson (Roman Catholic); Centenary (Methodist); Straight university (non-sectarian, but under Congregational auspices). The New Orleans and Straight universities are open to all, without distinction of race or sex. The Louisiana state agricultural and mechanical college was established in New Orleans in 1874. It is supported in part by the avails of the land received from congress for that purpose under the act of 1862. The legislature in 1880, in compliance with an express provision of the constitution, passed an act to establish in New Orleans a university for persons of color, to be known as "Southern university." The number of libraries reported in 1870 was 2,332, containing 847,406 volumes. There were at the same time 7 daily, 1 tri-weekly, 8 semi-weekly, and 75 weekly newspapers, about 20 of them being printed wholly or partly in French. The number of church organizations was 638, owning 599 edifices, valued at $4,048,145.

A new constitution, framed by a convention held for the purpose, was ratified by the people Dec. 8, 1879, by a vote of 86,494 in the affirmative to 27,346 in the negative. The governor is elected by the people for 4 years, and receives a salary of $4,000. The general assembly is composed of a senate and house of representatives; the former to consist of not more than 36 nor less than 24, and the latter of not more than 98 nor less than 70 members, to be elected for 4 years, and to receive $4 per day while engaged in the performance of their duties. The assembly meets biennially, and its sessions are limited to 60 days. The supreme court is composed of one chief-justice and three associate justices, appointed for 12 years by the governor, with the advice and consent of the senate; their salaries are $5,000 each, and the court, with some special exceptions, has only an appellate jurisdiction. The state is divided into 4 supreme court districts. The courts of appeal, one for each of five circuits, are each composed of two circuit judges, elected for 8 years by the two houses of the general assembly in joint session; salaries, $4,000. These courts have no other than an appellate jurisdiction. The district courts are each composed of a single judge elected by the people of the district for 4 years, and paid a salary of $3,000. These courts have a very wide jurisdiction, but their decisions are subject to review by the higher courts. The districts must be not more than 30 nor less than 20 in number, at the discretion of the legislature. Special courts are provided for the city of New Orleans. New Orleans is the seat of government. Lotteries may be authorized by the legislature until 1895, beyond which time they are absolutely prohibited. The legislature, however, in 1880, exercising the discretion which the constitution allows, passed an act of prohibition. Women over 21 years of age are eligible to any office of control or management under the school laws.

Louisiana was one of the first states to secede from the union, the ordinance of secession having been adopted in convention Dec. 23, 1860, by a vote of 117 to 113. The same convention adopted the confederate constitution and passed amendments to the state constitution conforming it thereto. The people had no opportunity to vote upon the question, except in electing delegates to the conventions. The new state government maintained a nominal existence until near the close of the rebellion, though most of the state, after the capture of New Orleans by admiral Farragut in April, 1862, was in possession of the union forces. The city was handed over to the army, and governed successively by gens. Butler and Banks. The latter, in 1863, made an excursion into the Attakapas region, along the bayou Teche, and succeeded in establishing there the authority of the United States. In the spring of 1864 he ascended the Red river with a large force, but was compelled to retreat after several disastrous battles. In April, 1864, a convention of a portion of the people of the state adopted a new constitution and sought readmission to the union, but congress denied the request. A second convention was held and another constitution adopted in 1868. This constitution was accepted by congress upon certain conditions, which were subsequently complied with; and on July 13, 1868, the government was relinquished by the military and handed over to the civil authorities. During the three years of military occupation which followed the rebellion, there were great political and social disturbances; and after the readmission of the state to the union there were for a time conflicts of authority of a most unpleasant and dangerous character. The electoral votes of Louisiana for president and vice-president of the United States have been cast as follows: 1812, 3 for Madison and Gerry; 1816, 3 for Monroe and Tompkins; 1820, 3 for Monroe and Tompkins; 1824, 3 for Jackson and 2 for Adams for president, and 5 for Calhoun for vice-president; 1828, 5 for Jackson and Calhoun; 1832, 5 for Jackson and Van Buren; 1836, 5 for Van Buren and R. M. Johnson; 1840, 5 for Harrison and Tyler; 1844, 5 for Polk and Dallas; 1848, 6 for Taylor and Fillmore; 1852, 6 for Pierce and King; 1856, 6 for Buchanan and Breckinridge; 1860 and 1864, no vote; 1868, 7 for Seymour and Blair; 1872, 8 not counted; 1876, 8 for Hayes and Wheeler.

LOUISIANA, a city of Missouri, in Pike co., on the Mississippi river, 115 m. above St. Louis, and on the Chicago and Alton railroad, which crosses the river at this point;

pop. 3,639; has 10 churches, 2 weekly newspapers, 1 college, 1 public library, a fine public school, public gas works, a paid fire department, 2 foundries, and several tobacco manufactories. It is the seat of an extensive lumber business, and the center of a fine fruit-growing region.

LOUIS NAPOLÉON, whose full name was CHARLES LOUIS NAPOLÉON BONAPARTE, and his titular designation, *Napoléon III., Emperor of the French*, was b. at Paris, in the palace of the Tuileries, April 20, 1808. He was the third son of Louis Bonaparte, brother of the first emperor. See BONAPARTE FAMILY. His birth was celebrated with great rejoicings throughout France, as that of an heir to the imperial throne, for by the law of succession (dated 28th Floreal, year 12, and 5th Frimaire, year 13), the crown, in default of direct descendants of the emperor himself—and he at that time had none—could be inherited only by the children of two of his brothers, Joseph and Louis. But Joseph was also childless, and the sons of Louis, in consequence, became heirs apparent. After the restoration of the Bourbons, the ex-queen Hortense, mother of Louis Napoleon, went into exile, carrying with her her two sons, Napoléon Louis and Louis Napoléon. Since 1810 she had been separated from her husband. Louis received his early education in the castle of Arenenberg, on the shores of lake Constance, where his mother resided. He was furnished with the best tutors that could be got, and was far from proving a slothful pupil. At the gymnasium of Augsburg, he displayed quite a passion for history and the exact sciences. His love of athletic sports was equally conspicuous: he was one of the best fencers, riders, and swimmers in the whole school. In Switzerland, his inclination and aptitude for military strategy, especially in artillery and engineering, was first developed. He even served for some time as a volunteer in the federal camp at Thun, and at a later period in his life wrote a *Manuel d'Artillerie* (Zürich, 1836). In 1830, when an insurrection broke out in the pontifical states, Louis Napoléon and his brother took part in it. The latter died at Forli, and Louis Napoléon himself fell dangerously ill at Ancona, and was only saved by the tender devotedness of his mother. The Austrian occupation of Ancona forced them to quit the city secretly; they proceeded to France, but their incognito being betrayed, they were expelled by Louis Philippe, after a few days, and crossed over to England, whence they soon retured to Switzerland. Such, however, was the charm of Napoléon's name that the chiefs of Polish insurrection offered him, in 1831, the command of their legions, "as the nephew of the greatest captain of all ages," and also the crown of Poland. The capture of Warsaw by the Russians, however, put a stop to further proceedings in this matter, and Louis Napoléon once more turned to his silent and somber studies. The death (July 22, 1832) of the duke of Reichstadt, sometimes called *Napoléon II.*, only son of the first emperor, opened the future to his ambitious hopes; and even his supporters admit that, from this date forward, his whole life, speculative and practical, was devoted to the realization of what now became his "fixed idea;" viz., that he was destined to be the sovereign of France. Between 1832 and 1836 he published several works, which not only kept him prominently before the French public, but evoked a considerable amount of political and intellectual sympathy. We may mention his *Rêveries Politiques; Projet de Constitution; Deux Mots à M. de Chateaubriand sur la Duchesse de Berri* (in verse); and *Considérations Politiques et Militaires sur la Suisse.* In 1836, believing in the instability of the throne of Louis Philippe, and in the general disaffection of the *bourgeoisie*, encouraged also by the proofs of vivid attachment to his person displayed by nearly the whole of the democratic party, but, above all, confiding in the grandeur of those memories which his name recalled, he, with a few associates, among whom was the comte de Persigny, since better known, made his famous attempt at a *coup d'état* at Strasbourg. It was, as the world knows, a ludicrous failure. Louis Napoléon was taken prisoner under humiliating circumstances, and after some days conveyed to Paris; but the government of Louis Philippe was afraid to bring a Bonaparte to trial—as in such a case it could not rely upon the impartiality of a French jury—and in consequence shipped him off to America. The illness of his mother soon caused him to return to Europe. He found her dying; two months later, he received her last sighs (Oct. 3, 1837). Although the affair of Strasbourg had naturally enough caused many people to doubt the talent and particularly the judgment of Louis Napoléon, still Louis Philippe, who was, politically speaking, an extremely timid monarch, dreaded some new conspiracy, and, in consequence, the French government demanded of Switzerland the expulsion of the obnoxious prince from its territories, M. Molé actually enjoining the French ambassador to request his passports in case of a refusal. Switzerland was violently agitated, and was almost on the point of going to war for the distinguished refugee (who was, in fact, a Swiss citizen), when the latter resolved to prevent a rupture by leaving his adopted country. He now proceeded to England, and settled in London. With certain members of the British aristocracy, he came to live on a footing of considerable intimacy, and there can be no doubt that he was also an object of languid wonder and interest to the community generally, but he impressed nobody with a belief in his future and his genius; nay, Englishmen erred so far as to suppose that the "silent man" was merely "dull." In 1838 he published in London his *Idées Napoléoniennes*, which, read in the light of subsequent events, are very significant. Europe generally regarded them as idle dreams; but in France the book went through numerous editions. In 1839 Louis

Napoléon was in Scotland, and took part in the celebrated Eglinton tournament. Next year (1840), taking advantage of the sentiment aroused by the bringing home of the ashes of his uncle from St. Helena, he made another attempt on the throne of France at Boulogne. It was as grotesque a failure as the one at Strasbourg, and undoubtedly provoked a certain feeling of contempt for its author in the mind of the general public. Captured on the shore, while endeavoring to make his escape to the vessel that had brought him from England, Louis Napoléon was again brought to trial, and condemned to perpetual imprisonment in the fortress of Ham. Here he composed several works: *Aux Mânes de l'Empereur; Fragments Historiques; Analyse de la Question de Suisse; Réponse à M. de Lamartine;* and *Extinction du Paupérisme;* wrote political articles for the democratic journals, and actually took part in editing the *Dictionnaire de la Conversation*, a valuable French encyclopædia. After an imprisonment of more than five years, he made his escape (May 25, 1846), by the help of a Dr. Conneau, in the disguise of a workman, and gained the Belgian frontier, whence he returned to England. The revolution of Feb. (1848) caused him to hurry back to France, where he professed himself devoted to the views of the provisional government; the latter, however, requested him to leave the country. This he promised to do; but being elected deputy for Paris and three other departments, he took his seat in the constituent assembly, June 13, 1848. A stormy debate followed, and on the 15th he resigned his seat, and, either from policy, or patriotism, left France. Recalled to France in the following September by a quintuple election, he once more appeared in the assembly, and at once, through the agency of his zealous associates, commenced his candidature for the presidency. The masses were—rightly or wrongly—thoroughly in his favor. Out of seven and a half million of votes, 5,562,834 were recorded for prince Louis Napoléon; gen. Cavaignac, who was nearest to him, obtaining only 1,469,166. This fact is declared by the partisans of the emperor to be an absolute proof of his popularity, for at this period he had neither power nor money to force or bribe opinion. On Dec. 20 he took the oath of allegiance to the republic. For a few days concord seemed to be re-established between the different political parties in the assembly; but the beginning of the year 1849 witnessed the commencement of a series of struggles between the president and his friends on the one side, and the majority of the assembly on the other—the latter being profoundly penetrated with the conviction that Louis Napoléon was not devoted to the interests of the republic, but to his own. The French expedition to Italy and the siege of Rome were, above all, the causes of violent discussion in the chambers. This anarchic condition of things, in which, however, the president tenaciously held his ground, was summarily put a stop to by the famous or infamous (for opinions differ) *coup d'état*, Dec. 2, 1851. The principal actors in this midnight deed were the president himself, M. de Morny, M. de Maupas, and gen. St. Arnaud. The circumstances that marked it were of necessity odious and even atrocious; and there cannot be the shadow of a doubt that it engendered in the mind of Europe a distrust of the honesty of Louis Napoléon, which, perhaps, was never during his life wholly removed. His success was certainly magnificent, but the cost was also enormous. The feeble attempts at an armed resistance in Paris were put down by the military, who were favorable to the president, and under the command of his accomplices. A rigorous system of repression was put in force both in Paris and in the departments, and the deportation to Cayenne and Algeria became painfully familiar to the European public. France, as a whole, however, whether wearied of the incompetent democrats, or (as Kinglake supposes) "cowed" by the terrible audacity of the president, appeared to acquiesce in his act; for when the vote was taken upon it on the 20th and 21st of the same month, he was re-elected president for ten years, with all the powers he demanded, by more than 7,000,000 suffrages. His enemies affirm they were obtained by terrorism, and of course the same value cannot be placed upon this as on the previous expression of national confidence. Louis Napoléon was now emperor in fact; nothing was wanting but the name. This was assumed exactly a year after the *coup d'état*, in accordance, as it appeared, with the actual wish of the people. Among the events of his subsequent reign were the conspiracies against him (1853), the attempts at assassination (by Pianori, 1855, and Orsini, 1858), the Anglo-French alliance and the Crimean war (1854–56), the Franco-Italian war (1859), and the Mexican campaign (1863). In 1870 Louis Napoléon declared war against Prussia; and, after several terrible defeats, he surrendered himself a prisoner at Sedan in September. Till the conclusion of peace he was confined at Wilhelmshöhe. In Mar., 1871, he joined the empress at Chiselhurst, Kent; and resided there till his death, on Jan. 9, 1873.—In 1853 the emperor married Eugéne Marie, countess of Montijo. Their son, Eugéne Louis Jean Joseph, prince imperial of France, was born Mar. 16, 1856. He was in the field with his father in 1870, but after the fall of Sedan escaped to England, where he entered the Woolwich military academy, and in 1875 completed with distinction a regular course of study. Volunteering to serve with the English artillery in the Zulu campaign of 1879, he was killed in June, when reconnoitring, by a party of Zulus in ambush.

LOUIS PHILIPPE, King of the French, b. at Paris, Oct. 6, 1773, was the eldest son of Louis Philippe Joseph, duke of Orleans. He received at his birth the title of duke of Valois, and afterward that of duke of Chartres. His education was intrusted to the care of

the celebrated Mme. de Genlis. He entered the national guard, and became a member of the club of friends of the constitution, afterwards that of the Jacobins. Along with his father, he renounced his titles, and assumed the surname of Egalité. He showed both courage and capacity in the war; but his situation became very dangerous after the unsuccessful battle of Neerwinden, in which he commanded the center. He was included in the order for arrest issued against Dumouriez, and on April 4, 1793, escaped along with him into the Austrian territory. He sought in Switzerland a place of security for his sister Adelaide, wandered about amongst the mountains for four months, and accepted a situation as teacher of geography and mathematics in a school at Reichenau, near Chur, assuming the name of Chabaud-Latour. He afterwards wandered for some time in the n. of Europe, and then went to North America. In 1800 he took up his abode at Twickenham, near London, with his two younger brothers, both of whom soon after died. In 1809 he married Marie Amelie, daughter of Ferdinand I. of the Two Sicilies. On the fall of Napoleon, he hastened to Paris, where he was received with distrust by Louis XVIII. After the second restoration, he recovered his great estates, which the imperial government had sequestrated. Disliked by the court, he was very popular in Paris. He kept aloof, however, from political intrigues; and the three bloody days of the revolution of 1830 were nearly over ere he was brought forward, the banker Laffitte proposing in the provisional committee his appointment as lieut.gen. of the kingdom, from which he proceeded to the acceptance of a constitutional throne, Aug. 9, 1830. He defended his conduct towards the elder Bourbons by protesting that he acted for the welfare of France. He cultivated peaceful relations with foreign powers, sought to strengthen his throne by gaining the support of the middle classes, and repressed all the extreme parties by what became known as the *juste-milieu* (q.v.) policy. The extreme democrats hated him, and frequent attempts were made on his life, by *infernal machines* and otherwise. The country prospered under his government, but a demand for reform in the electoral system became loud and general, and was unwisely opposed by the king and the Guizot (q.v.) ministry: whilst the conduct of the former in the matter of the marriages of the queen of Spain and her sister, manifesting a disregard of every consideration but the interests of his own family, excited a strong feeling of indignation throughout Europe. The French nation became much excited; "reform banquets" began to be held; the government attempted to prevent them by force; insurrectionary movements ensued in the streets of Paris on Feb. 22, 1848; and the "citizen king" saw with alarm that the national guard could not be expected to support him. On Feb. 24, he abdicated in favor of his grandson, the count de Paris; but the chamber of deputies refused to acknowledge the boy as king. Louis Philippe, deserted by his courtiers, fled to the coast of Normandy along with his queen, concealed himself for some days, and at length found opportunity of escaping in a British steamboat to Newhaven under the name of Mr. Smith. The brief remainder of his life was spent in England. He died at Claremont, Aug. 26, 1850.

LOU'ISVILLE, a city of Kentucky, on the falls of the Ohio, 130 m. below Cincinnati. It is handsomely built, with broad streets on a level plain. Main street is 3 m. long. The city is supplied with water from the Ohio, and by artesian wells, one of which has a depth of 2,086 ft., a three-inch bore, and supplies 330,000 gallons of water in 24 hours, which rises to a height of 170 feet. The court-house cost $1,000,000. There is a fine custom-house, jail, a marine asylum, 10 orphan asylums, hospitals, houses of refuge, 95 churches, 5 daily and 16 other papers, several pork-packing establishments (at which, in 1873–74, 226,947 hogs were slaughtered), large leather and tobacco factories, etc. Steamers pass over the rapids of the Ohio at high water, but at other times pass through a canal and locks. Pop. 1870, 100,753. It was named Louisville (1780) in honor of Louis XVI. of France, whose troops were then assisting the Americans in the war of independence.

LOUISVILLE (*ante*), the chief city in Kentucky and co. seat of Jefferson co., is situated about midway of the length of the Ohio river; 400 m. from its mouth and 600 from its head at Pittsburg; pop. '80, 123,645. The falls or rapids of the Ohio have here a descent of 27 ft. in 2½ m., affording a fine water-power, not yet much utilized. The Louisville and Portland canal, through which steamboats pass when it is low water over the falls, is 2 m. long; has 3 locks, 480 ft. long and 90 ft. wide; and has a capacity for steamboats of 3,000 tons. It was built by the people of Louisville, the U. S. government contributing; and since 1874 has passed under the control of the latter, being free to commerce excepting a small charge levied for a fund for repairs. Formerly an unhealthy situation, subjected to malarial and bilious fevers, an adequate system of drainage and sewerage has remedied this; and it is now one of the healthiest of southern cities. It is laid out in broad streets, lined with shade trees in the portion devoted to private residences; the latter being built with lawns and gardens in front, making a most agreeable appearance. A number of important lines of railroad connect Louisville with the northern and southern railroad systems, including the Louisville, Nashville and Great Southern; Louisville, Paducah and Southwestern; Louisville, Cincinnati and Lexington; and the Jeffersonville and Indianapolis, New Albany and Chicago, Ohio and Mississippi, Louisville and St. Louis, etc. A bridge of stone and iron crosses the river at the head of the falls, having 27 spans, and a total length of 5,218⅔ ft., and which cost $2,016,819.63. An important industry is the sugar curing of

hams, and pork-packing. This city is also one of the largest markets for leaf-tobacco in the world, exporting enormous quantities to France, Germany, England, and the Dominion of Canada. There is also a very large and growing manufacture of cigars, 86 manufactories having made, in 1874, nearly 14,000,000 cigars. The manufacture of whisky is also an enormous business in Louisville, while it is the point of distribution for the excellent and popular whiskies made in the Kentucky distilleries. Other important manufactures are the Louisville cement, leather, furniture, iron pipe, etc. The city has an efficient paid fire department, with telegraph and signal system. An adequate police force, comprehensive street railway system, and excellent system of public schools, with its other manifest advantages, combine to place Louisville on a par with the other well-constructed and well-governed cities of the world.

LOU'LE, a t. of Portugal, in the province of Algarve, 6 m. n. by w. from Faro, and 130 m. s.e. from Lisbon. It is pleasantly situated on a hill amid groves of cork trees and pomegranates. The remains of a Moorish castle form a conspicuous feature in the scene. Loulé is one of the most thriving places in Portugal, and has more than doubled its population within the last 40 years. Baskets of aloe-thread are a principal article of manufacture. Pop. about 13,000.

LOURDES, a t. of s. France, department of Hautes-Pyrénées, on the right bank of the Gave-de-Pau, 24 m. s.e. of Pau; pop. 4,577. It is at the base of an almost inaccessible rock about 500 ft. high, on which is a fortress formerly possessed by the counts of Bigorre, but now used as a prison. The place was fortified by Julius Cæsar. Remains of Roman fortifications are found, and some curious grottoes in the vicinity. When the English held it in the 14th c., it was the center of their military operations, but after the treaty of Bretigny in 1460 it was evacuated by them. Manufactures of handkerchiefs and flax, and a general trade in agricultural produce, are carried on. It is a noted place of pilgrimage among Roman Catholics on account of the alleged appearance of the Virgin Mary to two girls, Feb. 14, 1858. In 1872 about 20,000 persons resorted to the grotto of the Virgin Mary. It is alleged that many miraculous cures have been wrought in answer to prayers offered at this shrine. In some, at least, of the many instances alleged, the fact of wonderful healing seems to be authenticated: the explanations of the fact vary greatly, according to the scientific or religious theories of the critic. One of the common explanations has been that the quickening of hope and imagination in certain susceptible natures has effected a cure by the operation of purely natural causes. This evidently leaves room for those who believe in healing by the power of prayer, to say that prayer is by a natural law the stimulant of hope; and that it in no wise derogates from the power of prayer to say that its place among the forces by which God governs the world is so sure that his answers to it flow along the lines of natural law. But perhaps the distinction between natural and supernatural may need to be revised.

LOUSE, *Pediculus,* a genus of insects, the type of a very numerous family, which forms the order *parasita* or *anoplura.* The body is flattened, almost transparent; the segments both of the thorax and abdomen very distinct; the mouth is small and tubular, inclosing a sucker; there are no wings; the legs are short, and are terminated by a claw adapted for taking hold of hairs or feathers. The eyes are simple, one or two on each side of the head. All the species are small, and live parasitically on human beings, terrestrial mammalia, and birds. They deposit their eggs on hairs or feathers, to which they attach them by a glutinous substance; and they multiply with astonishing rapidity. The young cast their skin several times before they reach their maturity, which in the best known species is said to be about eighteen days after they are hatched, but, from the first, they are very similar to their parents. Animals of different kinds are infested by different species of louse peculiar to them; those which are found on birds exhibiting characters considerably different from those of man and mammals. The same species is rarely found on different species of animals, unless very nearly allied; but some animals have more than one of these parasites. Three infest the human race: one confined to the head, the COMMON LOUSE (*P. capitis*); another, the BODY LOUSE (*P. vestimenti s. corporis*), very similar to it, but of a larger size; a third, the CRAB LOUSE (*phthirius pubis*), sometimes found in the eyebrows, but more frequently in the pubic region, and chiefly in persons of licentious habits; having the body broader, and other characters considerably different from the other two. The common or head louse is a very common parasite. The symptoms which the bites of these insects produce are a troublesome itching, and a more or less apparent eruption upon the scalp, the eruption being usually accompanied by small incrustations of blood produced by scratching off the epidermis. On examining the head, in addition to the insects, numerous eggs called *nits* are found, which are of a pyriform shape, and adhere firmly to the hairs. In six days the young escape from the egg; at the age of eighteen days these are again ready to lay eggs; and the female lays 50 eggs in all; so that the rapid augmentation of these insects is easily accounted for. When only a few lice are present, they may be removed by careful combing, or may be killed by the free application of oil or pomatum to the head; but when they are abundant, the scalp should be sprinkled with the Persian insect-powder (*pyrethrum caucaseum*), which, according to Küchenmeister,

soon kills them, or rubbed with white precipitate ointment, which is the most common remedy in this country.

The body louse causes most irritation on those parts of the skin which correspond with the folds and seams of the clothing about the neck and round the waist where the clothes are fastened to the body. The irritation is of the same character as that caused by the preceding species, and the treatment is similar. It is said that the clothes may be purified by burying them in hay for several weeks, but the safer plan is to destroy them. The irritation caused by the crab louse is greater than that caused by the other species. It may be destroyed by one or two applications of an essential oil (oil of rosemary for example), or of white precipitate ointment.

Whether the *pediculus tabescentium*, or louse occurring in the *lousy disease*, is or is not a distinct species, is still an open question. Indeed, the fabulous element enters so largely into most of the recorded cases of this disease—as, for example, when Amatus Lusitanus relates that two slaves were incessantly employed in conveying to the sea in baskets the lice which appeared on the body of their master—that the question is of comparatively little importance.

An interesting question has been raised with regard to the lice infesting human beings, it being alleged, by those who desire to establish the essential diversity of certain races, and particularly by Americans anxious to make out the widest possible difference between the European race and negroes, that the lice found on different races are specifically different. The subject has been examined with great care by Mr. Murray of Conland, and with evident impartiality; the result being, as appears from his paper in the *Transactions of the Royal Society of Edinburgh*, 1860–61, that the differences among these parasites are like those among the races of men themselves, easily observed, but not certainly specific.

LOUTH, a maritime co. of the province of Leinster, in Ireland, bounded n. by Armagh and by the lough of Carlingford, e. by the English channel, s. by the Boyne and the co. of Meath, and w. by Meath and Monaghan. Pop. '71, 84,021. Its area is 315 sq.m., or 202,523 acres. In this county 106,071 acres are under tillage, 69,322 pasture, 4,882 in plantations, 21,595 waste, bog, towns, etc., and 653 under water. There is an extensive tillage of wheat, barley, oats, and green crops. Linen also is largely manufactured. The surface is flat, with the exception of the lofty range on the n., which stretches e. and w., and terminates, at a height of 1935 ft., in Carlingford mountain, overlooking the bay of that name. This range consists of a granite nucleus, supporting limestone and clay-slate on its flanks. The soil of the level districts is extremely fertile, and eminently suited for wheat-crops. The chief rivers are the Boyne (its boundary on the s.), the Fane, the Glyde, and the Dundalk river. The chief towns are Drogheda, Dundalk, and Ardee. Louth anciently formed portion of the territory of Oriel or Or-gial, but was occupied by De Courcy, and formed into a county by king John in 1210. It was early apportioned among the military adventurers who accompanied De Courcy and De Lacy; but most of these original settlers have been displaced by later confiscations and apportionments of territory, especially after 1641 and 1690. It abounds with Celtic antiquities, some of which, in the neighborhood of Dundalk, are of great interest. The ecclesiastical antiquities are very striking. There are two round towers, at Monaster-boyce and at Dromiskin. At Mellifont are the remains of a beautiful abbey. In Drogheda several ruined abbeys are still visible, as also at Louth and Carlingford. But the most interesting of all the relics of antiquity in Louth are the celebrated sculptured crosses of Monaster-boyce, of which the larger is 18 ft. in height. The county of Louth returns two members to the imperial parliament. It is in the Belfast military district, except Drogheda, which is in the Dublin district.

LOUTH, a large market t. and municipal borough of England, in the co. of Lincoln, 25 m. e.n.e. of the city of that name, on the Ludd. It contains a recently erected mansion house, with a court-house and assembly-room; a beautiful parish church of the latter part of the 14th c., with a rich octangular spire 300 ft. in height; and a grammar-school, with an endowed annual income of £620 a year. Iron foundries, tanneries, oil-cake mills, and carpet factories are in operation. By means of the canal, extending between Louth and Tetney haven on the estuary of the Humber, considerable traffic in corn and coal is carried on. Pop. '71, 10,500.

LOUVAIN (Ger. *Löwen*, Flemish, *Leuven*), a city of Belgium, in the province of Brabant, on the Dyle, 16 m. e.n.e. of Brussels. It is of considerable extent, but great part of the ground is occupied with fields and gardens. Pop. '76, 33,917. It was at one time much larger. During the 14th c., when it was the capital of the duchy of Brabant, it contained 200,000 inhabitants, and 4,000 cloth manufactories. The citizens, however, endeavoring, in the latter part of the 14th c., to assert their independence, along with those of other towns of Flanders, were defeated; and many of the weavers from whose industry the city had in a great measure derived its wealth and importance, took refuge in England, and thus contributed not a little to the prosperity of that country. Louvain has never recovered from the blow which it then received. It is not now a place of much industry, but has very large breweries, some tobacco and lace manufactories, etc., and a European fame for bell-founding. The university, founded in 1426 by duke John of Brabant, was, in the 16th c., regarded as the greatest in Europe, particularly excelling

in the department of Roman Catholic theology. It had more than 6,000 students. It was suppressed for some time, in consequence of the French revolution, but restored by the Dutch government in 1817. The state relinquished it again in 1834, but the Roman Catholic clergy restored it at their own expense in 1835. It has a large library and a botanic garden, and is the most numerously attended of Belgian universities.

L'OUVERTURE. See TOUSSAINT, FRANÇOIS DOMINIQUE, *ante*.

LOUVET DE COUVRAY, JEAN BAPTISTE, 1760–97; b. Paris; son of a paper merchant; of moderate education. Before the revolution of 1789 he achieved a reputation by the publication of a licentious romance, the fashion of its time. He entered with ardor as a satirical writer into the politics of the revolution. His *Revue des Armées blanche et noir*, a satire on the nobles and clergy, has survived. That was followed by a romance, entitled *Emilie de Vermont*, as remarkable for its purity as his first work for the contrary. In 1790 he published a pamphlet entitled *Paris Justifié* in reply to strictures of the French *émigrés* on the excesses of the revolution. He then became a member of the Jacobin club, where he was conspicuous as an orator, and edited the journal of the Jacobins. He had the boldness to attack Robespierre in the club in 1792, and his name was striken from the list of members by that despot. He joined the Girondists in the convention, and his speeches at this stage of the revolution were remarkable for eloquence and daring defiance of the Jacobins. His apostrophe of accusation against Robespierre in the convention is considered the masterpiece of that exciting session. Mme. Roland classes it with the great efforts of Cicero. But the Robespierre party triumphed; Louvet was doomed to the guillotine, escaped, and hid in the mountains—tracked like a beast. After the fall of Robespierre he returned to the convention, was made president of the subsequent assembly, and member of the committee of public safety. The last year of his life was imbittered by the slanders of the party of reaction, and his own principles were modified by the desire to promote the speedy repose of France.

LOUVIERS, a t. of France, department of Eure, on the navigable river Eure, 60 m. n.w. of Paris. It has a cathedral, and celebrated cloth-manufactures, the annual value of which is between three and four million francs. Pop. '76, 10,097.

LOUVOIS, FRANÇOIS MICHEL LETELLIER, Marquis de, the war-minister of Louis XIV., was b. in Paris, Jan. 18, 1641. His father was chancellor and secretary of state in the war department, and purchased for him the reversion of this office. Louvois displayed great administrative ability; but his desire of power was insatiable, and he was willing to involve the whole world in the horrors of war, that he himself might be indispensable to the king. His war-policy was also ruthless. He caused the Palatinate to be wasted by fire and sword in 1674. For some time he was, after the king himself, the most powerful man in France. After the death of Colbert, financial affairs came under his control, and the system of extortion and borrowing which he pursued was among the causes of the revolution. He partially lost favor with the king by counseling him against the marriage with Mme. de Maintenon; but afterwards instigated the persecution of the Protestants, and involved France in the long war with the German empire, 1688–97. In 1689, with the alleged view of securing the confines of the kingdom, he again caused the Palatinate to be desolated. Mme. de Maintenon directed the attention of the king to these atrocities, who thereupon forbade the burning of Treves; but Louvois declared that, to save trouble to the king's conscience, he had already issued orders for reducing that city to ashes. The king, upon hearing this reply, seized the tongs from the chimney, and would have struck his minister with that ready weapon, if Mme. de Maintenon had not stepped between. Such scenes were repeated from time to time, and the health of the vain and ambitious minister gave way. He died suddenly, July 16, 1691. Louis is said to have rejoiced at his death.—An elaborate history of Louvois's administration, from original documents in the archives of the dépôt de la Guerre, by Camille Rousset, appeared in 1861–63 (4 vols., Paris).

LOUVRE (Fr. *l'ouvert*, the opening), an ornamental opening of a turret shape, placed on the roof, to allow the smoke or foul air to escape from large apartments, such as halls, kitchens, etc. These were particularly required in ancient times, when the fire was placed in the center of the room, and there was no chimney to carry off the smoke. They are frequently used as ornaments where not required for use, and are then glazed and made into lanterns (q.v.). The sides of the louvre were lined with horizontal overlapped boarding, with a space between the boards, which let out the smoke without admitting the rain. Hence, this sort of boarding, frequently used for the windows of bell-towers, etc., acquired the name of *louvre-boarding*.

LOUVRE, PALACE OF THE, the extensive buildings in Paris inclosing a quadrangular square at the e. end of the court of the palace of the Tuileries, and now connected with the latter. They are on the n. bank of the Seine, in the center of the city. The s. façade is on the quay of the Seine called *quai du Louvre*, the n. on the *rue Rivoli*, the e. on the *rue du Louvre* facing the old church of *St. Germain les Auxerrois*, and the w. facing the magnificent, recently built façades of the palace of the Tuileries. The site is supposed to have been originally a hunting rendezvous and king's castle. History does not reach back of the time when it was used as a royal habitation. A "new tower"

was erected in the center of the court in 1204, and used as an arsenal and prison. Francis I. took it down in 1527 because it was unsightly and darkened the courtyard; Charles V. had previously made some additions, among them a library room with 959 vols., the germ of the present bibliothèque nationale, with its 3,300,000 volumes. When Francis I. entertained Charles V. in 1539, he endeavored to disguise the bad condition of the old palace inside and out by temporary walls, repairs, and furniture; but was so dissatisfied with the result that he decided on its entire reconstruction on a new plan. The old Gothic edifices in the midst of fortified towers and prison walls were razed, and the present design of the quadrangular inclosure was adopted. The old court inclosed about 400 ft. square, and the inclosing palaces have 4 outer façades, 538 ft. and 576 ft. long, respectively. The w. side was built after designs by Pierre Lescot, mostly in the reign of Francis I. Henry II. commenced and Henry IV. finished the long gallery w. of the s.w. corner of the original quadrangle, with its main façade on the Seine. This is not properly a part of the Louvre, but a connecting link between the old and distinct palatial groups of the Louvre and the Tuileries. Being first connected with the Louvre, it has taken its name. It was completed in 1608, and is still one of the most ornate buildings in France. The sculptures of Jean Gougon in the friezes of the façade upon the Seine are the most exquisite examples of architectural sculpture in existence. Louis XIII. about 1624 had the w. side of the quadrangle completed. Under Louis XIV. the s. side was first completed; and then, by order of Colbert, architects were requested to send in designs for the e. side. The most beautiful design proved to be that of a physician, an amateur architect, Claude Perrault. Fortunately, its beauty secured its adoption, and that façade is now one of the classic models of the world. The e. façade was begun in 1665 and finished in 1670, and is known as the colonnade of the Louvre. It is 555 ft. long and 90 ft. high. But the edifice, of which it was only the façade, was not finished at that time. Louis XIV. concentrated all his extravagance on Versailles, and for many years this most noble portion of the Louvre was roofless, and going to destruction. Its basement story was used for stables, and its upper portions were temporarily covered to make rooms for artists and employees of the court. "It was a grand free hotel, where each one made his bed in his own fashion, and looked out for himself." In 1754 the e. colonnade and the façade now fronting the *rue Rivoli* were encumbered with temporary constructions that almost shut them from view. Louis XV. was induced to order their demolition, and to finish the designs that Perrault had conceived. But it was not done when the revolution of 1789 opened. The entire place on the e. and n. was still almost hidden behind the crowd of houses built against and in the midst of the unfinished palace buildings. Hills of rubbish encumbered the court. This remained the condition of this noble building until the last years of the first republic, when the work of clearing away the parasites was begun. When Napoleon's victories in Italy gave him the spoils of its works of art in the beginning of the present century, he ordered the restoration and completion of the buildings, and made them the repositories of the art works of France. The façade facing the court to the w. was remodeled and finished in his reign. He also contemplated the work, subsequently done by Napoleon III., of connecting the Tuileries with the Louvre by a continuous line of palaces on the n. and s. sides. Fortunately, he executed but a small part of the project, and that after designs so inferior to other parts that they still stand between exquisite examples of architectural art on each side, which preceded and succeeded them, as marplots in the midst of that aggregation of beautiful palaces. The government of Louis XVIII. and Charles X. continued the work of finishing the interior of the Louvre. In the reign of Louis Philippe the plan of connecting the Louvre with the Tuileries was agitated. M. Thiers demanded 100,000,000 francs for this and a mass of other work which he desired to have undertaken. Fourteen millions was the sum named for the completion of the Louvre and the Tuileries. It was refused. Louis Philippe gave the project little support. When he was deposed in 1848, the provisional or republican government at once began the great work. Thiers and gen. Cavaignac secured the passage of a law which authorized the work subsequently pushed to completion by Napoleon III. The plan, by M. Visconti, was the same which, with slight modifications, has been made to redound almost exclusively to the credit of the emperor; though fully conceived and entered on before he was in the government. Yet it must be conceded that it is doubtful if such magnificent additions could have gone forward to completion under a government more popular and liable to more frequent changes in legislation. In connection with the grand avenues which he projected and completed, this work of connecting the Tuileries and the Louvre is the most splendid monument of expenditure in ornamental construction of modern times. The cost has probably been not less than $15,000,000. It was fairly underway in 1854, and completed in 1859. The palaces of the Louvre and the Tuileries combined, with their inclosed courts, cover about 60 acres.

The museums and galleries of the Louvre, now the most extensive and the choicest collection of art works in the world, have acquired nearly all their greatness within our own century. The nucleus was made by the taste and liberality of Francis I., who not only appreciated, but gathered the artists and art works of all countries around him. But their works were mostly assembled at the palace of Fontainebleau. Colbert, in the reign of Louis XIV., made immense additions; all of which, remarks a writer of that time, were imprisoned by the royal *roué* in the palaces of Versailles, but "ought to be ranged

in beautiful order in the great halls of the Louvre, where they might be exposed to the admiration and joy of the French and the curiosity of strangers, and become a source of study and emulation to a French school of art." It has taken two centuries to effect the accomplishment of that wise advice. Before the time of Louis XVI. the galleries of the Louvre had become the principal museum of valuables, both of mechanical and art works: and the seat of the royal academies of sciences, belles-lettres, architecture, painting, and sculpture. In 1775 it was proposed to gather all the masterpieces of art belonging to the kings in the long gallery, but it was at Versailles, instead, that they continued to accumulate. The republic of 1791 broke up this royal selfishness. The immense art resources of France were brought out of the royal catacombs, collected, systematized, and exposed to public view in the great halls of the Louvre. It was during the fermentation and the horrors of the great revolution of 1791 that the present national museum was ordained, and a commission appointed by the legislative assembly to collect all works of greatest value and beauty from the royal galleries and transport them to the Louvre, to form the museum of the republic. At a moment when France was almost crushed by a foreign coalition and in the heat of internal turbulence, Roland, then minister of the interior (1792), was instructed to plan the organization of that vast museum. The *muséum Français*, afterward called *musée central des arts*, was opened in 1793. But it was a heterogeneous mass until many years after. In 1798 it was enriched by the pillages of Napoleon I. in Italy. Since that time each new government of France has been ambitious to enlarge and perfect all departments of its museums. There never have existed museums comparable in extent or perfectness of arrangement to those of the Louvre at the present time.

LOV'AGE, *Ligusticum*, a genus of plants of the natural order *umbelliferæ*, allied to *angelica*, the fruit elliptical, each carpel with five sharp somewhat winged ribs, and many vittæ in the interstices. COMMON LOVAGE (*L. officinale*, or *L. levisticum*) is a native of the s. of Europe, with ternate decompound leaves, and obovate-wedge-shaped leaflets. It is sometimes cultivated in gardens, and notwithstanding its strong and peculiar odor, is used as a salad plant. Its roots and seeds are aromatic, acrid, and stimulant, and are used to cure flatulency and to excite perspiration. A liquor called *lovage* is made from them. Very similar in appearance and qualities is the only British species, SCOTTISH LOVAGE (*L. Scoticum*), a native of the sea-coasts in the northern parts of Britain. It is eaten, both raw and boiled, by the Shetlanders. The flavor is aromatic, but acrid, and very nauseous to many who are unaccustomed to it.

LOVAT', a river of Russia, rises in the Witebsk marshes, and flows through the governments of Pskov and Novgorod into lake Ilmen. Its total length is 267 m., and it is navigable for barges of 50 tons as far up as Kholm, more than 80 m. from its mouth.

LOVAT, SIMON FRASER, Lord, was b. about the year 1676, and was the second son of Thomas Fraser, fourth son of Hugh, ninth lord Lovat. His mother was Sybilla, daughter of the chief of the Macleods. The Frasers, a family of Norman origin, had obtained Highland territories, in the county of Inverness, in the 13th c., and had established themselves as the patriarchal chiefs of the Celtic inhabitants within these territories, rather than as landlords, in the feudal acceptation of the term. The first settler—or, more probably, the first who gained renown—was named Simon, and hence his descendants were called sons of Simon, or M'Shime. The descendant here commemorated had little hope of succeeding to the estates and honors, until the prospect opened to him under a settlement by his cousin lord Lovat. The succession was not indisputable, but until a much later period in the Highlands, influence with the clan often superseded direct hereditary descent. Simon at an early period gained their hearts. His first adventure was an effort to get forcible possession of the young sister of the late lord, who had more legal claims, as heiress to the Fraser estates. Baffled in this, he, for a reason which has defied all attempts to discover, seized on the widow of the late lord, a lady of the Athole family, and compelled her to marry him. As this was not only a crime, but an offense to a powerful family, Simon could only protect himself from punishment by force, and thus he kept up a petty rebellion for some years. On the accession of queen Anne, when his opponents became all-powerful, he fled to the continent. He was at the bottom of the affair called the Queensberry plot in 1703, in which he professed to reveal the policy of the exiled court, and a plan for a rising in their favor among the Highlanders. On the discovery that he had hoaxed Queensberry and other statesmen, and was playing a deep game of his own, he escaped with difficulty to France. Of the method of his existence there during twelve years, there are only mysterious rumors, by one of which he was reputed to have taken orders as a Romish priest. He had been outlawed for his outrages, and another enjoyed his estates by the letter of the law; but he was still the darling of his clan, and on the breaking out of the insurrection of 1715, they sent a sort of ambassador to bring him over. What followed is remarkable, as showing that the Highlanders were led by the politics of their chiefs, not by their own prepossessions. The holder of the estates having joined the insurrection, Simon found it his interest to take the government side. His clan at once left the insurgents; and for this good service he was invested with the estates, not only by the votes of his clan, but by the law. His life, for the ensuing 30 years, was active with local intrigues calculated to strengthen his influence. In the insurrection of 1745, he tried to play a double game,

sending forth his clan, under the command of his son, to fight for the pretender, and deeply plotting for that cause, while he professed to be a loyal subject. He was a special object of the vengeance of the government, and after a trial by his peers, was beheaded on April 9, 1747. He was remarkable as a type of that class of Highland chiefs who professed to be led by policy as sovereigns, rather than by the laws of the country or its social system, and who were ashamed of no turpitude, fraud, or violence, if it tended to the aggrandizement of themselves and their clans.

LOVE-APPLE. See TOMATO.

LOVE-BIRD, *Psittacula,* a genus of birds of the parrot family (*psittacidæ*), a group of beautiful and very small species, natives of the warm parts of America, of Africa, and Australia. They receive their name from the affection which they manifest towards one another, whether in a wild state or in a cage. An Australian species, about the size of a sparrow, is now common as a cage-bird in Britain. They are lively birds, and fond of being caressed. They feed on the seeds, etc., on which canaries are fed, and are very fond of chick-weed and other plants, with seeds ripe or nearly so. Anatomically, this genus is remarkable in the parrot tribe for having no *furcula* (merry-thought bone).

LOVE-FEASTS (AGAPÆ, *ante*), are now celebrated, 1. by the Moravians, in strict accordance with the primitive custom and on various occasions, generally in connection with a solemn festival, or preparatory to the communion. Hymns are often used that have been composed and printed expressly for the occasion. In the course of the meeting, a simple meal of biscuit and coffee, or tea, is served, of which the congregation partake together. In some churches the minister makes an address at the close. 2. Wesley introduced the observance among the Methodists, appointing one evening in each quarter for the men, another for the women, and a third for both together. The food is only plain cake and water. Only members of the church attend, and admission is secured by tickets. The same rule is nominally established in the Methodist-Episcopal church, but is not strictly enforced, members of the congregation also being admitted. The feast is celebrated at the quarterly conference, under the charge of the presiding elder, or, in his absence, of the pastor of the church. The service begins with reading the Scriptures, singing, and prayer. During the distribution of bread and water, of which all partake, persons so disposed relate their Christian experience. A report concerning the prosperity of the church is made by the pastor, and the names are read of those who have been received, excluded, or dismissed by certificate, of those who have died, and of those who have irregularly withdrawn. 3. Love-feasts after the primitive order are held in some, at least, of the Baptist missionary churches. At Berlin, Prussia, where they are held quarterly, they serve as an occasion for general social assembling in which coffee and cake take the place of bread and water.

LOVEJOY, ELIJAH PARISH, 1802–37; b. in Albion, Me.; graduated at Waterville college in 1826; went to St. Louis, Mo., where he was engaged first as a teacher, then as a political editor; studied theology at Princeton, and in 1833 was ordained a Presbyterian minister; returned to St. Louis and became editor of the *Observer*, a religious journal. Antislavery agitation was then rife throughout the free states, and Mr. Lovejoy, while disclaiming any connection with the abolitionists, was yet imbued with the old-time New England hostility to slavery and with an earnest zeal for the freedom of the press. Occasional paragraphs in the *Observer*, evincing a firm but moderate opposition to slavery, gave great offense to the people of St. Louis. Censured and menaced for this exercise of the freedom of speech in a slave-holding community, he reminded his censors that the blood in his veins was kindred to that which flowed at Lexington and Bunker Hill, and declared that he could not consent to wear a chain. In the spring of 1836, a negro criminal was taken out of the St. Louis jail by a mob, chained to a tree, and burned to death. An attempt being made to indict the authors of the crime, judge Lawless, in his charge to the grand jury, laid down the doctrine that when a mob is hurried by some "mysterious, metaphysical, and almost electric frenzy," to commit a deed of violence and blood, the participators therein are absolved from guilt, and therefore not proper subjects of punishment. If the jury should find that such was the fact in the case before them, then, said the judge, "act not at all in the matter; the case transcends your jurisdiction; it is beyond the reach of human law." Mr. Lovejoy's comments upon the charge of judge Lawless aroused deep indignation in St. Louis, in consequence of which the office of the *Observer* was destroyed by a mob. He thereupon determined to remove his paper to Alton, Ill., but his press on being landed there was broken into fragments by lawless men. The citizens of Alton reimbursed him for his loss, and another press was procured. In Aug., 1837, the office was invaded by a mob and the press and types destroyed. Another press was brought to the place, but before it could be set up it was broken in pieces and the fragments thrown into the Mississippi. A strong body of law-abiding citizens, who felt that it would not be right to submit to the dictation of a mob, rallied around Mr. Lovejoy and offered to procure for him still another press. A convention, embracing men of the highest character from different parts of Illinois, met at Upper Alton and resolved that "the cause of human rights, the liberty of speech and of the press, imperatively demand that the press of the *Observer* be re-established at Alton with its present editor." The pro-slavery party were

equally determined that the paper should be suppressed. At this critical juncture a public meeting was called in Alton to consider whether the publication of the *Observer* there should be any longer permitted. At this meeting Mr. Lovejoy appeared and made an address. "I am impelled," he said, "to the course I have taken because I fear God. As I shall answer to him in the great day, I dare not abandon my sentiments, or cease in all proper ways to propagate them. I am fully aware of all the sacrifice I make in here pledging myself to continue the contest to the last. I am commanded to forsake father and mother, wife and children, for Jesus's sake; and as his professed disciple, I stand pledged to do it. The time for fulfilling this pledge in my case, it seems to me, has come. Sir, I dare not flee away from Alton. Should I attempt it, I should feel that the angel of the Lord, with drawn sword, was pursuing me wherever I went. It is because I fear God that I am not afraid of all those who oppose me in this city. The contest has come here, and here it must be finished. Before God and you all I have pledged myself to continue it, if need be, till death; and if I fall, my grave shall be made in Alton." This address had a powerful effect even upon some of his opponents, and for a time it was hoped that the mob could not be rallied for the commission of further violence; but when it became known that another press had arrived, an intense excitement followed. The mob was warned of the event by the blowing of horns. The mayor superintended the transfer of the press to a warehouse, and aided in storing it away. Friends of liberty and order volunteered to watch and defend it. Mr. Lovejoy could not consent that his friends should incur, for his sake, dangers not shared by himself, and therefore he joined the party of defense. On the evening of Nov. 7, 1837, the watchers armed themselves and entered the warehouse where the press was stored, resolved to defend it, if necessary, with their lives. No attack having been made at 9 o'clock, most of the defenders retired to their homes, leaving but a dozen or so, among whom was Mr. Lovejoy himself, on guard. Near midnight a mob of 30 or 40 men issued from the drinking-shops in the vicinity prepared for deeds of violence and blood. They threw stones at the warehouse, smashed the windows, and fired several shots; and then they set up the cry, "Burn them out." Preparations were making to fire the building, when the mayor, who had pursued a wavering course from the beginning, came to the spot, and consented to bear a message from the mob to Mr. Lovejoy and his friends, to the effect that if they would surrender the press they should not themselves be injured. These terms were rejected, and then went up the cry, "Fire the building, and shoot every abolitionist as he leaves." The roof being set on fire, five of the defenders rushed out, fired upon the mob, and returned. Mr. Lovejoy and two others next stepped out, and were fired upon by rioters concealed behind a pile of lumber. One of the shots was fatal to Mr. Lovejoy, who lived only long enough to return to the counting-room, where, after exclaiming, "I am shot," he fell down and expired. The event caused great excitement throughout the country, some defending, others excusing, and many more denouncing Mr. Lovejoy. William Ellery Channing was foremost among those who held that he was entitled to the honors of a martyr to the freedom of speech and of the press; but there were men high in influence and public station who did not hesitate to declare that he had "died as the fool dieth." The grave of Mr. Lovejoy, which was made upon a bluff overlooking the Mississippi, was unmarked for many years, but a monument, with an appropriate inscription, now stands above it, reminding those who visit it of the sacrifices which it has cost to maintain in this republic the freedom of the press.

LOVEJOY, OWEN, 1811–64; brother of Elijah P.; b. in Albion, Me.; educated at Bowdoin college, and removed to Alton, Ill., where, after witnessing the martyrdom of his brother, he knelt upon his grave and vowed eternal war against slavery. A man of powerful physique, intense feeling, and great magnetism as a speaker, he preached and lectured against slavery with a passionate energy that carried the people with him. In 1838 he became pastor of a Congregational church in Princeton, Ill., where he distinguished himself by the boldness of his attacks upon slavery from the pulpit. In 1856 he was elected to congress, where he took a leading part in the conflicts that preceded the rebellion. Repeated attempts were made to intimidate and silence him, and he was denounced as one who, in assisting slaves to escape, violated the constitution which he had sworn to support. More than once he was in danger of assassination. His reply to these denunciations was to proclaim that he had aided and would aid every fugitive slave that came to him for help. Died, Brooklyn.

LOVELACE, RICHARD, 1618–58; b. England, educated at Charterhouse school and Oxford. For presenting to the "long" parliament a petition from his native county, in favor of Charles I., he was imprisoned, and released only on giving bail in the sum of £40,000. In 1646 he commanded a regiment in the French army before Dunkirk, where he was dangerously wounded; and it is said that Lucy Sacheverel, the "Lucasta" of his poems, upon a false report of his death married another person. On his return to England in 1648, he was again imprisoned and did not regain his liberty till after the king's death. He had spent his fortune in the king's service; and from being, as Anthony-a-Wood says, "the most beautiful person eye ever beheld," "became very poor in body and purse." He had published, in 1649, *Lucasta, Odes, etc.*, containing many

spirited lyrics, and he was also the author of a comedy called *The Scholar*, and a tragedy, *The Soldier*, which have not been preserved.

LOVELL, JAMES, 1737–1814; b. Boston; graduated at Harvard in 1756; was usher of the Boston Latin school under his father, John. When the people of Boston, April 2, 1771, celebrated the first anniversary of the British massacre in that city, Mr. Lovell was the chosen orator of the occasion. After the battle of Bunker Hill he was imprisoned by gen. Gage, but exchanged in 1776. From 1776–82 he was a member of the continental congress; from 1784–88 receiver of taxes; in 1788–89 collector of the port of Boston; from 1790–14 naval officer. He was also for a time master of the North grammar school in Boston. Died in Windham, Me.

LOVELL, JAMES, 1758–1850; graduated at Harvard in 1776; was adjutant in Jackson's Massachusetts regiment, 1776–79, and of Lee's "legion" in the southern campaign. He took an honorable part in many of the battles of the revolution. Died at St. Matthews, S. C.

LOVELL, JOHN, 1710–88; b. Boston; graduated at Harvard in 1728; was appointed usher of the Boston Latin school 1729, and master in 1734; held the latter position until 1775, when the school was suspended by the siege of Boston. He was familiarly called "master Lovell" during this long period, and among his pupils were many of those who became prominent in the revolution. He was an accomplished classical scholar, and, though a rigid disciplinarian, highly popular as a teacher. At the dedication of Faneuil hall in 1743 he was the chosen orator. He was, however, a loyalist, and left Boston for Halifax with the British troops in 1776. Died at Halifax. His portrait is in the gallery of pictures at Harvard college.

LOVER, SAMUEL, artist, novelist, song-writer, and composer, was the son of a stockbroker in Dublin, and was born in that city in 1797. At an early age he showed a great desire to become an artist, and with genius and perseverance, succeeded so far that, in 1828, he was elected a member of the royal Hibernian society of arts. In 1833 he exhibited at the royal academy a portrait of Paganini, which is said to have brought him some reputation as a portrait-painter. As a miniature-painter, in Dublin, he took likenesses of the principal aristocracy and leaders of Irish society. But while thus engaged, he discovered that he possessed a genius for authorship as well as for art, and was encouraged to make some attempts in that direction by the favorable opinion of Thomas Moore. In 1832 he published a collection of short pieces, entitled *Legends and Stories of Ireland, by Samuel Lover, R.H.A., with six Etchings by the Author* (12mo, Dublin), which was favorably received, and followed by a second series, published in London in 1834. In 1837 Mr. Lover settled in London, and having made authorship his profession, contributed largely to the periodical literature of the day. He also wrote *Rory O'More*, a romance of Irish life, which immediately became popular. Its production on the stage, with the excellent acting of Power in the principal character, made the author still more known. His next publication was *Handy Andy*, commenced, but not completed, in *Bentley's Miscellany;* the entire work, with illustrations by the author, appearing in 1842. In 1844 Mr. Lover published *Treasure Trove, the first of a series of Accounts of Irish Heirs, etc.; with twenty-six Illustrations on Steel by the Author*. This was originally published in numbers, under the title of *L. S. D., or Accounts of Irish Heirs*, etc. As a writer of songs Mr. Lover holds a well-earned reputation; his *Rory O'More*, *Molly Bawn*, *Low-backed Car*, *Molly Carew*, and others, have long been established favorites with the public. In 1839 Mr. Lover published a collection of his *Songs and Ballads*, with the words only; but considerably more than 100 of his songs have been separately published with music, composed or adapted by the author himself. In 1844 Mr. Lover projected an entertainment called "Irish evenings," which was very popular both in London and the provinces. Its success encouraged him to visit the United States, where his entertainment was also well received. He returned from America in 1848, when he made his experiences there the material for a new entertainment, which he gave in London. Mr. Lover was for some years in the receipt of a pension from the crown, in recognition of his literary merits. Besides the works already mentioned, and his numerous songs, Mr. Lover was author of *Metrical Tales, and other Poems*, published in 1860. He was also the editor of a well-selected compilation of songs and ballads by various authors, entitled *The Lyrics of Ireland*, published in 1858. He died July 6, 1868.

LOVEWELL, JOHN, b. N. H. near the close of the 17th c.; d. 1725; son of John, an ensign in the army of Cromwell, who is said to have lived to the age of 120 years. In 1724–25 he was engaged as a captain of volunteers in several successful military expeditions against the Indians, but was killed in the latter year at the head of his company in an engagement with a body of Indians led by the chief Paugus. "Lovewell's pond," in New Hampshire, derived its name from the hero of that fight. The battle has been commemorated in a poem by Enoch Lincoln, a member of congress from Maine, delivered at the celebration of its centennial anniversary in 1825, and also in *The Expedition of Captain Lovewell*, by F. Kidder, published in 1865.

LO'VICZ, an ancient t. of Poland, on the Bzura, a tributary of the Vistula, in the government and 45 m. w.s.w. of Warsaw, is mentioned in history as early as 1136. About 1355 it became a favorite residence of the primates of Poland. It has taken a

prominent part in the political revolutions of the country. Pop. '67, 6,136. Six fairs are held here annually.

LOW, ABIEL A., b. Salem, Mass., 1811; received a common-school education, and at an early age turned his attention to commercial pursuits. Taking up his residence in New York, he soon became a successful and prominent merchant. He has long been a member, and at different times president, of the chamber of commerce. He is still in business in New York, having his residence now, as for many years, in Brooklyn, and is greatly esteemed as a public-spirited citizen, munificent in his contributions to various objects of public prosperity and to institutions of charity.

LOW, FREDERICK F., b. Frankfort, Me., 1828; went to California in 1849, and after being engaged for a time in mining operations, became a merchant in San Francisco, then a banker at Marysville; was a republican member of Congress 1861–63, collector of the port of San Francisco 1863–64, governor of the state 1864–68, and minister to China 1869–72.

LOW ARCHIPELAGO, or PAUMOTA ISLANDS, a very extensive group of small coral islands, lying to the eastward of the Society islands, and southward from the Marquesas islands. This group or archipelago extends from 15° to 25° s. lat. and from 134° to 148° w. long. The navigation of this part of the ocean is, as may readily be supposed, dangerous. Some of the islands are in minor groups, others are quite solitary. The whole pop. is estimated at about 10,000.

LOW COUNTRIES. See NETHERLANDS, *ante*.

LOWE, Sir HUDSON, was b. at Galway, July 28, 1769. His childhood was spent in the West Indies, where his father held a military appointment. Lowe returned to England when in his twelfth year. Having entered the army, he served for some time in Corsica, subsequently at Lisbon and in Minorca. On the renewal of the French war, after the peace of Amiens, he was appointed to the chief military command in the island of Capri. He was here unsuccessful, being obliged to surrender to the French, Oct. 16, 1808. He served for some time in the n. of Europe, and in Germany under Blücher. On Aug. 23, 1815, he was appointed governor of St. Helena, with the rank of lieut.gen. Previous to leaving England he married, in Jan., 1816, Susan, widow of col. William Johnson. He arrived in St. Helena on April 14, 1816, Napoleon having been landed there on Oct. 17, of the previous year. It is impossible to conceive a situation in which the adequate discharge of a public duty more surely involved a heavy amount of private care and public obloquy than that which had fallen to Lowe. Had he for a single hour relaxed the necessary vigilance, his own impeachment and another European war might have been the consequence. On the other hand, the due exercise of this vigilance entailed upon him every kind of annoyance which the peevish and irritable captive had it in his power to give. Even were it true that he exercised a needless severity in guarding Napoleon, this might readily be excused when we consider how often it must have been utterly impossible for him to know what was unnecessary and what was not, and of how little consequence was the convenience of one man, who had already broken his parole, compared with the security of the whole world. On the death of Bonaparte Lowe returned to England, where his eminent services met with a very ungrateful return. In 1825 he was appointed military commander in Ceylon, from whence he returned to England in order to refute the charges brought against him by O'Meara and others. He died at London in very poor circumstances, in the 65th year of his age, Jan. 10, 1843.

LOWE, Right Hon. ROBERT, English politician, b. 1811, at the rectory of Bingham, Notts, of which parish his father, the rev. Robert Lowe, was rector. He was educated at Winchester, and University college, Oxford, where he was first-class in classics, and second-class in mathematics, 1833. He remained at Oxford, was elected fellow of Magdalen in 1835, devoted himself to tuition, and obtained the reputation of being one of the best private tutors in the university. In 1836 he married, and gave up his fellowship. He was called to the bar by the honorable society of Lincoln's Inn, in 1842, and went to Australia to push his fortune. He soon attained a lucrative practice at the Sydney bar. He also took a leading part in the political struggles of the colony. In 1843 he was nominated one of the legislative council. In 1848 he was elected member for Sydney. Some successful land speculations put him in possession of a moderate competency; and he returned to England, in 1850, with the design of entering upon a parliamentary career. Returned in 1852 for Kidderminster as an independent member with conservative tendencies, he, in 1853, took office under lord Aberdeen, as secretary to the board of control. He went out with lord Aberdeen's government, but in Aug., 1855, he accepted from lord Palmerston the post of vice-president of the board of trade. At the general election in Mar., 1857, he was invited to offer himself for Manchester, but he preferred to remain at Kidderminster. Here, however, he became unpopular with the working-classes. He gained his seat, but not without an election riot, in which he was severely injured. In 1859 he exchanged this turbulent constituency for the borough of Calne, where the influence of the marquis of Lansdowne procured his return. He sat for Calne till 1868, when, at the general election, he was returned for the London university, which he still (1879) represents. In June, 1859, he became virtual minister for

education in lord Palmerston's second administration; and he held this office until April, 1864, when the house of commons, on the motion of lord Salisbury, then lord R. Cecil, having condemned an alleged practice of the privy council office in tampering with the reports of the education inspectors, Lowe, unnecessarily, as it was thought, resigned office. The introduction of the revised code of 1860, with its principle of "payment by results," signalized his administration of the education department. Time has shown that this was a valuable reform, but it brought upon him much obloquy, which his personal characteristics by no means tended to avert or mitigate. His emancipation from the restraints of office exhibited Mr. Lowe in a new phase. No speaker, during the session of 1865, was so logical, so original, and so daring. In 1866, on the introduction of the whig reform bill, Lowe delivered the first of a series of powerful speeches, which largely contributed to insure its rejection. He was, with other members of what was called the party of "adullamites," offered a post in the Derby government, but he declined to leave the liberal party, though describing himself as an outcast from it. When the Derby government, in 1867, attempted to deal with the reform question, Lowe, in a series of speeches, vindicated his consistency as an opponent of all reduction of the suffrage. Circumstances had, however, changed, and the successful opponent of the comparatively moderate whig measure found himself almost alone in protesting against the establishment of household suffrage. In 1868 Lowe's feud with the liberal party was made up, or rather, was forgotten, in the strenuous aid he gave the liberal leaders in carrying resolutions in the house of commons for the disestablishment of the Irish church. Accordingly, in Dec. of that year, when a general election brought the liberal party into power, with Mr. Gladstone as prime-minister, Mr. Lowe obtained in the liberal ministry the office of chancellor of the exchequer. This post he filled till Sept., 1873, when he exchanged it for that of home secretary. He went out of office with the Gladstone government in Feb., 1874, when it became plain that the chances of a general election had given the conservatives a majority. He was home secretary for too short a period to test his fitness for that trying office. As chancellor of the exchequer, he was not deemed decidedly successful. The chief reforms effected by him during his tenure of office, were the substitution of license duties for the assessed taxes, a change in the time of collecting the income-tax, and in the assessment of that tax on small incomes, and a great reduction of the sugar duties. He did himself much harm with his first budget by proposing a tax on matches—a proposal easily put in ludicrous lights and which excited strong opposition. During his occupancy of this office, however, the annual surpluses were large almost beyond example. This was due partly to economical management, but much more to the prosperous state of the country. Lowe exerted himself earnestly to keep down the public expenditure. It was considered, however, that his regard for the public purse was pushed to the verge of parsimony, and of injustice to individuals; and his curt and ungracious treatment of all claimants of public money undoubtedly brought much odium upon himself and the government to which he belonged. Some faults of administration came to light in the later days of his administration, which were naturally made the most of. Lowe's oratory is deficient in passion; but in acuteness, in felicity of illustration, and in cogency of argument, he is almost unequaled among the public speakers of his day. His elocution is rapid, and his manner nervous and embarrassed; but his great intellectual power always commands the attention and admiration of the house of commons. Several collections of speeches and letters by him on public questions have appeared. As an educational reformer, he is an energetic opponent of the pre-eminence still allowed to the study of the classics. Lowe was made an honorary LL.D. by Edinburgh university in 1867, and D.C.L. by Oxford in 1870.

LÖWE, SOPHIE; 1815–66; a German singer who appeared in opera in Vienna in 1832, and made a great sensation, both by her superb voice and her showy beauty. She married prince Frederick of Lichtenstein in 1848, and retired from the stage.

LOW'ELL, a city of Massachusetts, on the Merrimac river, 25 m. n.w. of Boston. Here the Pawtucket falls, of 30 ft., afford water-power for the factories which have given to this town the name of the "Manchester of America." The canal is owned by a company, which erected extensive machine-shops, and has built the factories for 11 "corporations," manufacturing cotton goods, prints, woolens, carpets, etc., consuming 40,000,000 lbs. of cotton per annum. Lowell was incorporated in 1826. The operatives were for years gathered from the rural districts 50 or 100 m. around, and lived in boarding-houses built and owned by the corporations, and kept under strict management. Foreign emigration has brought a large resident manufacturiug population. Lowell has several banks, daily and weekly newspapers, literary institutions, about 30 churches, and extensive educational establishments. Pop. in '60, 36,827; in '70, 40,928.

LOWELL (*ante*), a city in n.e. Massachusetts, the terminus of the Boston and Lowell, the Nashua and Lowell, the Stony Brook, Lowell and Andover, and the Framingham and Lowell railroads; 2,587 acres; pop. '80, 59,485. It is one of the largest manufacturing cities in the United States, its industries having been the foundation and subsequent basis of its prosperity. Its natural advantages and facilities for the economical outlay of capital are unsurpassed, and the use made of them is unexampled. The Merrimac river,

near the mouth of the Concord river, furnishes its water-power, and affords a charming addition to the landscape as viewed from Belvidere, in the e. portion of the city, a quarter occupied by the wealthiest residents. Along the wide avenue leading from this suburb a view may be obtained of the broad, winding river, the great compactly built factories, like grim stone palaces, their windows refracting the sun's rays with a metallic luster or revealing the gaslight through myriads of starry panes, the busy toiling city below, and the White mountains gleaming through miles of misty distance, with Mt. Wachusett and the Monadnock in grand relief. It received its city charter in 1836, and is governed by a mayor, a board of aldermen of 8 members, and a common council of 24. It originally comprised the town of East Chelmsford, receiving subsequently parts of Dracut and Tewksbury. It is well paved, well drained, and well lighted with gas. It has a fine city hall, other public halls of convenient size, a city library of 17,000 volumes, a mechanics' library of 13,000, a court-house, 7 national banks with an aggregate capital of $2,350,000, 6 savings banks, 2 hospitals, 2 insurance companies, a Roman Catholic orphan asylum, an old ladies' home, a young women's home, a good fire department with an electric fire alarm, a well organized police force, and a horse railroad. It was named in honor of Francis C. Lowell of Boston. Its water-works, finished in 1873 and costing $1,500,000, supply it with pure water. The river at this point has a fall of 33 ft., and the water-power is owned by a company chartered in 1792, called the *Proprietors of the Locks and Canals on Merrimac River*, which purchased the canal privilege in 1821, adding to it and constructing another canal in 1847, the first cotton mill being erected in 1822. This company lease at the present time water-power equal to 10,000 horse-power for purposes of manufacture. Its water-power on the Concord river, leased by the Wamesit company is equal to 500 horse-power. The entire capital involved in its manufactures, and controlled by 12 companies, is estimated at $16,000,000, employing 16,000 operatives, of which 10,000 are females, producing 2,660,000 yds. of cotton weekly, of woolen cloth 60,000, carpeting 37,500. Number of shawls weekly, 2,500; dozens hosiery weekly, 16,800; lbs. of cotton consumed, 780,000; of clean wool, 152,500; yds. dyed and printed annually, 64,951,200. It has 80 mills, and over 678,521 spindles, looms 15,189, governed by 9 corporations, making use of 50 steam engines, of 6,188 horse-power in addition to the water-power. Among the largest corporations is the Merrimac manufacturing company having 5 mills and print works, running 158,464 spindles and 3,945 looms, employing 1800 females and 900 males. The consumption of cotton is 148,000 lbs. per week, making 830,000 yds. per week, and dyeing and printing 900,000 yds. Forty engines, equal to 3,800 horse-power, are used, and 6 turbine wheels to carry the water-power. Other corporations are the Lowell manufacturing company, the Tremont and Suffolk mills, the Lawrence manufacturing company, and the Massachusetts cotton mills; the smallest capital employed being $1,200,000, and the largest $2,500,000. They produce prints, drillings, cotton sheetings and shirtings, carpets (made by the Lowell manufacturing company), ingrain, Brussels, and Wilton, as beautiful and as durable as the best French and English make. They employ 1700 hands, 600 females in 1 spinning mill, 3 carpet mills, and 1 fine worsted mill; consuming 70,000 lbs. of wool and making 48,000 yds. of carpet per week, the machinery being run by a 450 horse-power Corliss engine. The buildings and property connected with these mills cover 10 acres. Other manufactures are serges, cassimeres, and beavers. The Lawrence company has 550 knitting machines, producing 12,000 doz. of cotton and merino hosiery weekly. The Appleton company added a new mill in '74. Each company owns the large boarding-houses, which are exhibited to the tourist as models, being built for the exclusive use of the operatives. They have also a hospital, where the sick operatives receive free attendance, if unable to pay. There are manufactories of edge tools, files, screws, machinery, boilers, fixed ammunition and cartridges, paper, hair felt, elastic goods, carriages, furniture, pumps, hydraulic presses, bobbins, and chemicals. Among its iron works are the Lowell machine shops, incorporated 1845, with a capital of $600,000, employing 1250 hands; the American bolt company, the Swaine turbine company, and R. Kitson's cotton machinery manufactory. Patent medicines are manufactured by Dr. J. C. Ayer & Co., printing 10,000,000 almanacs annually. The Lowell bleachery, with a capital of $300,000, employing 400 hands, dyeing 15,000,000 yds., and bleaching 10,000,000 lbs. annually. The city has beautiful public squares, and in the midst of the city's turmoil and traffic stands the monument to Ladd and Whitney, who were killed by a mob while marching through Baltimore with the 6th Mass. volunteer militia, April 19, 1861. The female operatives of its mills formerly supported a periodical called the *Lowell Offering*, famous as an exponent of the intelligence, thrift, and ambitious self-respect of the working-girl of Lowell.

LOWELL, CHARLES, D.D., 1782–1861; b. Boston; son of John (1743–1802); studied at Andover and graduated at Harvard in 1800; studied law and afterwards theology; spent some time abroad, studying for a while in Edinburgh; in 1806 was settled over the West church (Congregational) in Boston. When the controversy between the orthodox and the Unitarians arose, he refused to join either party, or to take a sectarian name, and did what he could to prevent a division. He was distinguished rather for benevolence and sweetness of heart than for learning. He published two volumes of sermons, besides several occasional discourses. He was the father of James Russell Lowell, poet and essayist, the present American minister at the British court.

LOWELL, CHARLES RUSSELL, 1835–64; b. Boston; son of Charles, D.D.; was a pupil of the Boston Latin school, and graduated with the highest honors at Harvard in 1854. He visited Europe, spending considerable time there in study and travel, and upon returning to the United States engaged in business. He left his position as superintendent of iron-works in Maryland to enlist in the war for the suppression of the rebellion. He served in the peninsular campaign as capt. of the 6th U. S. cavalry, and in n. Virginia and Maryland on the staff of gen. McClellan; was appointed col. of the 2d Massachusetts cavalry, and stationed for a time near Washington. He was next assigned to the command of a brigade, and rendered important service against Mosby's guerrilla bands, and in the resistance and pursuit of the confederate army under gen. Early from before Washington in 1864. He was with Sheridan in the Shenandoah valley, where his services were conspicuous and brilliant. Having been wounded early in the battle of Cedar creek, he refused to retire from the field, and in the moment of final victory received a hurt which proved mortal. As a recognition of his valor he was made brig. gen. of volunteers. Died at Middletown, Va.

LOWELL, FRANCIS CABOT, 1775–1817; b. Boston; son of John (1743–1802); graduated at Harvard in 1793; was a leading merchant in Boston, and among the first in the United States to engage in the cotton manufacture. The city of Lowell was named in his honor. Died in Boston.

LOWELL, JAMES RUSSELL, an American poet, was b. in Boston in 1819. He was educated at Harvard university. His *Legend of Brittany* appeared in 1844. In 1845 he published a prose work entitled *Conversations on some of the Old Poets.* His *Fable for Critics* and *The Biglow Papers* are racy with humor. In 1854 he succeeded Longfellow as professor of modern languages at Harvard; from 1857 to 1862, was editor of the *Atlantic Monthly,* and from 1863 to 1872 of the *North American Review.* He received the degree of LL.D. from the English university of Cambridge in 1874. In 1869 he published *Under the Willows, and other Poems,* and *The Cathedral,* an epic; in 1870, a collection of essays; and, in 1871, *My Study Windows.*

LOWELL, JAMES RUSSELL (*ante*), D.C.L., LL.D., graduated at Harvard law school in 1840, and for a short time practiced at the bar in Boston. He visited Europe in 1872, remaining two years, and was honored by being made the recipient in person of the degrees of D.C.L. at Oxford and LL.D. at Cambridge, England. After his return to America, Dr. Lowell took a warm interest in public affairs, and in 1876 was a delegate to the republican national convention. In June, 1877, he was appointed by president Hayes minister to the court of Spain, from which post he was transferred, in 1880, to the court of St. James; the appointment being received with signal expressions of gratification on the part of all classes of the British people, among whom Mr. Lowell's writings are even more popular than among his own countrymen. He married in 1844, MARIA WHITE, of Watertown, Mass. (1821–53), a gifted and accomplished woman. Besides translating with elegance and exactness from the German, she was the author of a number of poems of more than ordinary merit, a collection of which was privately printed in Cambridge, Mass. (1855), after her death. In her memory Longfellow wrote his beautiful poem entitled *Two Angels,* published in *Putnam's Monthly,* April, 1854:

'Twas at thy door, O friend, and not at mine,
The angel with the amaranthine wreath,
Pausing, descended, and, with voice divine,
Whisper'd a word that had a sound like death.

Then fell upon the house a sudden gloom,
A shadow on those features fair and thin,
And softly from that hush'd and darken'd room,
Two angels issued, where but one went in.

LOWELL, JOHN, LL.D., 1743–1802; b. at Newbury, Mass.; graduated at Harvard in 1760; was admitted to the bar in 1762, and in 1777 removed to Boston. He was a member of the continental congress in 1782–83; judge of the court of appeals from 1783 to 1789, of the U. S. district court from 1789 to 1801, and of the U. S. circuit court from 1801 till his death in 1802. The clause in the Massachusetts bill of rights which was interpreted as making slavery in that state illegal was written by him.

LOWELL, JOHN, LL.D., 1769–1840; son of John (1743–1802); b. at Newburyport, Mass.; graduated at Harvard in 1786; admitted to the bar in 1789; took up his residence in Boston, became eminent as a lawyer, and was an active, honored, and public-spirited citizen, but refused to take office. He was the author of many papers and pamphlets upon the current topics of his time.

LOWELL, JOHN, 1799–1836; b. Boston; son of Francis Cabot; educated at Harvard and Edinburgh; was a man of fine literary attainments and scholarly tastes; spent much time in foreign travel, and died at Bombay, India, leaving by will a legacy of $250,000 to found in Boston the "Lowell institute," which provides annually for free courses of lectures upon important subjects. This lectureship has supplied a platform for some of the most learned and vigorous thought of the eastern section of the United States.

LOWELL, MARY. See PUTNAM, MARY LOWELL.

LOWELL, ROBERT TRAILL SPENCE, D.D., b. Mass., 1816; educated at Harvard; in 1842 ordained in the church of England; and settled at Bay Robert, Newfoundland; Newark, N. J.; and Duanesburg, N. Y. He was for a time principal of St. Mark's school, Southborough, Mass., and in 1873 became professor of Latin in Union college. He has published *Fresh Hearts and other Poems; The New Priest of Conception Bay; Anthony Brade;* and *A Story or Two from an old Dutch Town.* He is a brother of James Russell Lowell.

LO'WENTHAL, ISIDOR, 1827–64; b. Posen, Prussian Poland, of Jewish parents; acquired the Hebrew language at an early age, exhibiting an extraordinary aptitude for philological studies. At 17 years of age, without having been to college, he had more than mastered the studies embraced in the college curriculum. He then accepted a mercantile clerkship, intending apparently to devote himself to a business life. He was a radical in politics and member of a liberal club, and a poem which he published in a newspaper having excited the attention of the government, he was constrained to flee to America. Reaching New York in the autumn of 1846, he was shortly afterward reduced to the necessity of becoming a street peddler in order to earn his bread. In these circumstances he found a friend in the Rev. S. M. Gayley, of Wilmington, Del., by whose means he gained a position as teacher of German and French in Lafayette college, Easton, Penn. While thus engaged he joined the senior class in the college and graduated in 1848. After this he became teacher of languages in the collegiate school at Mt. Holly, N. J. In 1851 he became a Christian, and in 1852 entered the theological seminary at Princeton, where he took high rank in philology, and wrote several important articles for the *Biblical Repertory.* In 1855 he became a tutor in the college at Princeton, but in 1856 he accepted from the Presbyterian board of foreign missions an appointment as missionary to the Afghans of India. On his arrival in that country he set himself to the task of learning Persian, Cashmiri, Hindustanee, Arabic, and the Afghan languages, and translated into the latter the whole of the New Testament. He had nearly completed a dictionary of that language when he was accidentally killed at Peshawar, a death which was an incalculable loss to missions in the East Indies.

LÖWENTHAL, JOHN JACOB, b. Buda-Pesth, Hungary, 1810; in 1841 was recognized as one of the best chess-players in Europe, and thenceforth was generally the victor in matches with the most renowned masters of the game. In 1849 he was constrained, for political reasons, to leave Hungary, and came to the United States, where he interested himself in his favorite game. In 1851 he went to London to engage in a chess tournament, and became a resident of that city, where he was employed in editing the chess department of several public journals. He also edited the *Chess-players' Magazine,* 1865–67, and superintended the publication of several books on the same subject. He was also for a time secretary of the St. George's and president of the St. James's club. In 1867–69 he published *Transactions of the British Chess Association.*

LOWER, RICHARD, b. Cornwall, 17th c.; educated at Westminster school and Christ church, Oxford; studied medicine under Dr. Thomas Willis. In 1674, in connection with Dr. Willis, he discovered the medicinal waters at Ashop, in Northamptonshire, which on their recommendation, became much frequented. In 1666 he went to London, practiced medicine, and became a fellow of the royal society and of the college of physicians. In 1669 he published his *Tractatus de Corde.* After Dr. Willis's death in 1675, he was at the head of the profession in London.

LOWER EMPIRE. See BYZANTINE EMPIRE, *ante.*

LO'WESTOFT, a seaport and bathing-place in the county of Suffolk, is situated on a height sloping gradually to the sea, 25 m. s.e. of Norwich. There are here two lighthouses, one on the height or cliff, the other to the s. of the town, in a lower locality. A profitable fishery is carried on; soles, mackerel, and herrings being caught in great numbers. The harbor of Lowestoft is spacious. Ropes and twine are manufactured. Pop. '71, 15,246. Lowestoft is the most easterly town of England.

LOWICZ. See LOVICZ, *ante.*

LOWNDES, a co. in s. Alabama, intersected in the e. section by the Mobile and Montgomery railroad, and the Western railroad of Alabama; 900 sq.m.; pop. '80, 31,178—31,099 of American birth, 25,540 colored. It has the Alabama river for its n. boundary, and is drained by a few small creeks. Its surface is slightly undulating and well wooded. It has a fertile soil adapted to the raising of live-stock, barley, oats, corn, cotton, sweet potatoes, and to the production of wool, honey, and sugar-cane. Cash value of farms in 1870, $2,271,911, numbering 954. Seat of justice, Hayneville.

LOWNDES, a co. in s. Georgia, having the state line of Georgia for its s. boundary; bounded on the n.e. by the Allapaha river, and on the s.e. by one of its branches; 550 sq.m.: pop. '80, 11,049—11,027 of American birth, 5,637 colored. It is bounded on the s.w. by the Little river, and the Ocopilco river; is watered by other small streams emptying into the Suwanee river; and is intersected centrally by the Savannah, Florida and Western railway. Its surface is generally level and sandy. It is covered to a great extent by forests of building timber. Its soil in some localities is fertile, and adapted to stock-raising and the production of cotton, wool, sweet potatoes, sugar-cane, rice, oats,

corn, rye, and the products of the dairy. It produced in 1870, 3,600 lbs. of honey. Its water power is utilized to some extent. Seat of justice, Valdosta.

LOWNDES, a co. in e. Mississippi, having the state line of Alabama for its e. boundary, intersected by the Mobile and Ohio railroad very near the w. border, with a branch from Artesia to Columbus; 500 sq.m.; pop. '80, 28,243—28,083 of American birth. It is drained by the Tombigbee river, navigable as far as Columbus, and the Oktibbeha river flowing from the n.w. and crossing the state line to unite with the Alabama river. Its surface is generally level, and has an extensive growth of pine and oak timber, with groves of cypress, elm, and hickory. Its soil is a fertile sandy loam, well adapted to stock-raising and particularly productive on the level river banks. Products are oats, corn, cotton, wheat, wool, and sweet potatoes. Cash value of farms in 1870, $2,079,973, numbering 805. It had in 1870, 75 manufacturing establishments, employing 368 hands, with a capital of $376,007, and an annual product of $412,097. Flour is manufactured, also woolen goods, tin, copper, and sheet-iron ware. Seat of justice, Columbus.

LOWNDES, RAWLINS, 1722–1800; b. West Indies; whence his parents removed to Charleston, S. C., where he rose to eminence at the bar, and in 1766 was made a judge by the crown; in this capacity affirming, with the majority of his court, against the dissenting opinion of the chief-justice, the validity of unstamped public papers. In the dispute between England and the colony, he was strongly committed to the cause of the latter, and while serving in the colonial assembly in 1768, he proposed the erection of a statue to William Pitt, as a mark of gratitude for his services in behalf of the colonies. In 1775 Lowndes was a member of the committee of public safety, and the next year of the committee charged with drawing up a new constitution for the province, of whose council he became a member. He was elected president of the province, and during his term of office sir Henry Clinton laid siege to Charleston with 12,000 regular troops, and in spite of the efforts of Lowndes, it was captured May 12, 1780. After the close of the war he again entered the legislature, and in the debates upon the adoption of the federal constitution, he was among the bitterest opponents of that instrument, saying in one of his speeches: "I wish no other epitaph then this 'Here lies one who opposed the federal constitution, holding it to be fatal to the liberties of his country.'"

LOWNDES, WILLIAM JONES, LL.D., 1782–1822; b. S. C.; son of Rawlins. His preliminary education was obtained in England, after which he graduated at Charleston college, and entered the bar. After serving four years in the state legislature, in 1810 he was elected to congress, to which he was returned by successive re-elections till his death. He was a republican in his politics according to the party division of his times, and chairman of the ways and means committee, 1818–22.

LOWNDES, WILLIAM THOMAS, 1800–43; b. England, where he carried on the trade of a bookseller. He was an enthusiastic bibliographer, and published two books of standard authority in their department; *The Bibliographer's Manual of English Literature*, 4 vols., 1834; and *The British Librarian or Book Collector's Guide*, 1839. But 11 parts of the latter had been completed when the author succumbed to insanity brought on by pecuniary difficulties.

LOWRIE, WALTER, 1784–1868; b. Edinburgh, Scotland; removed with his parents in 1791 to Huntingdon co., Penn., but soon went to Butler co., which they made their permanent residence. He grew up on his father's farm, and his early education was limited, though his religious training was thorough. At the age of eighteen, he entered upon a course of study with the ministry in view. He studied Latin, Greek, and Hebrew, with great diligence and success. Providential circumstances compelled him to abandon his purpose, and he entered upon other pursuits. Having won the confidence and esteem of the community in which he lived, he was in 1811, at the age of 27, elected to the senate of Pennsylvania, and after serving the state in this office for seven years, he was sent to the senate of the United States. His term of service expiring in 1824, he was made secretary of the senate, and held the office 12 years. This he might have held for life, as others had done, and many members of the senate without distinction of party urged him to retain the place. In the senate were Webster, Clay, Calhoun, Randolph, Benton, and other illustrious men, when the measure known as the *Missouri Compromise* was earnestly discussed. Among these was Lowrie, whose integrity won their confidence, while his sagacity and practical judgment led them to seek his advice and rely upon his opinions. One who was present at the time has said that he was regarded by the senators who knew him best as an authority upon all questions of political history and constitutional law. His religious influence in congress was great. He with Frelinghuysen and others founded the congressional prayer-meeting, and was one of the founders of the congressional total-abstinence society. In 1836 he was elected corresponding secretary of the Western foreign missionary society, and in 1837 of the board of foreign missions of the Presbyterian church, which office he held for 32 years. While in the senate he was a member of the committee on Indian affairs, and became deeply interested in the fate and evangelization of the tribes, whom when secretary he visited, and whose interests he zealously and wisely labored to promote. Mr. Lowrie's oldest son John, who succeeded his father as secretary, and now occupies that position, was three years a missionary in India. His third son Walter was a missionary for five years in China, and

was thrown into the sea by pirates. His fourth, Reuben was also in China, and after six years' labor fell a sacrifice to constant work and the enervating effect of the climate.

LOWTH, ROBERT, D.D., an English prelate, son of the rev. William Lowth, rector of Buriton, in Hampshire, was b. Nov. 27, 1710. He was educated at Winchester school, whence, with a reputation both as a scholar and poet, he passed to New college, Oxford, in 1730. Here he continued to distinguish himself, took his degree of M.A. in 1737, and only four years after, was appointed professor of poetry. In 1750 bishop Hoadley conferred on him the archdeaconry of Winchester, and in 1753 the rectory of East Woodhay, in Hampshire. During the same year, he published in Latin his excellent *Lectures on Hebrew Poetry* (*De Sacra Poesi Hebræorum Prælectiones Academicæ*). It was greatly admired both in England and on the continent, where the celebrated Michaelis republished it with notes and emendations. These were incorporated by Lowth himself in a second edition, 1763. A new edition was published by Rosenmüller (Leip. 1815). In 1754 Lowth received from the university of Oxford the degree of D.D., became prebendary of Durham and rector of Sedgefield in 1755, a fellow of the royal societies of London and Göttingen in 1765, bishop of St. Davids in 1766, of Oxford a few months after, of London in 1777, and died Nov. 3. 1787. Besides his lectures, his two principal works are *Life of William of Wykeham* (1758) and *Isaiah, a New Translation, with a Preliminary Dissertation, and Notes, Critical Philological, and Explanatory* (1778; German edition, by Koppe, Gött. 1779; third edition in English, 1842); a work rather too elegant and ornate as a version, but of great value as a means of correcting the numerous blunders of the "authorized version," and of exhibiting how thoroughly literary and artistic is that section of Hebrew poetry which we call prophecy.

LOXA. See LOJA, *ante*.

LOXODON, a genus of elephants of which the present African elephant is the type, and proposed by F. Cuvier, because he thought the differences between the only living species, African and Asiatic, are more than those which should separate mere species of one genus. The name loxidon refers to the lozenge-shaped lamellæ seen upon the grinding surfaces of the molar teeth, the structure being intermediate between that found in the molars of the Indian elephant and that found in the molars of the extinct genus *stegodon* of the upper miocene formation of India.

LOXODRO'MIC LINES (Gr. *loxos*, oblique, and *dromos*, course) are curves of double curvature on the surface of a sphere or spheroid, which have the property of cutting all meridians at the same angle. The course of a ship which is sailing in an oblique direction always to one point of the compass, is a loxodromic line, or, in nautical phrase, a *rhumb line*. These lines appear as straight lines on *Mercator's Projection* (see MAP). A ship sailing obliquely to the direction of the north pole (say, two points off) would wind round it in infinite circuits, always approaching nearer, but never reaching it. In this property, as well as in others, the loxodromic line is analogous to the common logarithmic spiral.

LOYO'LA, IGNATIUS DE (IÑIGO LOPEZ DE RECALDE), the youngest son of Bertram de Loyola and Marina Salez de Baldi, was b. in the year 1491 at his ancestral castle of Loyola, in the Basque provinces. After the scant training of that age in letters he was received as a page in the court of Ferdinand; but the restraint and inactivity of court-life were distasteful to his enthusiastic mind, and, under the auspices of his relative, Don Antonio Manriquez, duke of Najura, he embraced the profession of arms. The details of his career as a soldier are of little importance in his history, although they display in a very marked way both the excellency and the irregularities of his ardent temperament, thrown undirected among the temptations as well as the duties of a military life. Of his bravery and chivalrous spirit many remarkable instances are recorded, and one of these proved the turning-point of his career. In the defense of Pampeluna he was severely wounded in both legs, one being fractured by a cannon-ball, and the other injured by a splinter, and having been taken prisoner by the French, was by them conveyed to his paternal castle of Loyola, where he was doomed to a long and painful confinement. After a very painful operation, the results of which had well-nigh proved fatal, he eventually recovered; and with his returning strength he appears to have resumed his old thoughts and his habitual levity, for, in order to remove a deformity which had resulted from the first setting of his wounded limb, he consented to the painful remedy of having it re-broken in order to be reset. After this operation his convalescence was even more slow; and the stock of romances, by which he was wont to relieve the tedium of confinement, having been exhausted, he was thrown upon the only other available reading, that of the *Lives of the Saints*. The result was what might be expected in so ardent a temperament—the creation of a spiritual enthusiasm equally intense in degree, although in kind very different from that by which he had hitherto been drawn to feats of chivalry. The spiritual glories of St. Francis or St. Dominic now took, in his aspirations, the place which had been before held by the knights of mediæval romance. With souls like his there is no middle course: he threw himself, with all the fire of his temperament, upon the new aspirations which these thoughts engendered. Renouncing the pursuit of arms, and with it all other worldly plans, he tore himself from home and friends, and resolved to prepare himself for the new course

which he contemplated by a pilgrimage to Jerusalem. With a view to his immediate preparation for this holy task he retired in the garb of a beggar to the celebrated monastery of Montserrat, where, on the vigil of the feast of the annunciation, in 1522, he hung up his arms, as at once a votive offering significative of his renunciation of the works of the flesh, and an emblem of his entire devotion to the spiritual warfare to which he was from that moment vowed. From Montserrat he set out barefooted on his pilgrimage, the first step of which was a voluntary engagement which he undertook to serve the poor and sick in the hospital of the neighboring town of Manresa. There his zeal and devotion attracted such notice that he withdrew to a solitary cavern in the vicinity, where he pursued alone his course of self-prescribed austerity, until he was carried back, utterly exhausted, to the hospital in which he had before served. To this physical exhaustion succeeded a state of mental depression, amounting almost to despair, from which, however, he arose with spiritual powers renewed and invigorated by the very struggle. From Manresa he repaired by Barcelona to Rome, whence, after receiving the papal benediction from Adrian VI., he proceeded on foot, and as a mendicant, to Venice, and there embarked for Cyprus and the Holy Land. He would gladly have remained at Jerusalem, and devoted himself to the propagation of the gospel, among the infidels; but not being encouraged in this design by the local authorities, he returned to Venice and Barcelona in 1524. Taught by his first failure he now resolved to prepare himself by study for the work of religious teaching, and with this view was not ashamed to return, at the age of 33, to the study of the very rudiments of grammar. He followed up these elementary studies by a further course, first at the new university of Alcala, and afterwards at Salamanca, in both which places, however, he incurred the censure of the authorities by some unauthorized attempts at religious teaching in public, and eventually he was induced to repair to Paris for the completion of the studies thus repeatedly interrupted. Here again he continued persistently to struggle on without any resources but those which he drew from the charity of the faithful; and here again he returned to the same humble elementary studies. It was while engaged in these studies, and among the companions of them, that he first formed the pious fraternity which resulted in that great organization which has exercised such influence upon the religious, moral, and social condition of the modern world. From the close of his residence in Paris, Loyola's history has been told in the history of his order. See JESUITS. From the date of his election as the first general of his society, he continued to reside in Rome. To him are due not alone in the general spirit, but even in most of their details, all its rules and constitutions; from him also originated several works of general charity and benevolence, the germs of great institutions still maintained in Rome; but the great source of his influence upon the spiritual interests of the world is his well-known *Exercitia Spiritualia*, of which an account has been already given. He died at Rome, it may well be believed, prematurely, being worn out by his long-continued austerities, July 31, 1556. His name was admitted to what is known in the church of Rome as the preliminary step of beatification, in the year 1609, and he was solemnly canonized as a saint by Gregory XV. in 1622. His life has been written in almost every European language. The biographies of Ribadaneira, of Maffei, of Bartoli, and Bouhours are the best known and the most popular among Roman Catholics.

LOYSON, CHARLES (monastic name, FATHER HYACINTHE), b. at Orleans, Mar. 10, 1827. He studied at St. Sulpice, and after becoming priest taught philosophy and theology at Avignon and Nantes. Subsequently entering the order of the Carmelites, he became known as a powerful preacher, and gathered crowded and enthusiastic audiences of all ranks of society to the Madeleine and Notre Dame in Paris. Almost as remarkable as his eloquence was the boldness with which he denounced existing abuses in the church; and the archbishop Darboy defended him against the accusations of the Jesuits till, in 1869, the general of his order imposed silence on him. Loyson replied by a letter in which he called for a thorough reform of the church, and was excommunicated. Relieved from monastic vows by the pope, he became a secular priest under the name of the abbé Loyson. He protested vigorously against the infallibility dogma; but although he attended the "old Catholic" congress at Munich, and on visits to the United States and England fraternized with Protestants, he always declared his intention to remain in the Catholic church, trying to obtain reforms, such as the liberty of marriage for the clergy. In 1872 he married an English wife. In 1873 he was chosen curé of a congregation of liberal Catholics at Geneva, but soon left them, finding them to be "neither liberal in politics nor Catholic in religion." He has published a number of sermons and lectures, some of them in English.

LOYSON, CHARLES (*ante*), PÈRE HYACINTHE, b. France, 1827, was educated at Pau and in the theological school of St. Sulpice until the age of 22, when he became a priest. After ten years of priesthood and two of novitiate in the Carmelite convent in Lyons, he joined that order. He preached in Bordeaux and other French cities, attracting general public attention by his eloquence and enthusiasm, and in the summer of 1865 at the Madeleine and at Notre Dame in Paris. Having become notorious for the enunciation of sentiments more liberal than the doctrines of the church permitted, he was obliged to explain his orthodoxy before the pope. He succeeded in clearing himself temporarily, but again employed language which was considered subversive of church

discipline, and he was threatened with the major excommunication and forbidden to preach in Notre Dame. In a letter which Loyson addressed to the general of the barefooted Carmelites at Rome he wrote: "It is my profound conviction that if France in particular and the Latin races in general are given up to social, moral, and religious anarchy, the principal cause is not Catholicism itself, but the manner in which Catholicism has for a long time been understood and practiced." As this statement, which was made public, was an attack on the alleged abuses in the church, it produced a profound sensation, and tended to connect the author with the antagonists of the papacy In the autumn of 1869, the year of his enunciation of the new conclusions which he had reached, Loyson paid a visit to America, and was warmly welcomed by distinguished Protestants and liberal Roman Catholics in the United States. In the following year he was released from his monastic vows by the pope, and soon after preached in Rome. On Sept. 2, 1872, he was married in London to Mrs. Emily Jane Meriman, the widow of an American gentleman. The abbé Loyson was elected curé of Geneva, but resigned in 1874. He delivered lectures in London in 1876, and a translation by his wife of some of his letters, fragments, and discourses was published in London in 1874.

LOZENGE, in heraldry, a charge generally enumerated among the sub-ordinaries, in the shape of a rhombus placed with the acute angles at top and bottom. The horizontal diameter must be at least equal to the sides, otherwise it is not a lozenge, but a fusil (q.v.). The term *lozengy* is applied to a field divided by diagonal lines crossing one another at regular intervals so as to form a diamond pattern, the compartments being of alternate tinctures.

LOZENGES are employed in medical practice in those cases in which it is desired that the remedy should pass gradually into the stomach, in order to act as much and as long as possible upon the pharynx and the laryngeal opening; as, for example, in cases of relaxed or inflamed states of the tonsils and uvula, in chronic coughs, etc. According to Dr. Paris (*Pharmacologia*, 9th ed. p. 555), lozenges should be composed of several demulcent substances, such as farinaceous matter, sugar, gum, and isinglass, since such a mixture retards as long as possible their solution. Lozenges are flat and circular or oval in form, and the chief difference between lozenges and the closely allied substances known as *drops*, is that in the latter the sugar is rendered fluid by means of heat, while in the former the ingredients are combined without the aid of heat.

LOZÈRE, a department in the s. of France, derives its name from mount Lozère, one of the summits of the Cevennes (q.v.), and is formed out of the province of Languedoc. It comprises the arrondissements of Mende, Florac, and Marvejols. Area, 1990 sq.m.; pop. '76, 138,319, among whom are many Protestants. The department is mountainous, the central mass of the Cevennes, here called the Margeride mountains, occupying the whole of the e. and s.e. portions. In the mountains the climate is severe and variable, and little grain is produced; but the slopes on the southern side of the Cevennes, looking towards the valley of the Rhone, are clothed with the mulberry, the olive, and the vine. Wolves abound in the forests, which are extensive. Cattle, sheep, and mules are reared and exported in considerable numbers; but the real prosperity of the department arises from its mines, which yield iron, antimony, lead, copper, silver, and some gold. Capital, Mende.

LUALABA RIVER. See CONGO, *ante*.

LUBBOCK, Sir JOHN, b. England, 1834; son of John William, who took him into partnership in his bank in London in 1856, and upon whose death, in 1865, sir John succeeded to the baronetcy. He was a member of the international coinage commission, the public school commission, and the advancement of science commission. In 1870 he was returned to parliament, and re-elected in 1874 and again in 1880. In parliament he carried through a number of important measures, such as the falsification of accounts bill, the bank holidays act, and the absconding debtors act. But he has most distinguished himself by his inquiries into the condition of ancient man, and his writing on zoological subjects. Sir John has published *Prehistoric Times; Origin of Civilization; British Wild Flowers; Origin and Metamorphoses of Insects; Scientific Lectures; Monograph of the Thysanura and Collembola;* and a volume of political and educational addresses. He is a fellow of the royal, Linnæan, and many other learned societies.

LUBBOCK, Sir JOHN WILLIAM, 1803-65; b. England, educated at Cambridge, and succeeded to the baronetcy in 1840. He devoted himself to astronomical research, and contributed many papers to the proceedings of the royal astronomical society and the royal society, of which latter he was elected a fellow at the age of 26. A series of his papers in the *Philosophical Transactions* was published in 1833, in book form, under the name, *On the Theory of the Moon*, and other papers were separately issued as tracts, such as an *Elementary Treatise on the Tides* and *Classification of the Different Branches of Human Knowledge*. He also pursued investigations into the theory of mathematical notation and meteorology.

LÜ'BECK, one of the three remaining free cities of Germany, is situated on the river Trave, about 40 m. n.e. of Hamburg, and 14 from the Baltic. It is built on a rising ground, and its appearance with its walls and ramparts still partly standing, its great gates, its proud towers, its Gothic churches, and its antique gabled houses is still almost

mediæval. Its principal buildings are St. Mary's church (*Die Marienkirche*), one of the most beautiful specimens of Gothic architecture in the n. of Europe, finished in 1304, with three naves, the central one 119 ft. in length, and two towers, 382 ft. high; the town-house, containing the Hanseatic archives and a public library of 50,000 volumes, built of red and black glazed tiles; the cathedral, built 1170–1341; the monastery church, also a masterpiece of Gothic; the exchange, and the banks. Lübeck is rich in educational establishments of all kinds, religious and secular—the number within the city amounting to 54, while in the suburbs there are no less than 37, in all 91. The provision for the poor is excellent, on account of the large bequests that citizens have made at different periods for this purpose, the largest benevolent institution being the hospital of the Holy Ghost. The industrial activity of Lübeck is considerable. Ship-building and engineering are carried on; there are also many breweries and important cigar-manufactories; yet in the old days when the Hanseatic league was flourishing, the Merchant company or college could reckon 5,000 members, while in 1859 it had only 471. The fisheries of Lübeck are important and prosperous. The chief imports are wine, silks, cottons, earthenware, pigments, colonial products, and timber from Sweden and Finland; the chief exports are grain, cattle, iron, and wool. The harbor lies 16 or 17 m. down the river, at Travemünde, a bathing-place, although the river has of late years been so much deepened that the largest ships can come up to Lübeck. The income of the city and territory in 1879 was £129,980; the public debt, £1,190,200. In 1878, 2,302 vessels, of 301,910 tons, entered the port of Lübeck, and 2,332, of 307,557 tons, cleared. Pop. of town and suburbs, in 1875, 44,799; of the territory, 56,912.

Lübeck has existed since the 11th c., and received important privileges from the German emperors in the 12th c., which were confirmed by the Danes, into whose power it fell in 1201. It was declared a free city of the empire in 1226, and thereafter maintained its independence against the Danes, and joined the other commercial towns in the great Hanseatic league (q.v.). With the decline of the Hanseatic league, Lübeck lost its historic importance, but continued a flourishing and independent commercial city, till it was taken and plundered by the French, Nov. 6, 1806. Its trade suffered also grievously from the French continental system. In 1810 it was incorporated with the French empire. It recovered its independence in 1813, and is now a member of the German empire. Its trade has also revived; and the railway connection with Hamburg, and lines of steamers to ports of the Baltic, have contributed much to the increase of its prosperity. It possesses a territory 109 sq.m. in extent.

Constitution.—The constitution, which was anciently aristocratic, has been democratic since 1669. The government is intrusted to a senate, which consisted, till 1851, of twenty members; but since that year, of only fourteen, who, in legislative and also in certain administrative functions, require the concurrence of the municipality or council of citizens, a body comprising 120 members. The supreme court of appeal for the free cities was in Lübeck till 1879, when the imperial courts became supreme; and Lübeck law (*Lübisches Recht*) is of acknowledged authority in many questions.

LÜBKE, WILHELM, b. Westphalia, 1826; professor of architecture at Berlin, of archæology at Zürich, and since 1866 of the history of art at Stuttgart. Among his works are an *Introduction to the History of Ecclesiastical Art in the Middle Ages; Mediæval Art in Westphalia; History of Architecture; Studies in the History of Art;* and *An Outline of the History of Architecture,* which has been translated into English by Clarence Cook.

LUBLIN, a government of Russia, in Poland, comprising the circles of Lublin, Chelm, Josefow, and Zamoski, formerly belonging to Galicia, and ceded by Austria in 1810 to what was then the duchy of Warsaw. It lies between 50° 17′ and 51° 43′ n. lat., and 21° 45′ and 24° 7′ e. long.; 11,975 sq.m.; pop. 738,426. On the n. it has Podlachia, on the e. Volhynia, Galicia on the s., and on the w. Sandomir, from which it is separated by the Vistula; the river Bug dividing it from Volhynia, and the Wieprz from Podlachia. It is heavily wooded and has extensive morasses; but there are tracts of good arable land and excellent pasturage, with a fine breed of cattle. The only metal found is bog-iron. Capital, Lublin.

LUB'LIN, the capital of the Polish government of the same name, on the left bank of the Bistritz, a feeder of the Wieprz, a branch of the Vistula, is 96 m. s.e. of Warsaw. Lublin dates from the 10th c., and among the objects of interest which it presents to tourists, the church of St. Nicholas (founded in 986 A.D.) and the ruins of a royal castle are worth notice. It was formerly fortified. The chief buildings are the town-hall, the Sobieski palace, cathedral, Jews' synagogue, Piarist college, and several schools and hospitals. It has several manufactories of woolen and linen goods, in which as well as in corn and Hungarian wine it carries on an extensive trade. Pop. '67, 20,789. Three large fairs, each lasting one month, are held here annually.

LUBRICATION, the application of a substance to a surface for the purpose of making it smooth. This substance, which is called a lubricant, may be either a liquid, a semi-liquid, or a solid. Plumbago, or black-lead, is in most common use as a solid lubricant, but powdered soap-stone, or talc, is used for many purposes, as, for instance, by shoemakers upon the inside of the heels of boots and shoes to facilitate the pulling on. When it is desired to have a rope or cord slip over a bearing, as a pin, or a pulley which refuses to turn, it is usual to smear it with lard. Grease is the common lubricant,

but for machinery, or the bearing of axles generally, other substances may be added which will materially reduce the friction. Mineral oils, particularly the thicker portions of petroleum, have valuable lubricating properties, and may be used either alone or added to lard, tallow, or animal oils, according to the size, weight, and velocity of the revolving shaft. Oils are used for high speed; pasty lubricants for large and heavy bearings. There are a great variety of lubricants used for the axles of common road carriages, many of them patented. Perhaps the most favorite lubricant for light, fine road carriages, which are furnished with tight boxes, is castor oil. When the box is not very tight, a mixture of lard and rye flour may be used with advantage. It has the property of lasting, when mixed in the proportion of about 4 parts of grease to one of flour. Black-lead may be used in combination with lard and flour, or it may alone be mixed with lard or oil. Some vehicles are made with wooden axles, and for these common pine tar is an economical, lasting, preservative, and efficient lubricant. Its application may be alternated with lard, or a mixture of lard and tallow, or lard, tallow, and flour; but it is well to have some tar always present. Wherever great delicacy of motion is required, as in watches and other time-pieces, the lubricant must be very fluid. The lubrication may be performed by manual application, or mechanical devices may be employed. There are many kinds of lubricators. They are in the form of reservoirs, which discharge their contents, the lubricants, as fast as they are consumed by the revolving shaft or piece of moving machinery. A simple and often a very efficient lubricator is an inverted oil-can suspended over the bearing or place which requires lubrication. When a pasty lubricant is used, it may be applied on a sponge or brush, if the situation favor such application. The ingenuity of the operator is often advantageously exercised as well as that of the inventor.

LUCA GIORDANO. See GIORDANO, *ante*.

LUCAN, GEORGE CHARLES BINGHAM, Earl of, 1800; b. England. After passing through Westminster school, he entered the army, and took part as a volunteer with the Russian forces in the Turkish campaign of 1828. He was a conservative member of parliament for county Mayo, 1826–30, and was elected a representative peer for Ireland in 1840. He served through the Crimean war, and participated in the battles of the Alma, Balaklava, and Inkermann. He was made lieut.-gen. in 1858, and gen. 1865.

LUCA'NIA, a district of s. Italy, or Magna Grecia, extending from the Tyrrhenian sea on the w. to the gulf of Tarentum on the e.; bounded s. by Bruttium, n. by Apulia and Samnium, n.w. by Campania. With the exception of an extensive plain between the Apennines and the gulf of Tarentum, Lucania is mountainous. It was one of the wildest parts of Italy, and sent from its mountain forests wild swine for the amphitheaters of Rome. Its chief rivers were the Silarus (*Selè*), the Aciris (*Agri*), Bradanus (*Bradano*), Siris (*Sinno*), Sybaris (*Cosile*), besides many other streams. The principal cities were Sybaris, Heraclea, Metapontum, and Thurium on the e. coast; Pæstum and Elea or Velia on the coast of the Tyrrhene sea; Pandosia and Potentia in the interior. The original inhabitants of Lucania were the Chones and Œnotrians; who were gradually subdued by the Samnites from the n., B.C. 300. A league was formed against Lucania by the cities of Magna Grecia about 393 B.C., and a great battle fought in 390, when the Lucanians were victorious. In 272 they were subdued by the Romans. The territory of Lucania forms chiefly the modern provinces of Basilicata and Principato.

LUCA'NUS, M. ANNÆUS, the chief Roman poet of the silver age, was b. at Corduba (the modern *Cordova*), in Spain, 38 A.D., and brought to Rome in his infancy by his father, who was a younger brother of the philosopher Seneca. He received an education of the best kind, was a school-fellow of Persius, and a friend of the emperor Nero, and entered on life with the most brilliant prospects. He became quæstor and augur, and declaimed and recited in public with the highest applause. But his prosperity and himself were equally short-lived. He lost the favor of Nero, who was jealous of his poetry and his fame, and who desired to keep down both. Under the sting of this annoyance, he joined the conspiracy against Nero's life in 65 A.D. It is painful to read in Tacitus, that when arrested with others after the betrayal of the plot, he tried to save his life by accusing his mother of complicity. But the emperor did not spare him for the sake of this additional crime; he was compelled to destroy himself by having his veins opened, and he died in this way, and with a certain ambitious composure, at 27 years of age. Whatever the faults of Lucanus's character—and in the brief notices we have of him, both his vanity and levity are apparent—he holds a conspicuous place among the poets of Rome. The only work of his that has come down is the *Pharsalia*, an epic, in 10 books, on the civil war between Cæsar and Pompey. As an epic, it is, as Niebuhr somewhat quaintly says, an "unfortunate" performance, for it proceeds in the manner of annals, and wants the comprehensiveness, unity, and learning of the greatest works of its class. Nor is its style, generally speaking, good, for it is often turgid and obscure, and marked with those defects of taste which belong to poems inspired by a rhetorical age and school of writing. But when every deduction has been made, the *Pharsalia* affords ample proof that Lucanus was a man of real and powerful genius. There is an eye for the sublime both in the moral and physical worlds, constantly present in it; there is all the vigor of poetic oratory in its declamations; and there are felicities of epigram

which have secured to many a line a constant freshness of life, as part of the familiarly remembered literature of the world. Lucanus was very popular in the middle ages; and in modern times, his poem has been a particular favorite among the lovers of political freedom—especially among that school of classical republicans now nearly extinct in Europe, after having played a most important part in it. There is a well-known English translation of Lucanus by Rowe, which Dr. Johnson thought one of the best translations in the language.

LUCANUS AND LUCANIDÆ. See STAG BEETLE.

LUCARIS, CYRIL, a Greek theologian, was b. in the island of Candia in 1572, studied first at Venice, and afterwards at Padua, and subsequently visited Germany, where he formed intimate relations with the Protestant doctors, and carried back into Greece their spirit and their dogmas. Ordained a priest, he rose, in the course of years, to the highest dignity in the Greek church, being elected patriarch of Constantinople in 1621. He still cherished his Protestant opinions, and endeavored even to promulgate them in the church over which he ruled; but his conduct excited violent opposition among the clergy, and Lucaris was in consequence banished to Rhodes. Through the influence of the English ambassador, however, he was soon reinstated in his office. Unluckily, a confession of faith he had got printed, quite heretical—i.e., Protestant—in its character, fell into the hands of his adversaries, and he was once more involved in difficulties. In 1636 he was banished to the isle of Tenedos, and though recalled after a few months, in June, 1637, he was seized in Constantinople, hurried on board a vessel, and it was never properly ascertained what became of him. According to some, he was strangled in the ship which bore him off; according to others, he suffered this fate in a castle on the shores of the Black sea. His doctrines have been repeatedly condemned by Greek synods.

LUCARNE, a dormer window (q.v.). The name lucarne is generally applied to the small dormers in church spires.

LUCAS, a s. central co. of Iowa, traversed by the Chariton river and Whitebreast creek, and crossed by the Burlington and Missouri railroad; 432 sq.m.; pop. '80, 14,530. The surface is varied and the soil fertile, producing Indian corn, wheat, oats, and hay. This county contains a portion of the coal-measures of Iowa. Co. seat, Chariton.

LUCAS, a co. in n.w. Ohio, on lake Erie and the border of Michigan; drained by the Ottawa river, and having the Maumee river on the s.e.; traversed by the Lake Shore and other railroads, centering at Toledo; 300 sq.m.; pop. '80, 67,388. With a level country, there are extensive forests of sugar-maple, tulip-tree, elm, hickory, white-oak, beech, ash, etc. The soil is productive. There are important manufactures, and the leading productions are cotton, grain, and wool. Co. seat, Toledo.

LUCAS, FREDERICK, 1812–55; b. England. After graduating at the London university he was called to the bar. In 1839 he left the society of Friends, in whose tenets he had been brought up, joined the Roman Catholic church, and published his *Reasons for Becoming a Roman Catholic.* He established the *Tablet* newspaper, as an organ of Roman Catholic opinion; conducting it in London at first, but afterwards in Dublin. He was elected to parliament for the county Meath in 1852, and was regarded as the parliamentary leader of the Roman Catholic party. He had constantly urged, in his newspaper, in the *Dublin Review,* and in his political addresses, that it was the duty of the priests to participate in politics. Considerable opposition being manifested to such a course of action, he went to Rome to secure, if possible, the sanction of the pope for his opinions; but he was obliged to leave from ill-health, before a decision was reached.

LUCAS, PAUL, 1664–1737; b. at Rouen, France; son of a goldsmith; as a dealer in precious stones traveled in Greece, Asia Minor, Syria, and Egypt; entered the naval service of the Venetians, participated in the siege of Negropont in 1688, and became capt. of an armed vessel sent to cruise against the Turks. He returned to France in 1696, and sold a fine collection of curiosities to the royal cabinet. Again he visited Egypt and ascended the Nile; went to Tripoli by sea, and joined a caravan in its journey through Armenia and Persia. After being robbed at Bagdad, and taken prisoner by a Dutch privateer, he reached Paris in 1693, and in 1704 published his adventures under the title of *Voyage au Levant.* After this he made another journey to the East, where he collected inscriptions and made plans of buildings in Palestine, Syria, Cyprus, Egypt, and the Barbary states, Of this journey he gave an account in a volume published in 1714. The government sent him on new antiquarian expeditions in 1714 and 1723. In 1736 he went to Spain, where he was employed by Philip V. in arranging his cabinet of antiquities. D. at Madrid.

LUCAS, ROBERT, 1781–1853; b. at Shepherdstown, Va.; a descendant of William Penn. In 1800 he went to Ohio, and in the war of 1812–15 entered the service as capt., and was promoted to be first a lieut.col. of the U. S. army, and then a brig.gen. of Ohio militia. He presided over the convention which nominated Jackson for president in 1832; was governor of Ohio 1832–36, and governor of the territory of Iowa 1838–41. D. at Iowa City, Iowa.

LUCAS, SAMUEL, 1818-68; b. Bristol, Eng.; graduated at Queen's college, Oxford, in 1842, having won the Newdegate prize for a poem, and the chancellor's prize for an English essay. He was admitted to the bar of the Inner Temple in 1846. In 1853 he entered the profession of journalism as editor of the *Press*, and, a year later, became literary editor of the *Times*. Three volumes of his essays in that journal have been published, viz.: *Eminent Men and Popular Books, Biography and Criticism*, and *Mornings of the Recess*. From 1859 to 1865 he edited *Once a Week*, and then founded the *Shilling Magazine*. A volume, *Charters of the Old English Colonies*, edited by him, appeared in 1850; and twelve years later he collected a series of his essays from the quarterly reviews into a volume entitled *Secularia, or Surveys on the Main Stream of History*. In politics he was a conservative. D. at Eastbourne, Sussex.

LUC'CA, DUCHY OF, formerly a small independent state, now a province of central Italy, was bounded on the n. by Modena, on the e. and s. by Tuscany, and on the w. by the gulfs of Genoa and Massa. Area, 512 sq.m.; pop. '71, 280,070. The surface of the country is very diversified; the largest stream is the Serchio. Lucca is famed for the extreme fertility of its soil, and the superiority of its agriculture, which serves as a model to the whole Italian peninsula. The principal products are grapes, olives, grain, mulberries, chestnuts, and vegetables. The marshy flats on the coast afford excellent pastures for cattle. The manufactures are silks, oil (esteemed the best in Italy), glass, paper, linens, cottons, etc.; the principal export is oil. The Lucchesi are a frugal, shrewd race; numbers leave home in search of employment, and they form a large proportion of the itinerant figure-venders, organ-grinders, and stucco-workers of Europe.

Lucca (anciently called *Luca*) was made a Roman colony in 177 B.C. It was erected into a duchy by the Lombards, and recovered its liberty in 1055, when the chief town, Lucca, became a free city. In 1327 it was a duchy, and was ruled by the celebrated Castruccio Castracani. In 1370 it became an independent republic, was erected into a principality in 1805 by Napoleon for his sister Elisa Bacciochi, and passed to Maria Louisa of Spain in 1815. Her son, duke Carlo Luigi, ceded it to Tuscany in 1847, on obtaining possession of Parma and Piacenza; and in 1860 it was annexed to Sardinia. It now forms one of the Tuscan provinces in the new kingdom of Italy.

LUCCA, chief t. of the Italian province of Lucca, is situated in a fine plain, bounded by picturesque hills, and irrigated by the Serchio, 12 m. n.e. of Pisa. Pop. '72, 21,286. The commercial activity of its inhabitants obtained for it the name of "Lucca l'Industriosa." Its great trade is in olive-oil and silk, and it was the first place in Italy where the production and manufacture of silk were successfully introduced. The town is surrounded by ramparts, which form a delightful promenade, and command a fine view of the whole valley of the Serchio; the streets are mostly narrow and crooked, but well paved; the private dwellings are commodious, and the public edifices numerous and interesting. The cathedral contains several fine paintings. A splendid aqueduct, planned during the reign of the princess Elisa Bonaparte, and executed later, supplies the town with water, and is highly deserving of inspection. The environs of Lucca abound in delightful villas. In a charming valley, 15 m. from the town, are situated the famous mineral baths of Lucca, whose temperature varies from 96° to 136° F. The waters are exported to all parts of Italy.

LUCCA, PAULINE, b. Vienna, 1842; the daughter of Jews in humble life, she entered the chorus of a theater when only 14 years of age, but 3 years later had developed so much musical ability that she was cast for the part of "Elvira" in *Ernani*. She now attracted the attention of Meyerbeer, the composer, and through his influence succeeded in obtaining an engagement in Berlin, where she continued to be a favorite artist until 1872. During this period she sang also in London and St. Petersburg, and achieved a continental reputation. She married the baron von Rhaden, but was divorced from him. She visited the United States in 1872, making her first appearance at the academy of music, New York, Sept. 30, in that year. Here she became a popular favorite; her remarkable dramatic power, rich, full voice, and brilliant execution attracting favorable criticism in every quarter. Returning to Europe, she continued to sing in the principal cities, her professional career being marred only by her eccentricities of temper, which involved her in constant disputes and breaches of contract with her managers, on account of which she was frequently mulcted in heavy damages. As an actress, she has hardly been surpassed on the operatic stage, except perhaps in the single instance of Giulia Grisi. But both in her acting and her vocalization she has been largely subject to the influence of moods inseparable from her volatile temperament.

LUCE'NA, a t. of Spain, province of Cordova, and 40 m. s. of the city of that name, is picturesquely situated between two hills. Pop. 17,000. The neighboring territory is famous for its apricots and its breed of horses. Lucena is historically interesting, as the scene of the capture (April 21, 1483) of Boabdil, king of Granada.

LUCE'RA (ancient *Luceria*), a t. of southern Italy, in the province of Foggia, is situated on an eminence 10 m. w.n.w. of Foggia. It contains a college, a good museum, a cathedral, and a splendid episcopal palace. A large trade in cheese and cattle is carried on by the inhabitants. Pop. about 13,500. Numerous inscriptions and fragments of ancient sculpture have been found here.

LUCERNE, *Medicago sativa*, a species of medick (q.v.), one of the most valuable of the leguminous plants cultivated for the supply of green food to cattle. It is a native of the s. of Europe, and has been cultivated there from an unknown antiquity. It is partially naturalized in some parts of Britain. It is not very largely cultivated in Britain, although in some places very successfully, chiefly in the s. of England; but the climate of Scotland is not too cold for it, and the different results obtained by farmers who have tried it seem to depend chiefly on differences of soil and management. It is largely cultivated in some parts of North and South America, and in Peru with great success both on the coast, in all the heat of a tropical climate, and on the mountains to a height of more than 11,000 ft. above the sea; flourishing, however, only during the moister part of the year in the former situation. It endures great droughts, its roots penetrating very deep into the ground; but loves a rich and calcareous soil, and never succeeds on damp soils or tenacious clays. It is a perennial and affords good crops for a number of years. It is sown in rows, at 12 or 14 in. apart, and may be mown several times in a year, growing very quickly after being mown. The quantity of produce is very great, and no other forage plant is ready for use so early in spring. Lucerne has a rather erect stem, leaves with three obovate-oblong toothed leaflets; purplish-blue or sometimes yellow flowers in many-flowered racemes, and pods twisted two or three times round. It ought to be mown before it comes into flower, as it then becomes more fibrous, and less succulent and nutritious.

LU'CERNE, a canton in the center of Switzerland, with an area of about 577 sq.m., and a pop. in '70 of 132,338, showing a slight increase since '60. The soil is generally fruitful, and much grain and fruit are produced. In the more mountainous parts, the rearing of cattle is carried on to a greater extent than anywhere else in Switzerland. The highest elevation attained by the Alps in this canton is 6,900 feet. The principal stream is the Reuss, the principal lake that of Lucerne. The inhabitants are mostly of German race and language, and all belong to the Roman Catholic church, except about 4,000 Protestants, to whom the free exercise of their religion was first accorded in 1828. The constitution of Lucerne is a representative democracy; 100 deputies form the great council, whose president bears the title of *Schultheiss* (judge).

LUCERNE, capital of the canton of the same name, is situated on the Reuss, where it issues from the n.w. extremity of the lake of Lucerne. Near the lake, rising from the middle of the Reuss, is an old tower, which is said to have been once a light-house (*lucerna*), whence the name of the town. The arsenal is one of the most important in Switzerland, containing many old weapons used at the battle of Sempach. Lucerne has a theater, a public library, with a collection of natural history, manufactures of silks, cottons, flax, hemp, gloves, etc. Pop. '70, 14,524.

LUCERNE, LAKE OF, called also the *Lake of the Four Forest Cantons* (Uri, Unterwalden, Schwyz, and Lucerne), because its shores are formed by these, is one of the most beautiful sheets of fresh water in Switzerland or Europe. Length from Lucerne to Flüelen, about 22 m.; average breadth, about 1½ miles. The chief places on its banks are Lucerne, Küssnacht, and Alpnach at the n.w., and Flüelen near its s.w. extremity. It is navigated by several steamboats.

LUCERNE, ANNE CÉSAR, Chevalier de la. See LUZERNE.

LU'CIAN, a classic satirist and humorist of the first merit, was b. at Samosata, in Syria, in the earlier part of the 2d c., though the exact year is matter of conjecture. He himself tells us, in a piece called *The Dream*, that his parents were poor, and could not afford him a learned education. He was, in consequence, apprenticed to an uncle who was a statuary, in order that he might learn that trade; but he soon abandoned it, and betook himself to the study of letters. For a long time he led a somewhat vagrant and unsettled life, visiting the most of Greece, Italy, and Gaul, in the last of which countries he practiced with great success as a teacher of rhetoric. He is thought to have returned to his native country when about 40 years of age, after which time all his masterpieces were composed. The last thing we know about him is, that he was made a procurator of part of Egypt by the emperor Commodus. He died probably about the end of the 2d century. The statement of Suidas, that Lucian was torn to pieces by mad dogs on account of his impiety, finds no credence with modern scholars; neither does that of Volaterranus, that he was an apostate from Christianity. The dialogue entitled *Philopatris*, long attributed to Lucian, certainly shows an intimate knowledge of Christianity; but no critic now believes it to be a production of that writer. The fact is, Lucian was one of that class of men who do not readily embrace any form of religion—men whose sharp critical eyes see too many flaws to make it easy for them to acquire a pious or reverential spirit. In philosophy, as well as in religion, he called no man master. Philosophers are, indeed, the constant subjects of his humorous ridicule and pungent wit, aided by all the resources of a richly inventive fancy. His writings have been classified under seven heads: 1. The Rhetorical; 2. The Critical; 3. The Biographical; 4. Romances; 5. Dialogues; 6. Miscellaneous; 7. Poems. Of these, the most celebrated are his Dialogues, the principal of which are: *The Sale of Lives; Dialogues of the Gods; The Fisherman, or the Revivified; The Banquet, or the Lapithæ; Timon the Misanthrope; Dialogues of the Dead;* and *Icaro-Menippus, or Above the Clouds.* The

best of his romances, and a work of Rabelaisian humor, is his *True Histories*. The *editio princeps* of Lucian appeared at Florence in 1496; the best of the later editions is that commenced by Hemsterhuis in 1730, and finished by Reitz (Amst., 1743). Lucian has always been a great favorite with scholars, and has been translated into most of the European languages. The best English version (incomplete, however) is that of Dr. Franklin (2 vols., Lond., 1780, and 4 vols., Lond., 1781).

LUCIAN, SAINT, a presbyter of Antioch, said to have been b. at Samosata. Left an orphan at the age of 12, he removed to Edessa, where he was baptized, and became a pupil of the eminent biblical scholar, Macarius. Entering the ministry at Antioch, he founded and conducted a theological school. He became greatly celebrated as an ecclesiastic and biblical scholar. In the reign of Diocletian, by order of Maximin, he was arrested in Antioch, transported to Nicomedia, tortured, and put to death in prison. He was buried at Helenopolis, in Bithynia. Ecclesiastical writers mention him as a man of great learning and piety. Eusebius calls him "a person of unblemished character;" and Chrysostom, on the anniversary of his martyrdom, pronounced a panegyric which is still extant. Jerome says that "Lucian was so laborious in the study of the sacred writings that, in his own time, some copies of the Scriptures were known by the name of Lucian;" and that his "revision of the Septuagint version of the Old Testament was generally used by the churches from Constantinople to Antioch." Jerome speaks of him as also the author of several epistles and theological tracts. In the ecclesiastical history of Socrates is an extant confession of faith drawn up by Lucian. There has been dispute respecting his views of the Trinity, some charging him with Arianism, and even maintaining that he was the founder of Arianism, Arius acknowledging himself as his disciple. Certain it is that he was excluded from the church for heresy by three successive bishops of Antioch. But he was afterwards restored, and was greatly honored for his learning and piety. After his death he was enrolled in the calendar of the church as a saint and martyr.

LUCIANISTS, a religious sect, deriving their name either from Lucian, a presbyter of Antioch, whose theological views were Arian, or from Lucian, a follower of Marcion, the author of numerous forgeries and whose theological views were heretical. He is termed by Epiphanias, Lucian *the elder*. It is conjectured that those who first took the name of Lucianists were disciples of Lucian the Marcionite, and that afterwards it was applied to those who adopted the tenets of Lucian the presbyter of Antioch.

LUCID INTERVAL. What intermission is to certain fevers, a lucid interval is to certain forms of mental disease. Those forms in which it occurs are characterized by exaltation or perversion, and not by impairment of the faculties or feelings. There may thus be a cessation or suspension of the fury in mania; there cannot be repair or enlightenment of the obscurity in idiocy or senile dementia. It may consist in the mere substitution of clearness and calmness for violence and confusion; in the occasional recognition of his actual condition and external relations by the lunatic; or in the re-establishment of intelligence and natural feeling so perfect and complete as to differ from sanity solely in the want of permanence. The duration is likewise sometimes so considerable and regular as to divide the mental and moral life of the individual into two halves. It has been believed that even in such cases the interval is a part or link of the disease, and that there invariably exists an under-current of unsoundness. It is found to be extremely difficult to distinguish this state from real and trustworthy restoration to reason, except by reference to duration. Practically and legally, these conditions have been held to be identical. A will executed during a lucid interval, although that was extremely transitory, and although the testatrix unloosed the straps by which her hands had been confined, in order to execute the document, has been held to be valid; all that appears to be required, under such circumstances, is to prove that the conduct of the individual bore the aspect of rationality and health. It has been observed that, immediately before death, a small proportion of the insane regain lucidity, and, after years of extravagance and absurdity, die in possession of comparative sense and serenity. This change is supposed to depend upon the failing powers of the circulation.—Burrows, *On Insanity;* Shelford, *On Law of Lunatics*, p. 289.

LUCIFER, or PHOSPHORUS, the name applied by the classics to the planet Venus when it is a morning star; also employed to designate the king of Babylon in a passage of Isaiah (xiv. 12), which has been misconstrued into a reference to Satan. Following is the passage in question: "How art thou fallen from heaven, O Lucifer, son of the morning! How art thou cut down to the ground, which didst weaken the nations!" Of the mistaken rendering of this passage, Kitto says: "Tertullian and Gregory the great understood this passage of Isaiah in reference to the fall of Satan; in consequence of which the name Lucifer has since been applied to Satan."

> How wretched
> Is that poor man that hangs on princes' favors.
>
> When he falls, he falls like Lucifer,
> Never to rise again.—*Shakespeare, Henry VIII.*

In the Roman mythology Lucifer was the son of Astræus and Aurora, and was charged with the care of the chariot and horses of the sun, fulfilling this duty in company with the

Hours. Milton, with Shakespeare and other writers, adopts the error of the fathers in his *Paradise Lost*, giving to the fallen archangel the name Lucifer. The fact that the Latin and Greek roots of the words lucifer and phosphorus translate into the same meaning of "light bringer," has caused the application of the term lucifer matches, these articles being tipped with phosphorus.

LUCIFER, b. Sardinia; d. about 370; bishop of Cagliari, in Sardinia, and known first in history as a zealous opponent of Arianism. In 354 he was sent by Liberius, bishop of Rome, with Eusebius of Vercelli to defend Athanasias at the council of Milan, for which he was for a time imprisoned, and then banished by the Arian emperor Constantius. At Eleutheropolis, in Syria, he composed his chief work, *Ad Constantium Augustum pro Sancto Athanasio*. In consequence of his bold and vehement invective he was sent to Egypt. Released from exile on the death of Constantius, he was commissioned by the council of Alexandria to heal the divisions in the church of Antioch, which arose from the supposed Arianism of Meletius, its bishop. But he widened the schism by ordaining Paulinus to the see, for which he was rebuked by his friends. Chafing under the rebuke and displeased with the decree of the council of Alexandria readmitting the adherents of Arianism, he retired in 363 to his native island of Sardinia and founded a sect called Luciferians, whose distinguishing tenet was that no Arian should be received into the church. He died about 370. Besides the work mentioned, he published *Epistola ad Eusebium; De non Conveniendo cum Hæreticis; De Regibus Apostolicis; De non Parcendo in Deum Delinquentibus; Moriendum pro Filio Dei; Epistola ad Florentium Magistrum Officiorum; Epistola ad Catholicos*. These works, distinguished by an acrimonious spirit, are valuable chiefly for the scriptural quotations which they contain.

LUCIFER MATCHES. See MATCHES.

LUCILIUS, CAIUS, B.C. 148–103; b. Suessa Aurunca (Sessa), n.w. part of Campania, Italy. He was of the equestrian order, and the maternal grand-uncle of Pompey the great. In his 16th year he served under Scipio Africanus at the siege of Numantia. He is generally considered the inventor of satirical composition, at least of that form adopted by Horace, Perseus, and Juvenal. His satires were popular in the Augustan age, and to him Horace, Juvenal, and Perseus seem to have been indebted for their best thoughts and expressions. His style was distinguished by great energy of expression, but deficient in elegance and clearness. He attacked vice with great severity. He was on intimate terms with Lælius and Scipio. His works consist of 30 satires, a comedy, epodes, and hymns, none of which are extant except 800 fragments of his satires, the longest of which has only 13 verses. These have been collected and published by R. and H. Stephens in their *Fragmenta Poetarum Veterum Latinorum*. He wrote also the *Life of Scipio the Elder*.

LUCINA, in Roman mythology, the surname of Juno as the goddess of light, and especially as the deity who presided over the birth of children—the bringing them to light: from *lux, lucis*, "light." This is also the name of a goddess in Egyptian mythology, supposed to have exercised special charge over upper Egypt.

LUCI'NA, a genus, and LUCINIDÆ, a family of lamellibranchiate mollusks, allied to *veneridæ* (see VENUS). The shell is orbicular, or nearly so, and bears a very long impression of the anterior muscle. The animal has a long, generally cylindrical foot. The species are numerous, are found in almost all seas, and at all depths in which life is known to exist, burrowing in the sand or mud. There are also many fossil species in the more recent formations.

LÜCKÉ, GOTTFRIED CHRISTIAN FRIEDRICH, D.D., 1792–1855, b. Egeln, in the duchy of Magdeburg; studied theology two years at Halle under Knapp and Gesenius, and at Göttingen under Planck. Here he became known from his prize essay, *De Ecclesia Apostolica*. This work procured for him an important office in the theological faculty, and brought him into close literary intercourse with Bunsen, Ernest Schulze, Brandis, Lachmann, and other scholars. In 1817 he published his *Grundriss der Neutestamentlichen Hermeneutik*. In 1818 he was made extraordinary professor of theology at Bonn, and devoted himself with enthusiasm to the study of exegesis and church history. He contributed to the *Theologische Zeitschrift* and *Christliche Zeitschrift*, and began his *Commentary on the Writings of John*. He wrote biographical notices of Planck, Schleiermacher, De Wette, and many others, and during the conflict with Strauss he wrote a tract entitled *Strauss und die Züricher Kirche*. In 1827 he became professor of theology at Göttingen. He excelled greatly as a commentator, and did much to check the influence of rationalistic criticism.

LUCKENWAL'DE, a t. of Prussia, government of Potsdam, and capital of a circle of the same name, is situated on the river Nuthe, 30 m. s.s.w. of Berlin. Pop. '75, 13,816. One of its suburbs, called Little Gera, is inhabited by Russian colonists. Its cloth manufactories are among the largest in Prussia. Luckenwalde is a station on the Berlin and Anhalt railway.

LUCKNER, NICOLAUS, 1722–94, b. Bavaria; entered the Prussian service, and distinguished himself in the seven years' war. He joined the French army, with the rank of lieut.gen., in 1763. In 1791 he was made a marshal, and in 1792 took command of the

troops in the n. of France, and captured Courtrai which he soon abandoned, and withdrew to Lille. Taking command of another force he defeated the Austrians near Valenciennes; but soon after was replaced by Kellermann, and was reprimanded by the convention. In 1793 his pension was taken away from him, and in January of the next year he was guillotined.

LUCKNOW', the capital of Oude, in British India, stands on the right or s.w. bank of the Gumti, by which it has a navigable communication upwards for many miles, and downwards all the way to the Ganges. It is in lat. 26° 52′ n., and long. 81° e., is 360 ft. above the sea, and is 610 m. from Calcutta. The place is connected with the opposite side of the river by three bridges, one of stone, another of boats, and a third of iron. Though Lucknow does not appear to contain any very ancient buildings, it is yet understood to be older than any one of the other great cities of India, claiming to have been founded by Lakshmana, brother of Rama. The middle portion, which may be said to represent the original town, contains, with the exception of a few brick-houses, little but mud walls and straw roofs. On either side of these central hovels are the handsomer sections of Lucknow, generally dating, however, no further back than 1775. The population in 1871–72 was 284,779. As an illustration at once of manners and of government, all classes, down to the annexation of Oude in 1856, were wont to go fully armed, the very shop-keepers being equipped with swords and shields. In connection with the mutiny of 1857, Lucknow stood foremost in point of interest, surpassing every spot in the energy and obstinacy of its defense against the insurgents, and almost equaling Delhi itself in the grandeur and brilliancy of the operations, which recovered it, after a temporary abandonment, from the rebels.

LUÇON, a t. in France, in the department of La Vendée, arrondisement of Fontenai; pop. 6,603. It is a gloomy town, situated on the eastern edge of the Fens, and at the extremity of the Luçon canal, which connects it with the bay of Aiguillon, and is navigable for vessels of 60 tons. It contains a diocesan seminary, and gives title to a bishop. It has manufactories of porcelain.

LUÇON, or LUZON. See PHILIPPINE ISLANDS, *ante*.

LUCRE'TIA, a Roman matron, daughter of Lucretius and wife of Collatinus, celebrated for her virtue and beauty. Having been outraged by Sextus, son of Tarquinius Superbus, king of Rome, she made her father and husband swear to avenge her wrong, and then stabbed herself, B.C. 509. The bloody poniard and her dead body, being exposed to the senate were the signal of a revolution, which led to the expulsion of the Tarquins from Rome and the establishment of the republic.

LUCRE'TIUS, TITUS CARUS. Of the life of Lucretius we know almost nothing with certainty, as he is mentioned merely in a cursory manner in contemporary literature. Hieronymus (340–420 A.D.), in his translation of the chronicle of Eusebius (264–340 A.D.), gives the date of his birth as 95 B.C. (according to others, 99); but he does not specify the source from which his statement is derived. It is alleged, further, that he died by his own hand, in the 44th year of his age, having been driven frantic by a love-potion which had been administered to him; that he composed his works in the intervals of his madness; and that these works were revised by Cicero. Donatus (Life of Virgil), on the contrary, affirms that his death occurred in 55 B.C., on the very day on which Virgil assumed the *toga virilis*. The stories of the philter, the madness, the suicide, and the revision of the works by Cicero, rest on very insufficient authority, and must be received with extreme caution. The peculiar opinions advanced by Lucretius would render him specially obnoxious to the early Christians, and it is possible that the latter may have been too easily led to attribute to him a faith which, in its mysterious nature and melancholy termination, was deemed but a due reward for the bold and impious character of his teachings. The great work on which the fame of Lucretius rests is that entitled *De Rerum Natura*, a philosophical didactic poem in six books. It is dedicated to C. Memmius Gemellus, and was published about 56 B.C. Lucretius was a reverent follower of the doctrines of Epicurus (q.v.), and his poem is in large measure an exposition of the physical, moral, and religious tenets of that philosopher. The great aim of the poet was to free his fellow-countrymen from the trammels of superstition, and to raise them above the passions and the weaknesses of our natural condition. With his master, Epicurus, Lucretius adopted the atomic theory of Leucippus, which taught that certain elementary particles, existing from all eternity, and governed by fixed laws, combined to form the universe of matter; that the existence and active interference of a supreme overruling deity was not necessary to be supposed in order to account for the marvelous and abnormal in nature; and that whatever *appeared* to be miraculous was, in reality, not so, but was merely the result of certain fixed laws, which operated with unerring precision, and in a natural process. Regarded merely as a literary composition, the work of Lucretius stands unrivaled among didactic poems. The clearness and fullness with which the most minute facts of physical science, and the most subtle philosophical speculations, are unfolded and explained; the life and interest which are thrown into discussions in themselves repulsive to the bulk of mankind; the beauty, richness, and variety of the episodes which are interwoven with the subject-matter of the poem, combined with the majestic verse in which the whole is clothed, render the

De Rerum Natura, as a work of art, one of the most perfect which antiquity has bequeathed to us. For a fuller estimate of Lucretius and his poetry, see prof. Sellars's essay in *The Roman Poets of the Republic* (Edin., 1863). The *editio princeps* of Lucretius was published at Brescia about 1473; only three copies are known to exist. The best editions of Lucretius are by Wakefield (Lond., 1796, 3 vols. 4to, and Glas., 1813, 4 vols. 8vo); by Forbiger (Leip., 1828, 12mo); by Lachmann (Berlin, 1850, 2 vols.); and by prof. Munro (3d edition, 1870). The *De Rerum Natura* has been translated into English verse by Thomas Creech (Lond., 1714, 2 vols. 8vo); and by John Mason Good (Lond., 1805–7, 2 vols. 4to); into English prose by the rev. J. S. Watson, M.A. (Lond., Bohn's classical library, 1851, post 8vo); and by prof. Munro, at the end of his edition.

LUCUL'LUS, L. LICINIUS, a very distinguished Roman general, b., it is conjectured, about 110 B.C. In the first Mithridatic war, he commanded the fleet as legate of Sulla. In 77 B.C. he filled the office of prætor, and immediately after held the administration of the province of Africa. In 74 B.C. he was chosen consul along with Marcus Aurelius Cotta, and got Cilicia for his province, whilst Cotta had Bithynia. Both consuls arrived in Asia about the close of 74 B.C. Cotta was soon after utterly defeated by Mithridates, who had burst into Bithynia at the head of 150,000 troops, forced to take refuge in Chalcedon, and there was besieged by the victor. Lucullus, however, advanced to his relief at the head of 35,000 men, compelled Mithridates to raise the siege, and almost annihilated his army on its retreat. In 71 B.C. Pontus became subject to the Romans. The measures which Lucullus now introduced in the government of the province of Asia, to secure the provincials against the fearful oppressions and extortions of farmers of the taxes and usurers, especially his fixing a uniform and moderate rate of interest for all arrears, show that he was a just, wise, and humane administrator; but though the cities of Asia were grateful for his clemency, the equestrian order in Rome (who had the farming of the taxes) became implacably hostile to him, and his own troops grew disaffected on account of the strictness of his discipline. For some time, however, things seemed to go on well enough. In the spring of 69 B.C. he marched into Armenia with a small force of 12,000 foot and 3,000 horse, and gained a complete victory over Tigranes, at the head of an army of 220,000 men. In the following year he gained another great victory at the river Arsanias over a new army led against him by Tigranes and Mithridates; but the mutinous spirit of the legions—in spite of these splendid triumphs—daily increased. Lucullus now wanted to besiege Artaxata, the capital of Armenia, but the soldiers refused to advance further. After this he could do nothing; not a soldier would serve under him. At last, he was superseded by Pompey, and left Asia 66 B.C. The cabals of his enemies so much prevailed against him that he was three years in Rome before he obtained his triumph. In conjunction with the aristocratical party, he attempted to check the increasing power of Pompey, and the attempt caused the coalition known as the first triumvirate. But he was ill fitted to act as leader against such unscrupulous men, and soon withdrew altogether from political affairs. During his public career he had acquired (but not unfairly) prodigious wealth; and he spent the remainder of his life surrounded by artists, poets, and philosophers, and exhibiting in his villas at Tusculum and Neapolis, and in his house and gardens at Rome, a luxury and splendor which became proverbial. A single supper—on particularly grand occasions—would cost him 50,000 denarii (£1770). Towards the close of his life, his faculties began to decay, and his property was placed under the management of his brother. He died about 57 B.C. Lucullus was a man of great military talent, humanity, liberality, and love of justice; his great fault was his love of pleasure; not exactly vicious pleasure, for he was an epicure rather than a profligate; yet so purely sensual that it seems to have made people—certainly his soldiers—believe him to be grossly selfish and unsympathetic.

LUDEN, HEINRICH, 1780–1847; b. Germany; educated at Göttingen, and from 1806 till his death professor of history at Jena. He wrote a *History of Antiquity; History of the Middle Ages;* and *History of the German People*, the latter covering the period down to 1237.

LU'DENSCHEID, a t. of Prussian Westphalia, 33 m. n.e. from Cologne, in a mountainous district, not far from the right bank of the Volme, a branch of the Rhine. It has cotton-mills, and manufactures of cutlery, buttons, files, and other articles of hardware. There are calamine mines in the neighborhood. It has of late increased rapidly in population and prosperity. Pop. '75, 8,567.

LÜDERS, ALEXANDER NIKOLAYEVITCH, Count, 1790–1874; b. Russia; of German descent. Entered the Russian army in 1807, and served through the war with France. He participated in the Polish campaign, was present at the capture of Warsaw, and commanded a force in the Caucasus from 1843 to 1845. He invaded Transylvania in 1849, and in the Crimean war held a command which he was forced to resign on account of ill-health. He assumed command over Poland in 1861, and for his services in restoring order in Warsaw was created count. The same year an unsuccessful attempt was made to assassinate him.

LUD'INGTON, a city in w. Michigan, organized 1867; a terminus of the Flint and Père Marquette railway, connected with Milwaukee by two lines of steamers; pop. '74,

2,500. It is situated on lake Michigan at the mouth of the Marquette river, which a few miles above enters a narrow gulf, of its own name, flowing through it to the lake. It has several manufactories of lumber and shingles, carriage factories, and machine shops; tan-bark is one of its commodities. Its inhabitants depend largely on the fisheries and an inland farming district. It is 137 m. w. of East Saginaw, 54 m. n.w. of Muskegon, 84 m. from Milwaukee, and 125 m. w. of Lansing. It has 2 banks, 4 churches, a convenient harbor, 2 newspapers, 8 hotels, and a fine public school-house.

LUDLOW, a municipal and parliamentary borough of England, in the county of Salop, at the confluence of the Corve and Teme, 25 m. s.s.e. of Shrewsbury. It is an old and very interesting town; its parish church dates from the reign of Edward III.; its free school, founded by Edward IV., has an annual income of £350. The castle, now a magnificent ruin, was at one time one of the most important strongholds against the Welsh. Here Arthur, eldest son of Henry VII., celebrated his marriage with Catharine of Aragon, afterwards the wife of Henry VIII.; and here, in 1634, Milton's mask of *Comus* was performed for the first time. Ludlow returns one member to parliament. Pop. '71 of parliamentary borough, 6,203; of municipal borough, 5,087. It has been represented in parliament since the reign of Edward IV.

LUDLOW, EDMUND, 1620–93; b. Maiden-Bradley, Wiltshire, Eng.; was educated at Oxford; joined the parliamentary army under Essex as a volunteer, and was at the battle of Edgehill in 1642. After the death of his father he entered parliament for Wiltshire, and obtained command of a regiment of cavalry. He was an ardent republican, denounced the misgovernment of the king, advocated the establishment of a commonwealth, and supported the bill for the abolition of the house of peers. He was one of the judges of Charles I. His independence rendered him obnoxious to Cromwell, who sent him after the death of Charles to Ireland in 1650 with a military command. When Cromwell assumed the authority of protector, Ludlow vigorously protested against it, being in favor of a republic. Returning to England he refused unqualified submission to Cromwell. Distrusted on account of this refusal, security was required that he would not oppose the government, which being privately furnished by his brother Thomas, Ludlow retired into Essex, where he resided till Cromwell died. He then returned, was active in parliament, and endeavored to restore the commonwealth. On the restoration of Charles II., feeling himself insecure, he fled the country in 1660, landed at Dieppe, and then went to Switzerland, taking up his residence at Vevay. Wearied with exile, he returned in 1689, when, being threatened with arrest for participating in the murder of Charles I., he again fled to Vevay, where he died. Over the doorway of his house he had placed the inscription, *Omne solum forti patria.* Here he wrote his *Memoirs* in 3 volumes.

LUDLOW, FITZHUGH, 1837–70; b. Poughkeepsie, N. Y.; entered upon the life of an author when only 18 years old, and two years later published *The Hasheesh Eater*, which achieved immediate popularity. He next became known as a sketch and story writer, contributing freely to *Harper's Monthly* and other leading magazines; and, having made a western tour, gave an account of his experiences and of the states and territories visited in a work entitled *The Heart of the Continent.* He also wrote *The Opium Habit*, a book describing the insidious inroads of the drug on the constitution and *morale* of those habituated to its use, and designed to be a warning against acquiring the habit. Ludlow was unfortunately himself a victim to the "opium habit," a fact which seriously invaded his literary capacity, naturally of excellent quality. He had an exuberant fancy, a brilliant flow of language, and graphic descriptive powers. The last few months of his life were spent in Switzerland, where he died, every effort being made by loving attention to redeem his shattered constitution.

LUDLOW, ROGER, b. England, and settled at Dorchester, Mass., in 1630. After serving for 4 years as one of the assistants, being disappointed in his ambition to be governor, he settled with other Massachusetts emigrants at Windsor, Conn., in 1635, and for the next 19 years was chosen either deputy-governor or a magistrate. In the meantime he had taken up his residence at Fairfield, by whose inhabitants he was appointed, in 1654, to conduct a proposed Indian campaign; but this failing to receive the sanction of the general court, Ludlow left Connecticut for Virginia. The time of his birth and death are unknown. During his residence in Connecticut he compiled for the colony its first law code, which was published in 1672.

LUDLOW FORMATION, the uppermost division of the silurian strata (q.v), consists of an extensive series of indurated argillaceous beds, with bands of dark-gray argillaceous limestone. The town of Ludlow stands upon the higher strata of this formation.

LUDOLPHUS, or LUDOLF, JOB, 1624–1704; b. Erfurt, Thuringia; educated at Leyden, studying specially law and the oriental languages. After leaving Leyden he was successively tutor to the sons of the Swedish ambassador at Paris, and to the children of the duke of Saxe-Gotha at the court of the duke. He spent the latter part of his life at Frankfort-on-the-Main, where he was made president of the academy of history. He was one of the most eminent oriental scholars of his age. In 1649 he visited Rome and mastered the Ethiopic language by the aid of an Abyssinian whom he met. In 1661 he published a dictionary and grammar of this language. He learned also the

Amharic language, of which he published a dictionary and grammar. His other most important works are: *Historia Æthiopica; Ad suam Historiam Æthiopicam Commentarius; Relatio Nova de hodierno Habessiniæ statu ex India nuper allata; Appendix contineus Dissertationem de Locustis.*

LUDWIG I., KARL AUGUST, King of Bavaria, the eldest son of king Maximilian Joseph, b. Aug. 25, 1786. In 1810 he married the princess Theresa of Saxe-Hildburghausen. As crown-prince, he took little part in politics, but devoted himself to science and the fine arts, and lived very economically, in order that he might be able to spend large sums in forming a magnificent collection of masterpieces of sculpture, known as the glyptothek. He succeeded to the throne on Oct. 13, 1825, and commenced his reign by granting some reforms. His reign was distinguished by the encouragement of the fine arts, and the erection of magnificent public buildings; he also inaugurated the first railway that Germany possessed—that from Nuremberg to Furth—and executed the fine canal called *Ludwigskanal*, which unites the Danube and the Main. But it was no less characterized by the prevalence of ultramontane influence, intolerance toward all who did not belong to the church of Rome, and contempt of constitutional rights and forms, whilst the king's conduct gave great occasion of scandal, particularly in his connection with the dancer Lola Montez (created countess of Landsfeld). On account of the revolutionary disturbances in Feb. and Mar., 1848, Ludwig resigned the crown in favor of his eldest son, Maximilian. He died in 1868.

LUDWIG II., King of Bavaria, b. Aug. 25, 1845; succeeded his father, Maximilian II., Mar. 10, 1864. He is a bachelor and quite eccentric in his habits as a monarch, showing himself infrequently to his subjects, and being devoted as much to art, especially music, as to the cares of government. He took the side of Prussia in the late war with France, and favored the unity of Germany under the imperial rule of William I. His intimacy with Richard Wagner, the musical composer, in the first years of his reign, excited the opposition of the people to such an extent that the king was obliged to send him away from the court. He follows his own caprices rather than the guidance of any political party. He loves the solitude of his magnificent palaces, where he devotes much time to music and theatricals.

LUDWIG, KARL FRIEDRICH WILHELM, b. Germany, 1816; educated at Erlangen and Marburg, and made professor of comparative anatomy at the latter in 1849. He held the chair of physiology at Zürich, 1849–55; at Vienna, 1855–65; and in the latter year was called to the same position in Leipsic. He had made a specialty of anatomical physiology, and has published, besides his contributions to scientific journals, *Lehrbuch der Physiologie des Menschen*, and *Arbeiten aus der Physiologischen Anstalt zu Leipzig.*

LUDWIG, OTTO, 1813–65; b. Germany. Obliged by ill-health to give up music, which he had studied under Mendelssohn, he turned his attention to literature, and produced a number of tragedies and stories: *Der Erbförster* (1853), *Die Makkabaer* (1855), *Zwischen Himmel und Erde* (1856). *Reden oder Schweigen* and *Shakespeare Studien* were published after his death.

LUD'WIGSBURG, a t. of Würtemberg, about 8 m. n. of Stuttgart. It was founded in 1706 by duke Eberhard Ludwig, in consequence of a quarrel with the Stuttgarters, and is the second royal residence. Ludwigsburg was laid out with painful regularity, and has an artificial and lifeless look. It is the principal depôt for soldiers in Würtemberg, not less than 4,000 being stationed here, whence it has got the name of the Swabian Potsdam, and has an arsenal, a cannon-foundry, a military academy, and a royal castle, with splendid picture-gallery and gardens. Pop. '75, including military, 14,709.

LUD'WIGSHAFEN, a t. in Rhenish Bavaria, opposite Mannheim, on the Rhine; pop. 12,093. It is a fortified town, and was founded by Louis I. of Bavaria in 1843. The river is crossed at this point by an iron bridge, and there is considerable commerce.

LUFF, in nautical parlance, is to bring a ship's head to the wind, preparatory to tacking, or otherwise. The *luff* of a vessel is the roundest part of her bow.

LUGARD, Sir EDWARD, b. 1810; educated at the military college in Sandhurst (England); entered the British army as an ensign in 1828, and served many years with distinction in India. He was in the Afghan war of 1842, in the campaign on the Sutlej, in that of the Punjab, and in the Persian expedition of 1857, being promoted successively to be assistant adjt.gen., adjt.gen., chief of staff, maj.gen., lieut.gen., and gen. He was made permanent under-secretary of war in 1861, and president of the army purchase commission and member of the privy council in 1871; K.C.B. in 1857, and G.C.B. in 1867.

LUGA'NO, a t. in the canton of Ticino, Switzerland, stands on the n.w. shore of the lake of the same name. It is entirely Italian in character, with dingy and dirty arcaded streets; but its environs display all the richness of Italian scenery. Lugano contains several factories for throwing silk, and is the seat of a flourishing transit trade between Switzerland and Italy. From *Monte Salvadore*, in the vicinity, a magnificent view may be obtained. Pop. '70, 6,024.

LUGANO, LAKE OF, is situated on the s. of the canton of Ticino, Switzerland, three of its arms reaching into the Italian territory. Its greatest length is about 20 m.; but

from its exceedingly irregular shape, it is nowhere more than 1¼ m. broad. The character of its scenery, though perhaps as beautiful, is more rugged than that of lakes Como and Maggiore.

LUGANSK', a market t. in the government of Ekaterinoslav, European Russia, situated on the Lugan, a branch of the Donetz, 100 m. n.n.w. of Taganrog, is the seat of the only iron-works in the s. of Russia. The ore was formerly brought from the Ural mountains, but is now found in sufficient quantity in the neighborhood. Lugano has also a cannon-foundry and coal-mines, and, during the Crimean war, supplied the Russian fleet with coal and ammunition. Pop. '67, 10,290.

LUGDUNUM. See LYONS, *ante.*

LUGGAGE of travelers, though, in a certain sense, attached to the person, and under one's immediate care, and not paid for separately, is nevertheless protected by the contract; and carriers of all kinds are bound to carry luggage safely, and if it is lost, must pay damages for it. Owing to the established rule, that luggage is not paid for separately, it has often been attempted by travelers to abuse this privilege, and carry merchandise as part of and mixed up with their luggage, in order to escape any separate and extra payment. Most railway companies, accordingly, by their by-laws fix a limit as to weight for this luggage, and it is presumed that luggage consists only of wearing-apparel or things for personal use, and not articles of trade intended for sale. Though carriers or railway companies cannot get rid of liability for this luggage by giving any notice or making a by-law to that effect, yet it is competent for all carriers to specify certain articles of merchandise, which, whether they are mixed up with luggage or not, must be separately paid for, otherwise they will not be responsible. Such are gold or silver in a manufactured state, jewelry, watches, clocks, trinkets, stamps, maps, writings, title-deeds, paintings, pictures, glass, china, silk, furs, and lace, provided these exceed in value £10. Unless notice of such articles being included in the luggage is given to the carriers or company, and an increased rate paid, they will not be responsible for the loss. Except, therefore, these excepted articles, the carrier is bound to receive, carry securely, and deliver the luggage of travelers, notwithstanding the traveler has it in his personal charge. Thus, a railway porter, on the arrival of the train, having carried a traveler's luggage to a cab and lost it in the way, the railway company was held responsible. A carrier has a lien on the luggage for the fare, if not paid, and can keep it till such fare is paid; but as prepayment is now the universal practice, this remedy is seldom resorted to.

LUGGER, a small vessel carrying two or three masts, with a lugsail (see below) on each, and occasionally a topsail. The rigging is light and simple, and the form of the sails enables a lugger to beat close up to the wind. Among English boats, the lug-rig rarely extends beyond the larger class of fishing-vessels, though there are some very elegant lugger yachts in the different clubs. In the French service, however, it is a favorite rig, and is used for vessels of sizes as large as British schooners.

LUGSAIL, a quadrilateral sail used in luggers and open boats. It is bent, by the upper side, upon a straight yard, which is slung on the mast in an oblique position, one-third to windward, two-thirds on the leeward side of the mast.

LUGO, a province of Spain, in Galicia, on the Atlantic coast, between long. 6° 52′ and 8° 4′ w.; 3,484 sq.m.; pop. 474,286. In the n. part it has a mountainous surface, with mines of lead and iron; the southern part is level and fertile, and produces fruits, wine, and wheat.

LU'GO (the *Lucus Augusti* of the Romans), a t. in the n.w. of Spain, capital of the province of the same name, is situated on the left bank of the Miño, 50 m. e.n.e. of Santiago. It is the seat of a bishop, has a cathedral of the 12th c., and several other churches, and manufactures of silk and leather. It was celebrated in the time of the Romans for its warm sulphur-baths. Pop. 9,000.

LU'GO, a t. of central Italy, in the province of Ravenna, 32 m. s.e. from Ferrara. It is supposed to be the site of the ancient *Lucus Dianæ.* Lugo is an important provincial town. There is an annual fair which lasts from the 1st to the 19th of Sept., and is the occasion of a great concourse. Lugo has a very considerable trade in hemp, flax, rice, wine, brandy, etc. Pop. about 8,500.

LU'GOS, a market t. of the Austrian empire, in the Banat, on the Temes, a branch of the Danube, 32 m. e.s.e. from Temeswar. It consists, strictly speaking, of two contiguous towns, the inhabitants of the one, DEUTSCH-LUGOS, being mostly of German race, and those of the other, ROUMANISCH-LUGOS, or WALLACHISCH-LUGOS, being Roumanian. Pop. of former, '69, 3,350; of latter, 8,304.

LUG-WORM, or LOB-WORM (*arenicola piscatorum*), one of the *dorsibranchiate annelidæ,* extremely abundant on the British shores, and very valuable as bait to fishermen. It inhabits the sand, on the surface of which, after the tide has retired, innumerable coils are always to be seen, the *casts* of this worm. It is larger than the earth-worm, sometimes a foot long, is destitute of eyes, has no distinct head, but is much thicker at the extremity where the mouth is situated than at the other. The mouth has no jaws, nor teeth, nor tentacles. There are two rows of bristles along the sides, organs of locomo-

tion, by means of which the lug-worm works its way through the sand. About the middle, it has on each side six tufts of gills. When touched, it exudes a yellowish fluid; and an exudation from its body slightly agglutinates the particles of sand, so as to form a tube through which it passes and repasses. It is one of the annelids most remarkable for the red color of the blood, which imparts a fine crimson to the gill-tufts.

LUIGI, ANDREA DI, 1470–1512; b. Italy; known also as L'Ingegno, and Andrea d'Assisi. He was a pupil of Perugino, with whom he worked on the Cambio at Perugia. Little is known of his work, but a coat-of-arms in the Assisi town-hall is ascribed to him.

LUINI, or **LOVINO DA LUINI**, BERNARDINO, b. about 1460 at Luini, near the Lago Maggiore, a celebrated painter of the Lombard school. He is generally stated to have been the principal pupil of Leonardo da Vinci, but it rather appears that he was educated under Stefano Scotto; and though, from having attended the academy of the fine arts founded at Milan by Ludovico il Moro, of which Leonardo was director, he may be styled a pupil of that great artist, yet it is not proved that he received any direct instruction from him. Though Luini occasionally imitated the style and execution so closely as to deceive experienced judges, his general manner had a delicacy and grace sufficiently original and distinct from that of Leonardo. Still, the works of the former are often attributed to the latter, in order to increase their value. He executed numerous works at Milan in oil and fresco. His frescos at Lugano, Saronno, and Pavia are justly admired. The date of his death is not exactly known, but he was alive in 1530.—He had a brother, AMBROGIO, who imitated his style, and several sons who also were painters.

LUISE, AUGUSTE WILHELMINE AMALIE, queen of Prussia, was b. Mar. 10, 1776, at Hanover, where her father, the duke Karl of Mecklenburg-Strelitz, was then commandant. She was married to the crown-prince of Prussia, afterwards Frederick William III., on Dec. 24, 1793. After his accession to the throne, she became exceedingly popular, her great beauty being united with dignity and grace of manners, and with much gentleness of character and active benevolence. This popularity increased in consequence of her conduct during the period of national calamity which followed the battle of Jena, when she displayed not only a patriotic spirit, but no little energy and resolution. She was unexpectedly taken ill, and died on a visit to her father in Strelitz, July 19, 1810. Her memory is cherished in Prussia, and the order of Luise in that kingdom was founded in honor of her.

LUITPRAND, or LIUTPRAND, King of Lombardy. See LOMBARDY, *ante*.

LUITPRAND, or LIUTPRAND, 920–72; b. Italy; chancellor of Berenger II., in whose service he went to Constantinople on a diplomatic mission. Having fallen into disfavor with Berenger, he took refuge with the emperor Otho I., who made him bishop of Cremona. He was for a second time ambassador to Constantinople (968–71), and gives an account of his embassy in his *Relatio de Legatione Constantinopolitana*. He also wrote the history of Otho's reign for the years 960–64, the *Historia Othonis;* and the *Antapodosis*, containing the history of Europe from the death of Charles the fat to about 950.

LUKE (*Lucas*), the author of one of the gospels and of the Acts of the Apostles, was b., according to the accounts of the church fathers, at Antioch in Syria, and is said to have been a physician. He was probably by descent a Hellenistic Jew. We learn from Scripture that he was the associate of Paul in his second evangelistic expedition (52 A.D.); but that is all we know; whatever else is asserted concerning him is doubtful. That he was a painter is one of the things for which tradition vouches; and in the church of St. John Lateran at Rome a picture of our Savior is shown which is ascribed to Luke, but is believed to be a work of the 13th century. The churches of Padua, Venice, and Rome also possess many pretended relics of this evangelist. His festival is commemorated by the Roman Catholic church on Oct. 18.—The gospel of St. Luke, addressed to a certain Theophilus, is generally believed to have been written before the destruction of Jerusalem. Rénan, however, in his *Vie de Jesus* (1863), considers its composition subsequent to that event. The time and place of its origin are unknown. See Schleiermacher's *Die Schriften des Luke* (Berlin, 1817). The apocryphal writings ascribed to Luke are *Acta Pauli; Baptismus Leonis;* and *Liturgiæ XII. Apostolorum*.

LUKE, THE EVANGELIST (*ante*), concerning whom all that is certainly known is drawn from his own writings and those of the apostle Paul. That he was not a Jew by birth is indicated by the fact that the apostle, in the epistle to the Colossians, speaks of him separately from those who were of the circumcision. According to his own statement, he had not been numbered among the first eye-witnesses and ministers of the word. Paul calls him the beloved physician. His name does not occur in the Acts, and his presence with Paul is shown by the change in his narrative to the first person plural. By following the clue thus given we learn that he joined Paul at Troas, went with him, on his first entrance into Europe, to Philippi, and was separated from him when Paul and Silas were imprisoned; did not depart with him from the city, and was not with him afterwards until his third departure from Philippi, when he rejoined him, continued with him till he reached Jerusalem, and went with him into the church there; was apparently separated from him during the apostle's imprisonment at Cæsarea; sailed with him on the voyage to Italy, and, after their shipwreck at Malta, went with him to

Rome, where, during the apostle's first imprisonment, he continued his fellow-laborer, as appears from the epistles to Philemon and the Colossians; and remained to the last faithful to him, when others had forsaken him, as Paul declares in his closing words to Timothy, "only Luke is with me." Tradition tells some other things concerning him which may possibly be true, besides many which certainly are false.

LUKE, GOSPEL OF (*ante*), has occupied the third place in the arrangement of the gospels during all the Christian centuries back to the close of the first. The council of Laodicea, and the historian Eusebius in the 4th c., recognized it as one of the canonical books of Scripture; Origen and Tertullian, in the third, frequently quoted it; Irenæus, 180, acknowledged it as Luke's work; the Muratorian fragment, about 170, assigns it the third place; Tatian, also in the 2d c., constructed his *Diatessaron*, a harmony of the four gospels, the third of which was Luke's. Justin Martyr, in his defense of Christianity, presented to the emperor in 139, quotes as in general use among the churches memoirs of Christ which, it is morally certain, were the four gospels. See JOHN, GOSPEL OF. Clement of Rome, about 100, mentions Luke's gospel as one of the Christian books. These writers say that Luke wrote under the general superintendence of Paul. While this opinion is sustained by the long-continued intimacy and confidence existing between the evangelist and the apostle, Luke says in his preface that, having diligently investigated all things from the very beginning, he wrote out an account of the facts which were already fully believed in the Christian church, and in which Theophilus, for whom he wrote, had been orally instructed. The facts had been spread abroad, first, by the preaching and conversation of those who, from the beginning, were eye-witnesses and ministers of the word; and, secondly, by many written accounts rendered necessary by the increasing number of converts to the Christian faith. Luke's work fully justifies his declaration that he had searched out all things from the beginning, as it gives the genealogy of Jesus back to Adam, narrates the annunciation by the angel to Zacharias and to Mary, and records various facts connected with the birth, infancy, and childhood of Jesus which had probably been furnished by Mary herself.

The contents of the gospel are: the preface addressed to Theophilus; the pre-announcement by the angel Gabriel of the birth of John to Zacharias, and of Jesus to Mary; date of the birth of Jesus connected historically with the reign of Augustus; information concerning his birth given by the angel to the shepherds of Bethlehem; account concerning his childhood and youth; date of John's ministry connected historically with the reign of Tiberius and the Roman governors of Palestine; baptism of Jesus, and genealogical table ascending to Adam; the temptations; return to Galilee and ministry there; address at Nazareth; teaching and mighty works in Capernaum; the calling of Peter, James, and John; the leper cleansed; great multitudes of the sick restored, the paralytic forgiven and cured; call of Levi (Matthew) the publican, followed by the feast at which a great number of publicans and sinners were guests; claim of Jesus to be lord of the Sabbath, sustained by restoring the withered hand; the choice of the 12 apostles; multitudes from all parts of the land healed; discourse corresponding with the "sermon on the mount;" the centurion's servant healed; the widow's son raised; the message from John the baptist in prison, the answer returned, and the testimony concerning him; the woman in the Pharisee's house; parable of the sower, and of the lighted candle; the storm on the lake; the man among the tombs, and the demons among the swine; the woman healed by touching the hem of Jesus's garment; the daughter of Jairus raised; the 12 apostles sent forth; Herod perplexed; the 5,000 fed; Peter's avowal of faith; the transfiguration; the evil spirit cast out; the ambition of the disciples condemned, their narrow views corrected, their intolerance reproved; the 70 sent forth and their joyful return; the lawyer's question answered; the good Samaritan; Martha's care and Mary's choice; instructions concerning prayer; demons cast out; the sign of Jonah given to the Jews; the lighted candle used in parable a second time; denunciations against the Pharisees, lawyers, and scribes; warnings against their hypocrisy, and against covetousness, illustrated by the parable of the rich man; counsel to dismiss anxious thought, to trust God's providential care, and give supreme attention to his service; warning against measuring guilt by suffering; the barren fig-tree; the woman healed on the Sabbath; parable of the mustard seed, and the leaven; the strait gate; lamentation over Jerusalem; the man healed on the Sabbath; seeking the chief places at feasts; the great supper and the excuses made; counting the cost, salt losing its savor, parables of the lost sheep, of the lost money, of the prodigal son, of the unjust steward, of the rich man and Lazarus; against offenses; forgiveness to be proportioned to repentance; the power of genuine faith; the ten lepers cleansed; the sudden coming of the Son of man; the unjust judge, the Pharisee and publican; infants brought to Jesus; the young ruler; the death of the Son of man foretold; the blind man at Jericho; Zacchæus the publican; the parable of the pounds; entrance into Jerusalem and lamentation over its doom; cleansing of the temple; question to the chief priests and others concerning John's baptism; the husbandmen and the vineyard; hypocritical question of the Pharisees concerning tribute, scoffing question of the Sadducees concerning the resurrection, and silencing question of Jesus concerning the Messiah; the gifts of the rich men and of the poor widow; the destruction of the temple foretold, with the captivity of the Jews, the treading down of Jerusalem, and the coming of the Son of man; conspiracy

of the chief priests and scribes against Jesus and their covenant with Judas; the passover kept by Jesus and the twelve, with the pre-announcement of the betrayal, of Peter's denial, and the institution of the Lord's-supper; prayer and conflict at the mount of Olives; betrayal, arrest, denial by Peter, condemnation by the council, examination by Herod and Pilate, the latter proclaiming the innocence of Jesus, yet ordering his death; the crucifixion and scenes connected with it; the body given to Joseph and buried by him in a new rock-hewn sepulcher; appearance of angels to the women at the tomb, announcing the resurrection of Jesus; visit of Peter to the spot; appearance of Jesus to two disciples and afterwards to the company of them; expounding of the Scriptures to them, with the direction that the gospel should be preached among all nations, beginning at Jerusalem; ascension of Jesus to heaven from Bethany in the midst of the disciples, and their subsequent thanksgiving and praise.

LULL, RAMON. See LULLY, RAYMOND, *ante*.

LULLY, RAYMOND, "the enlightened doctor," one of the most distinguished men of the 13th c., was b. at Palma, in Majorca, in 1234. In his youth he led a dissolute life, and served for some time as a common soldier; but a complete revulsion of feeling taking place, he withdrew to solitude, and gave himself up to ecstatic meditations and the study of the difficult sciences. This sudden change of life produced in Lully a fervid and enthusiastic state of mind, under the influence of which he formed the project of a spiritual crusade for the conversion of the Mussulmans, an idea he never afterwards abandoned. In pursuance of this project, he commenced an earnest study of theology, philosophy, and the Arabic language; and, after some years, published his great work, *Ars Generalis sive Magna*, which has so severely tested the sagacity of commentators. This work is the development of the method of teaching known subsequently as the "Lullian method," and afforded a kind of mechanical aid to the mind in the acquisition and retention of knowledge, by a systematic arrangement of subjects and ideas. Like all such methods, however, it gave little more than a superficial knowledge of any subject, though it was of use in leading men to perceive the necessity for an investigation of truth, the means for which were not to be found in the scholastic dialectics. Lully subsequently published another remarkable work, *Libri XII. Principiorum Philosoph. contra Averroistas*, and, full of the principles which he had developed in this book, he went to Tunis, at the end of 1291, or the beginning of 1292, to argue with his opponents, face to face. He drew large crowds of attentive hearers, and held disputations with learned Mohammedans, who, however, were as anxious to convert him as he to convert them, and the result, as might have been expected, was that little impression was made by either of the parties. Finally, however, Lully was thrown into prison, and condemned to banishment. After lecturing at Naples for several years, he proceeded to Rome; thence to his native island of Majorca, where he labored for the conversion of the Saracens and Jews; thence to Cyprus and Armenia, zealously exerting himself to bring back the different schismatic parties of the oriental church to orthodoxy. In 1306–7 he again sailed for Africa, entered the city of Bugia (then the capital of a Mohammedan empire), and undertook to prove the truth of Christianity. A tumult arose, in which Lully nearly lost his life. He was again thrown into prison, and treated with great severity; yet so high an opinion was entertained of his abilities, that the chief men of the place were anxious that he should embrace Mohammedanism, and promised him if he did so the highest honors. But to Lully, whose intellect and feelings were both enlisted in the cause of Christianity, this was impossible. After some time he was again banished from the country, and landed (after being shipwrecked) near Pisa. He subsequently went to Paris, and lectured against the principles of Averroes; he also induced the pope to establish chairs for the Arabic, Chaldee, and Hebrew languages in all cities where the papal court resided, and also at the universities of Paris, Oxford, and Salamanca. But his missionary zeal could only be satiated by martyrdom. In 1314 he sailed once more for Africa, and proceeded to Bugia, where he threatened the people with divine judgments if they refused to abjure Mohammedanism. The inhabitants were furious, dragged him out of the city, and stoned him to death, June 30, 1315. The Mayence (10 vols., 1721–42) edition of his works includes several books on alchemy, of which there is not the slightest reason to suppose Lully was the author. Compare Neander's *Kirchengeschichte*, Bohn's translation, vol. vii. pp. 83–96.

LULLY', or LULLI, JEAN BAPTISTE, 1633–87; b. Florence. He was the son of a miller, but having displayed, while still a child, a remarkable natural gift for music, he was spared from following his father's vocation, and educated by a monk in the use of the guitar. Chancing to fall under the notice of the chevalier Guise, he was recommended by that nobleman to Mlle. de Montpensier, the niece of Louis XIV., who engaged him as a page and sent for him to be brought to Paris. He was at this time 14 years of age, and was witty and otherwise gifted; but it appears that he could boast of no personal beauty, and he was accordingly degraded to the kitchen, and began his official life as a *marmiton*, or scullion. He had by this time gained some acquaintance with the use of the violin, and, by devoting all his leisure to practice on that instrument, he succeeded in acquiring considerable mastery over it, and was presently released from his bondage and placed among the 24 violinists attached to the service of the king. He soon undertook composition, and so successfully that the king, having heard him per-

form his own pieces, made him the leader of a new band, called "les petits violons." Lully now rose rapidly; and being at first employed in composing music for the ballets which formed a principal entertainment at the court of Louis XIV., he was appointed superintendent of court music, and finally placed at the head of the académie royale de musique, which the king founded in 1669. His fortune was now assured; and being the king's favorite, he speedily amassed great wealth, and was honored by being made one of the king's secretaries. His death resulted from improper treatment by an unskillful practitioner, after a slight accident which occurred to him while directing a rehearsal. Lully composed 19 operas, besides ballet music and miscellaneous pieces. He has been generally accorded the reputation of being the father of French dramatic music; and even such composers as Handel and Purcell have not hesitated to acknowledge their obligations to him. He was on terms of intimacy with Molière, composed music for some of his pieces, and even acted with success in his comedies. He married, in 1662, Mlle. Lambert, and had 3 sons and 3 daughters. After his death, an inventory of his possessions valued his silver-plate at 16,707 livres; his jewels, etc., 13,000 livres; his ready money, 250,000 livres; his movables at the opera, 11,000 livres; and the house itself, 80,000 livres. Besides these, the rents of several houses, 4,600 livres a year. And, finally, his widow sold his place of royal secretary for 71,000 livres. Up to 1778, Lully's operas continued to hold the public favor; but after that period, Gluck, Piccini, and Paesiello came into fashion, and he was heard no more. One of his operas was *Acis et Galatée*, and was published with a portrait of the composer. The entire 19 of his operas were published in score.

LUMBAGO is a rheumatic affection of the muscles in the lumbar region, or in the small of the back. It is often first recognized by the occurrence of a sharp stabbing pain in the loins upon attempting to rise from the recumbent or sitting position. It is sometimes so severe as to confine the patient to bed and in one position, from which he cannot move without intense suffering; but in milder cases he can walk, although stiffly and with pain, and usually with the body bent more or less forward. It may be distinguished from inflammation of the kidneys by the absence of the peculiar direction of the pain towards the groin, as also by the absence of the nausea and vomiting which usually accompany the disease of the kidney.

The causes of lumbago are the same as those of sub-acute rheumatism generally. The complaint may arise from partial exposure to cold, especially when the body is heated, and violent straining will sometimes induce it. In persons with a strong constitutional tendency to rheumatism, the slightest exciting cause will bring on an attack of lumbago.

The treatment must vary with the intensity of the affection. In most cases, a warm bath at bed-time, followed by ten grains of Dover's powder, will speedily remove it; and as local remedies, a mixture of chloroform and soap-liniment, or the application of the heated hammer (an instrument sold by Coxeter, surgical-instrument maker, London), will be found serviceable. The writer of this article has frequently seen the disorder completely disappear after one application of the hammer, which should be heated in a spirit-lamp to somewhat about 200°, and then be rapidly brought in contact with points of the skin over the painful parts at intervals of about half an inch. Each application leaves a red spot, but blisters seldom occur, if the operation is properly performed.

LUMBER TRADE, including, in its widest sense (in American usage), the commerce in timber for building houses, ships, etc., boards, planks, laths, scantling, shingles, clapboards, railroad ties, telegraph poles, etc., is one of the most extensive and important industries of the United States, and, indeed, of the world. Norway, Russia, and Germany are largely engaged in this traffic, and France cuts a considerable amount of fine timber. Tropical countries furnish dye-woods, veneering, etc. From the West Indies come mahogany, lance-wood, snake-wood, green-heart, etc.; and India, Australia, and New Zealand furnish large supplies of ship-timber. British North America, including Canada, New Brunswick, and Columbia, furnishes lumber to an immense extent. In the United States the most important lumber districts are in Maine, New York, Pennsylvania, Michigan, Illinois, Wisconsin, Minnesota, Indiana, North and South Carolina, Georgia, Florida, the southern portions of Alabama and Mississippi, Texas, northern California, western Oregon, and the region around Puget sound. Indeed, nearly all the states in the union produce lumber in considerable quantities. The most important centers of the trade are Bangor, Me., Boston, Chicago and the lake ports generally, Albany, N. Y., Savannah, Brunswick, Ga., and Pensacola. According to the census of 1870, the number of establishments producing lumber in some form was 26,945; number of men employed, 163,637; capital invested, $161,500,273; wages paid, $46,231,328; total value of products, $252,339,029. Indeed, so extensive is this traffic that many portions of the country are being denuded of trees with a rapidity which excites alarm for the meteorological effects likely to ensue.

LUMINOSITY OF ORGANIC BEINGS. Many organic beings, both vegetables and animals, possess the property of emitting light.

In cryptogamic plants it has been observed on the filaments of *schistostega osmundacea*, one of the order of hepaticæ; in *rhizomorpha subterranea*, belonging to the order

of fungi (which is not uncommon on the walls of dark, damp mines, caverns, etc., and occasionally emits a light sufficiently clear to admit of reading ordinary print); in certain species of *agaricus* (belonging to the same order); and in *thelaphora cærulea* (also a fungus), to which decayed wood owes its phosphoric light.

An emission of light, chiefly in flashes, has been observed in the case of a few phanerogamic plants, among which may be mentioned the garden nasturtium and marigold, the orange lily, and the poppy. In these instances the light has been emitted by the flowers; but cases are also recorded in which the leaves, juice, etc., of certain plants have evolved light. The emission of light from the common potato, when in a state of decomposition, is sometimes very striking. Dr. Phipson, in his work *On Phosphorescence*, mentions a case in which the light thus emitted from a cellarful of these vegetables was so strong as to lead an officer on guard at Strasburg to believe that the barracks were on fire. The phosphorescence in this case is probably due to the same cause as that of decayed wood.

Before proceeding to notice the principal cases in which living animals have been observed to emit light, we shall briefly refer to the emission of light by dead animal matter. The bodies of many marine animals shine after death, but in none is the phenomenon so vivid or continuous as in the well-known boring mollusk the *pholas*. The luminosity of this animal after death was known to Pliny, who said that it shone in the mouths of persons who ate it; and has been made the subject of special investigation by Réaumur, Beccaria, and others. Among other results, they found that a single *pholas* rendered seven ounces of milk so luminous that the faces of persons might be distinguished by it; and that, by placing the dead animal in honey, its property of emitting light, when plunged into warm water, lasted more than a year.

It is universally known that certain kinds of dead fish, especially mackerels and herrings, shine in the dark. From a careful study of the body of a dead stock-fish in a luminous condition, Dr. Phipson finds that the phenomenon is due to a grease which shines upon the fish, and which (as it neither contains phosphorus nor minute fungi, by which the light might have been caused) contains some peculiar organic matter, which shines in the dark like phosphorus itself.

Several cases are on record in which ordinary butcher's meat has presented the phenomenon now under consideration, but their occurrence is so rare that we need not specially notice them. It may be observed that phosphorescent light is not unfrequently observed on the dead human body by persons who visit dissecting-rooms by night. The occasional evolution of light by living human beings will be presently referred to.

The living animals which possess the property of emitting light are extremely numerous, decided cases of phosphorescence having been frequently observed, according to Dr. Phipson, "in infusoria, rhizopoda, polypes, echinoderms, annelides, medusæ, tunicata, mollusks, crustaceans, myriapodes, and insects." Following the arrangement here laid down, we shall mention a few of the organisms in which the phenomenon in question is most remarkable. Among the rhizopoda the *noctiluca miliaris*, a minute animal very common in the English channel, stands pre-eminent. Dr. Phipson relates that he has found it "in such prodigious numbers in the damp sand at Ostend that, on raising a handful of it, it appeared like so much molten lava." It is the chief cause of the phosphorescence of the sea which is so often observed. Among the annelides, earthworms occasionally evolve a shining light like that of iron heated to a white heat. Among the tunicata, a minute animal common in some of the tropical seas, the *pyrosoma Atlantica* resembles a minute cylinder of glowing phosphorus, and sometimes occurs in such numbers that the ocean appears like an enormous layer of molten lava or shining phosphorus. Among the myriapodes, certain centipedes—viz., *scolopendra electrica* and *S. phosphorea*—present a brilliant phosphoric appearance. There is reason to believe that the former will not shine in the dark unless it has been previously exposed to the solar rays. Luminosity in insects occurs in certain genera of the coleoptera and hemiptera, and possibly in certain lepidoptera and orthoptera. Among the coleoptera must be especially mentioned the genus *lampyris*, to which the various species of glow-worms (q.v.) belong, and the genus *elater*, to which the fireflies (q.v.) belong. In the hemiptera there is the genus *fulgora*, or lantern-flies (q.v.), some species of which are highly luminous.

The evolution of light from animals belonging to the vertebrates is extremely rare. Bartholin, in his treatise *De Luce Hominum et Brutorum* (1647), gives an account of an Italian lady, whom he designates as "mulier splendens," whose body shone with phosphoric radiations when gently rubbed with dry linen; and Dr. Kane, in his last voyage to the polar regions, witnessed almost as remarkable a case of human phosphorescence. A few cases are recorded by sir H. Marsh, prof. Donovan, and other undoubted authorities, in which the human body, shortly before death, has presented a pale, luminous appearance.

It is very difficult to give a satisfactory explanation of the above facts. The light evolved from fungi is most probably connected with chemical action, while that emitted in sparks and flashes from flowers is probably electrical. In some luminous animals, a phosphorescent organ, specially adapted for the production of light, has been already detected, and, as anatomical science progresses, the same will probably be found in all organisms endowed with luminous or phosphorescent properties. For full

details on the subject of this article, the reader is referred to Dr. Phipson's work, *On Phosphorescence* (London, 1862).

LUMPKIN, a co. in n. Georgia, drained by the head-waters of the Chattahooche river, called the Chestatee river, and the river Etowah; 400 sq.m.; pop. '80, 6,519—6,513 of American birth, 452 colored. Its surface, presenting features of great natural beauty, is varied by hills covered with forests of ash, hickory, oak, and maple, which hills, rising in the n.w. section, form a part of the Blue Ridge. Gold, granite, iron, lead, silver, and copper represent its mineral wealth; silurian limestone and sandstone are abundant. Its soil is favorable to stock-raising and the production of buckwheat, barley, oats, and grain in general, wool, sweet potatoes, dairy products, and sorghum. It produced in '70, 9,215 lbs. of honey. It had in '70, 3 gold quartz mills, employing 45 hands, with a capital of $21,500, and an annual product of $10,780. Seat of justice, Dahlonega.

LUMPKIN, Joseph Henry, ll.d., 1799–1867; b. Ga.; brother of Wilson. After graduating at the college of New Jersey, he was admitted to the bar, in which he soon attained high rank, but from which he was compelled by ill-health to retire in 1844. In 1845 he became associate justice of the supreme court of Georgia, and soon after was elected chief-justice, a position which he held by successive re-elections till his death. He was the founder of, and a professor in, the Lumpkin law school attached to the state university at Athens.

LUMPKIN, Wilson, 1783–1870; b. Va.; removed to Georgia, entered the bar, and served for several terms in the state legislature. He was a member of congress, 1815–17 and 1827–31; governor of Georgia, 1831–35; and U. S. senator, 1837–41.

LUMP'SUCKER, or Lumpfish (*cyclopterus*), a genus of fishes of the family *discoboli* (q.v.), having the head and body deep, thick, and short, the back with an elevated ridge, the fins rather small, and the ventrals united by a membrane so as to form a sucking disk.—One species (*C. lumpus*) is common on the coasts of Britain, particularly in the northern parts, and is still more plentiful in the seas of more northern regions. It has a grotesque and clumsy form, but its colors are very fine, combining various shades of blue, purple, and rich orange. It attains a pretty large size, and sometimes weighing seven pounds. The lumpsucker preys on smaller fishes. Its sucker is so powerful that a pail containing some gallons of water has been lifted when a lumpsucker contained in it was taken by the tail. Its flesh is insipid at some seasons, but very fine at others, and is much used for food in northern regions. It is often brought to the Edinburgh market. It is known in Scotland as the *Cock Paidle*.

LUMSDEN, Matthew, 1777–1835; b. Scotland; went to India in 1794, and became a magistrate in Calcutta. He was employed as a Persian translator by the East India company, and in 1805 became professor of Persian and Arabic in the college of Fort William, in Bengal. He was afterwards appointed to the superintendency of the Mohammedan college at Calcutta. Besides a number of translations, he published a *Grammar of the Persian Language*, 1810; *Grammar of the Arabic Language*, 1813; and *Selections for the Persian Class*.

LUNA, or Sele'ne, in mythology, the sister of Helios and goddess of the moon. Some writers term her the daughter and others the wife of Helios, and mother of the four seasons. By Jupiter she had a daughter, Pandia; and Hersa (dew) was the offspring of the king of heaven and the goddess of the moon. She was worshiped by the Romans, though not esteemed as one of the important deities. She had, however, a temple on the Palatine, which was illuminated nightly.

LUNA, Alvaro de, 1390–1453; b. Spain; was educated with the infant king, John II., with whom he made his escape from the custody of the infante of Aragon in 1418. He led a successful revolution in behalf of the rights of the crown, and in 1423 was made constable of Castile. He became the favorite minister of the king, but his enemies succeeded in twice driving him from the court, first in 1426, and next in 1439. In 1445 he was victorious in a war against the infantes of Aragon, for which he was rewarded with the grand-mastership of Santiago, which he held together with the dukedom of Truxillo and the lordship of 60 towns and fortresses. He was at last overcome by an intrigue, condemned to death, and executed at Valladolid.

LUNA, Pedro de, 1334–1424; b. Spain; received a cardinal's hat from Gregory XI.; and on the death of the Avignon pope, Clement VII., in 1394, was elected pope by the Avignon cardinals, on condition that he should resign at the request of the college of cardinals, or whenever the pope at Rome should resign, so that a new pope might be chosen, and the great schism ended. Luna took the name of Benedict XIII., and refused to resign when requested; and the Roman pope, Boniface VIII., likewise refused to resign. At a council in Paris, 1398, it was decided to refuse obedience to Benedict; he was besieged in Avignon, but succeeded in making his escape. In 1403 France, the greater part of Spain, Portugal, Scotland, and Sicily had acknowledged him as the lawful pope; but in 1409 the council of Pisa deposed both Benedict and Gregory XII., who had been in the meantime elected pope at Rome, and conferred the tiara upon Pietro Filargo as Alexander V., who died in 1410, and was succeeded by Baltassare Cossa as John XXIII. Spain and Scotland continued to acknowledge Benedict; John XXIII.

and Gregory XII. abdicated, but Benedict refused to do so even after the council of Constance (which had been sitting since 1414) had elected, in 1417, Ottone Colonna as pope Martin V. Benedict withdrew to the fortress of Peniscola in Valencia, and continued in schism till his death.

LUNACY. By the law of England, as well as of all other countries, the presumption is in favor of a man's sanity, even though he be born deaf, dumb, and blind; and if the fact is disputed, it always lies on the party alleging it to prove it. Sometimes a person in a state supposed to be that of a lunatic makes a contract, and is sued upon it; in such a case, he may set up as a defense that he was a lunatic, and the proof will consist of his conduct and actions at and previous to the time in question. If, however, the other party did not know of the lunacy, and took no advantage, the lunatic will not be allowed to recover back moneys which have been paid by him in pursuance of his contract. Though the presumption is in favor of the sanity of a person, yet, when once insanity has existed, the presumption is reversed, and then the law presumes no lucid interval or restoration to sanity until it is proved; and it is extremely difficult to prove a lucid interval, for the law requires very clear and conclusive proof of that fact, and all the circumstances must be carefully scanned. It is difficult or impossible to define in words what is insanity or lunacy, it being a negative state, and merely an inference from the acts, conduct, and bodily condition of the person. An idiot is said to be a person who was born with a radical infirmity of mind, and whose state is one of perpetual infirmity, incapable of cure or restoration; whereas a lunatic is one who is sometimes of good and sound mind, and sometimes not; he has lucid intervals, and is assumed to be more or less capable of restoration to sanity. A person is said to be, in legal phraseology, of unsound mind, who is not an idiot, nor a lunatic, nor yet of a merely weak mind, but, by reason of a morbid condition of intellect, is as incapable of managing his affairs as if he were a lunatic. Though it is difficult to define lunacy or insanity, there are various tests which are more or less accepted in everyday life as strong evidence. Idiocy is accompanied by a vacant look, etc., while insanity is accompanied by some frenzy or extravagant delusion. The physiology of idiocy and lunacy is a separate subject of investigation, and is part of medical jurisprudence, to which a few medical men confine their attention, and their assistance is often required by courts of law when inquiring into this state of mind, though their theories are jealously scrutinized. As a general rule, an idiot or a lunatic is subject to civil incapacity. He cannot enter into contracts or transact general business, and what he does is a nullity. Thus he cannot make or revoke a will, or enter into marriage, or act as an executor or administrator, or become a bankrupt, or be a witness in a court of justice, or vote at elections, and such like. But, as a general rule, a lunatic is liable in damages for committing a wrong, such as a trespass, and he is liable for necessaries supplied to him, and he may be arrested for debt, and his property may be taken in such cases, as in the case of sane persons. With regard to criminal responsibility, the law was fully considered in the case of McNaughton, who, in 1843, shot Mr. Drummond at Charing Cross by mistake for sir Robert Peel, and the English judges were called on by the house of lords to state their opinion as to the right mode of putting the questions to a jury when the defense of insanity is raised. The judges said that a person laboring under an insane delusion as to one subject is liable to punishment, if at the time of committing the crime he knew he was acting contrary to law. In general cases, to establish want of responsibility, it must be proved that the party accused was laboring under such a defect of reason, from disease of mind, as not to know the nature and quality of the act he was doing, or, if he did know it, that he did not know he was doing what was wrong. Where the party is laboring under an insane delusion as to existing facts, and commits a crime in consequence thereof, it depends on the nature of the delusion whether he is excused. Thus, if he insanely believes that A intended to kill him, and he kills A, as he supposes, in self-defense, he would be exempt from punishment. But if his delusion was that A had inflicted a serious injury to his character and fortune, and he killed A in revenge for such supposed injury, then he would be liable to punishment. When a person is acquitted of crime on the ground of insanity, he is liable to be confined in prison during her majesty's pleasure.

So long as a person is not actually declared insane or an idiot, he has a right to manage his own affairs; and the only way, in England, in which he can be deprived of such right used to be by a writ *de lunatico inquirendo*, issuing out of chancery, which authorized the impaneling of a jury to decide whether he was a lunatic or not. The custody and care of lunatics were vested in the crown; and the lord chancellor, as the depositary of this jurisdiction, issued the writ on petition. The practice has now been considerably altered by various statutes, but, as a general rule, it is still the law, that, unless a person has been officially declared a lunatic, either by the verdict of a jury, or by a certificate of a master in lunacy, he is still entitled to manage his own affairs. In England and Ireland, there is no intermediate state called imbecility or weakness of mind, with which the law interferes, as there is in Scotland (see INTERDICTION, IMBECILITY), and hence, if a weak person is imposed on, it is treated merely as a case of fraud, the weakness forming an element of such fraud; but there is no machinery for restraining the natural right, even of weak-minded persons, to do what they like

with their property. As regards idiots and lunatics, the mode in which they are judicially declared to be so, is as follows: There are certain persons called masters in lunacy, whose business it is to conduct the inquiries which are necessary, and preside over the jury, and they also visit lunatics in certain cases. The commissioners of lunacy form a board, which supervises generally the lunatic asylums and licensed houses for reception of lunatics. The incapacity of a lunatic or idiot is conclusively established by the verdict of a jury under an inquisition *de lunatico inquirendo*, held before a master in lunacy; or, if the case is too clear for a jury, and where the party has not mental capacity to declare his wish on the subject, by a certificate of a master in lunacy. The lord chancellor may direct the trial to take place before one of the common-law judges, and the evidence is to be confined to the lunatic's conduct during the previous two years only. The costs of the trial are in the lord chancellor's discretion. If the party has property, the lord chancellor then appoints, on petition, a committee of the estate or of the person of the lunatic, and the visitors in lunacy must visit such lunatic at least once a year, unless the lunatic is in a private house unlicensed, in which case he must be visited four times each year. The lunatic is thus kept under the immediate control of the court of chancery, which manages his property through the agency of the committee and of the visitors in lunacy. But as many lunatics have no property, or property of a trifling nature, it has long been found necessary to provide asylums and registered houses for the reception of lunatics, all which are more or less under the control of the commissioners in lunacy. Houses kept for the reception of lunatics are either provided by the counties, and called county asylums, or they are hospitals founded by charitable donors, or they are mere private houses, kept for purposes of profit by individuals. County asylums were first established in 1808 (see LUNATIC ASYLUM). The justices of every county are bound to provide such an asylum, or to join with some other parties in keeping one, the expense being defrayed out of the county rates, and a committee of justices being appointed as visitors, to see that the statute is complied with. The object of the county asylum is to receive the lunatic paupers of the county. As a general rule, it is incumbent on the parish officers of each parish to report to the neighboring justices any case of a lunatic pauper being in their parish. In some cases of a harmless description, such paupers may be kept in the workhouse; but in other cases, on the matter being reported to the justices, the latter order the paupers to be brought before them for examination, and then send them to the county asylum; the parish to which the pauper belongs—i.e., in which he is legally settled—being liable to defray the maintenance; but if the parish which is legally bound to support the pauper cannot be discovered, then the expense is to be charged to the county. If the pauper cannot be examined by the justices, the medical officer and a clergyman may sign a certificate, which is taken to be evidence of the lunacy. As to private houses, no person is allowed to receive two or more lunatics, unless such house has been previously licensed by the commissioners in lunacy, which license is only given after inspection, and a report as to its sanitary arrangements and other items of management. No person can be legally received into such licensed house without a written order from the person sending him, and the medical certificates of two physicians, surgeons, or apothecaries. The keepers of such houses are liable to visitation by the commissioners, and to render regular reports as to all particulars concerning the admission, death, removal, discharge, or escape of patients. The commissioners have power to visit at unexpected times, and to receive reports from other visitors. The commissioners may discharge persons who seem to be detained without sufficient cause.

In Scotland, the law differs in several respects from the above. Idiots and lunatics are often called fatuous and furious persons respectively; and there is an intermediate state called imbecility or weakness of mind, upon evidence of which the relations may apply to the court of session for judicial interdiction (q.v.), which has the effect of protecting the imbecile from squandering his heritable property. The care and custody of lunatics and idiots belong to the court of session, which may appoint a *curator bonis* or judicial factor to take charge of the estate, and a curator or tutor dative to take charge of the lunatic's person. A party is cognosced as a fatuous or furious person by a jury presided over by the sheriff. The recent statutory provisions concerning Scotch lunatics are contained in the statutes 20 and 21 Vict. c. 71, 21 and 22 Vict. c. 89, and 25 and 26 Vict. c. 54. There is also a board called the commissioners in lunacy for Scotland, who may grant licenses for private asylums. They may also give special licenses to occupiers of houses for the reception of lunatics, not exceeding four in number, subject to rules and regulations. Counties and parishes may contract for accommodation of their lunatic paupers. Minute provisions are contained in these statutes as to the mode of treatment and visitation of lunatics, which, in leading points, resemble those regulating the practice in England.

LUNACY (*ante*). Courts of justice concern themselves with the subject of insanity only so far as they find it necessary in determining the competency or the responsibility of persons upon whose acts they are required to pass judgment. To the speculations of the psychologist or his labored attempts to find a scientific solution of all the difficulties in which the subject is involved they pay little heed, but carefully limit themselves to the one practical issue with which they have to deal. If an attempt be made to invali-

date a contract or a will on the ground of insanity, the question to be decided is whether the maker was in the possession of his faculties to such a degree as to enable him clearly to understand his obligations and duties, and to protect his own interests; and, even if it be proved that he was in some respects insane, his acts will not, therefore, be regarded as void *ab initio*, but only as voidable if they are shown to be irrational and wrong. If a lunatic buy for himself or his family the necessaries of life, the act being proper and rational in itself and injurious to no one, his estate will be liable for the debt thus incurred; and if he make a will just in itself and injurious to none, it will be respected and enforced. In the case of a criminal in whose behalf the plea of insanity is set up, the question is whether he was in a condition to understand the nature of his act, and had the power of doing or abstaining from doing it. Neither drunkenness nor heat of blood will be accepted as an excuse, for the law assumes that a man is bound to keep his appetites and passions under control. Nor can mental weakness exempt from responsibility for crime, unless it be proved that it was the offspring of disease, and that the disease overpowered the reason and the will. Congenital imbecility, though similar in some of its effects to insanity, is yet not to be confounded therewith, but to be treated upon its own ground. The law knows nothing of any form of insanity that does not spring from bodily disease. No crime, however atrocious, is regarded in law as evidence in itself of insanity, responsibility being assumed until mental unsoundness, the fruit of disease, is proved. No other department of human evidence has led to such interminable debate in courts of law as this. However the common mind may judge as to the application of these principles, and though in their application courts may sometimes have been confused, for the most part our jurisprudence has in this respect proceeded upon the safe ground of common sense. Scientific experts have been allowed great latitude in expounding their theories, but judges have generally been careful, in considering the subject, to keep their feet upon the solid earth, not wandering readily or far from established precedents. The subject is regarded in law under three aspects—insanity, partial insanity, and mental unsoundness. When the reasoning faculties are under constant duress and mental incompetency seems to be a permanent condition of the mind, the law deals with the person as insane, and holds his acts to be voidable, though not necessarily void, as they may sometimes be rational and right. Partial insanity is said to exist when a man is insane in some particulars while perfectly rational in others. In such cases the law has simply to decide how far his acts are rational; and in whatever degree they are so, it will treat them as it would those of a sane person. If a partially insane person make a will or enter into a contract, it will be sustained if no evidence of mental disorder appears upon the face or in the substance of the instrument. Those who deal with a person known to be partially insane do it, however, at their peril. Mental unsoundness is not necessarily the result of any appreciable disease, but may arise from the natural decay of the mental powers in consequence of inherited weakness, or from drunkenness or some other vice. Persons in this condition are not necessarily dangerous to themselves or others, but in some spheres of labor may even be useful. What degree of mental unsoundness in any particular case will justify and require guardianship is a question for the courts to decide. See IMBECILITY, LUNACY.

LUNALILO', WILLIAM CHARLES, sixth king of the Hawaiian islands, 1835–74; b. Honolulu. He was a descendant of Kamehameha I. Kamehameha V., called Lot, being unmarried and dying without naming a successor, prince Lunalilo, a chief of a high family, was chosen king Jan. 1, 1873, and crowned on the 9th. He was educated at the royal school established by the missionaries at Honolulu in 1839. He, with his cousins, Kamehameha IV. and V., received there a good education, showing special taste for literature and poetry. In 1860 he visited California with Lot and David, the first preceding, the last succeeding him as king. Lunalilo, before his accession, was dissipated, but reformed and made a good and popular ruler. After reigning one year and twenty-five days he died without naming a successor, and David Kalakaua was appointed king by the legislature.

LUNAR CAUSTIC is the term applied to the fused nitrate of silver when cast into small cylinders. It is, when freshly prepared, of a whitish striated appearance; but on exposure to the air the outer surface becomes decomposed and blackens.

The uses of lunar caustic in surgery as a caustic are numerous. It is a useful application to punctured and especially to poisoned wounds. When applied to large indolent ulcers it acts as a stimulant, and restores a more healthy action. It is used to remove and keep down spongy granulations (popularly known as proud flesh) in wounds and ulcers, and to destroy warts. It has been applied with good effect to the pustules in small-pox, in order to cut short their progress and to prevent pitting. It is of great service as a local application in inflammatory affections and ulcerations of the mucous membrane of the mouth and throat. In fissured or excoriated nipples its application gives great relief. It should be insinuated into all the cracks, and the nipple afterwards washed with tepid milk and water. It is also extensively employed in diseases of the eye, of the genito-urinary organs, and in some forms of skin disease.

LUNAR CYCLE. See METONIC CYCLE.

LUNAR THEORY, a term employed to denote the *à priori* deduction of the moon's motions from the principles of gravitation. See MOON.

LU'NATIC ASYLUM. The first hospitals for the insane of which history or tradition makes mention were the sacred temples in Egypt. In these, it is said, the disease was mitigated by agreeable impressions received through the senses, and by a system resembling and rivaling the highest development of moral treatment now practiced. Monasteries appear to have been the representative of such retreats in the mediæval Christian times; but restraint and rigid asceticism characterized the management. Out of conventual establishments grew the bethlems, or bedlams, with which our immediate ancestors were familiar (see BEDLAM). But, apart from such receptacles, the vast majority of the insane must have been neglected; in some countries, reverenced as specially God-stricken; in others, tolerated, or tormented, or laughed at, as simpletons or buffoons; in others, imprisoned as social pests, even executed as criminals. In a few spots, enjoying a reputation for sanctity, or where miraculous cures of nervous diseases were supposed to have been effected, such as Gheel and St. Suaire, communities were formed, of which lunatics, sent with a view to restoration, formed a large part, and resided in the houses of the peasants, and partook of their labor and enjoyments. Asylums, properly so called, date from the commencement of the present century; and for many years after their institution, although based upon sound and benevolent views, they resembled jails both in construction and the mode in which they were conducted, rather than hospitals. Until very recently, a model erection of this kind was conceived necessarily to consist of a vast block of building, the center of which was appropriated to the residence of the officers, the kitchen and its dependencies, the chapel, etc., from which there radiated long galleries, in which small rooms, or cells, were arranged upon one or both sides of a corridor or balcony, having at one extremity public rooms, in which the agitated or non-industrial inmates, as the case might be, spent the day, while the more tractable individuals were withdrawn to engage in some pursuit, either in workshops, clustered round the central house, or in the grounds attached, which were surrounded by high walls, or by a ha-ha. The population of such establishments, when they were appropriated to paupers, ranged from 100 to 1400 patients. These were committed to a staff composed of a medical officer, matron, and attendants, to whom were directly intrusted the management, discipline, and occupation of the insane, in accordance with regulations or prescriptions issued by the physician. A gradual but great revolution has taken place in the views of psychologists as to the provisions and requirements for the insane during seclusion. As a result of this change, asylums, especially for the wealthy classes, are assimilated in their arrangements to ordinary dwelling-houses; while it is proposed to place the indigent in cottages in the immediate vicinity of an infirmary, where acute cases, individuals dangerous to themselves or others, or in any way untrustworthy, could be confined and actively treated, as their condition might require. In all such establishments, whether now entitled to be regarded as cottage asylums or not, the semblance and much of the reality of coercion has been abolished; the influence of religion, occupation, education, recreation; the judicious application of moral impressions; and the dominion of rational kindness and discriminating discipline, have been superadded to mere medical treatment, and substituted for brute force, terror, and cruelty.—Esquirol, *Des Maladies Mentales*, t. ii.; Guislain, *Sur l'Alienation Mentale;* Browne on *Asylums*, etc.; Conolly on *Construction of Asylums.*

LUNAWAU'RA, a small state of India, under British protection, in the Rewa Caunta division of Guzerat. It is situated on the confines of Guzerat, and is a continuation of the mountain tract which forms the extreme n.e. of that province. The capital, from which the state derives its name, is 160 m. n.w. from Indore, on the left bank of the Mahi, or Myhee, a river which flows into the gulf of Cambay, and is in n. lat. 23° 8′, e. long. 73° 37′. It is a fortified town, the fortifications and town together being about 3 m. in circumference; and is a place of considerable trade. Area of state, 150 sq.m.; pop. '72, about 75,000.

LUND (*Londinum Gothorum*), a city of Gothland, in the extreme s. of Sweden, and in an extensive and fertile plain 30 m. s.e. of Helsingborg. Its population, in 1874, was 11,680; but it was once much larger, when it was the chief seat of the Danish power in the Scandinavian peninsula, and for a long period the capital of the Danish kingdom. The principal building is the cathedral, the lower part of which is as old as the 11th century. It has manufactures of cloth, tobacco, and leather. Lund is one of the oldest towns in Scandinavia; in 920 it was taken and plundered by a band of *vikings;* it was the see of a bishop from the time of the introduction of Christianity, and from 1104 its archbishop long exercised jurisdiction over all Denmark, Sweden, and Norway. Lund has a university, founded in 1628, which has now 30 professors and 500 students, a library of 100,000 volumes, and some thousands of manuscripts, an excellent zoological museum, and a botanic garden.

LUNDY, BENJAMIN, 1789–1839; b. Hardwich, Suffolk co., N. J., of Quaker parentage; had no advantages of education, save those afforded by the common-schools; was imbued with a keen thirst for knowledge, and read eagerly such books as were within his reach. While serving an apprenticeship to the saddler's trade in Wheeling, Va., his heart was touched with sympathy and indignation at the sight of coffles of slaves passing through that place on their way to a southern market, and he resolved to give his life to the work of abolishing slavery. Having completed his apprenticeship, he mar-

ried, and settled in St. Clairsville, Ohio, where he carried on the business of a saddler for four years, accumulating a considerable sum of money. His pecuniary prospects were highly flattering, but the remembrance of the slave was ever with him. Accordingly, he persuaded five others to join him in organizing a "union humane society," which, in a few months, enrolled nearly 500 members. A short time after this he began to discuss the subject of slavery in the *Philanthropist*, a weekly paper published in Mt. Pleasant, Ohio. In the autumn of 1819, the agitation of the "Missouri question" being then rife in the country, he took his whole stock in trade to St. Louis, resolved to sell it and devote the proceeds to the promotion of the antislavery cause. He lost by this venture nearly all that he had accumulated; but this did not discourage him in his chosen course. He devoted himself for a time to the work of exposing the evils of slavery in the newspapers of Missouri and Illinois, hoping in this way to create a public sentiment averse to the admission of Missouri to the union as a slave state; but he soon returned to Ohio, settling at Mt. Pleasant, where, in Jan., 1821, he began the publication of a monthly journal entitled the *Genius of Universal Emancipation*. This paper was shortly afterwards removed to Jonesborough, Tenn., where there was a considerable body of people who shared his hostility to slavery and gave him a warm welcome. In 1824 it was removed to Baltimore, Md., where it was published weekly. Mr. Lundy, while averse to the scheme for colonizing the negroes in Africa, was yet imbued with the idea that some place of refuge outside of the United States was necessary as a means of promoting emancipation; and, in 1825, he visited Hayti, where he sought to make arrangements with the government for the settlement of such emancipated slaves as might be sent thither. In 1828 he journeyed on foot through parts of the middle and eastern states to lecture on slavery and procure subscribers to his paper. He found a few friends ready to aid him, but the people in general had grown apathetic on the subject since the admission of Missouri to the union as a slave state. In the winter of 1828–29 Mr. Lundy was brutally assaulted and nearly killed by Baltimore's great slave-dealer, Austin Woolfolk, who had taken offense at something which had been said of him and his nefarious business in the *Genius of Universal Emancipation*. In the spring of 1829 he made a second visit to Hayti, taking with him a small number of emancipated slaves, for whom he sought an asylum. In the fall of the same year William Lloyd Garrison, by invitation, joined him in Baltimore as co-editor of the *Genius*. The two men were alike in their hostility to slavery, but Mr. Garrison was a pronounced advocate of immediate emancipation, while Mr. Lundy, like most of the antislavery men of that day, was a gradualist, fearing, if not believing, that a sudden emancipation would be dangerous to the public welfare. Mr. Garrison, too, was for emancipation on the soil, while Mr. Lundy was committed to schemes of colonization abroad. When about half the first year of their partnership had expired, Mr. Garrison was convicted of a criminal libel, fined, and thrust into prison for declaring that the domestic traffic in slaves was, in its nature, as piratical as the foreign, and that a New England sea-captain, who had taken a cargo of human flesh from Baltimore to New Orleans, was guilty of conduct which should cover him with "thick infamy." This occurrence led to a dissolution of the partnership between Mr. Lundy and Mr. Garrison, the former continuing the publication of the *Genius*, but making Washington the place of its nominal issue, while it was printed once a month in whatever place he found it convenient to stop for that purpose in the course of his travels. In the winter of 1830–31 he visited the Wilberforce colony of fugitive slaves in Canada, and soon afterwards went to Texas, for the purpose of securing a similar asylum under the Mexican flag. He went to Texas again in 1833, but was baffled in his purpose on account of the scheme for wresting that country from Mexico, and annexing it to the United States. In 1836 he commenced the publication, in Philadelphia, of an antislavery paper, entitled the *National Enquirer*, absorbing therein the *Genius of Universal Emancipation*. A year later he resigned the editorship of the new paper, and in the winter of 1838–39 removed to Lowell, La Salle co., Ill., intending to resume there the publication of the *Genius*, but on the 22d of the ensuing October he died. He was a man of rare courage and self-sacrifice, a pioneer in the movement for the abolition of American slavery. He traveled more than 5,000 miles on foot, and upwards of 20,000 miles in other ways, visiting 19 states of the union, and addressing hundreds of public meetings, to promote the object to which he had devoted his life.

LUNDY ISLE, an island of Devonshire, England, in the mouth of the Bristol channel. It is about 3 m. in length from n. to s., and 1 m. in breadth, having an area of 1800 acres. Its s. point is about 12 m. from Hartland point, on the coast of Devonshire, and its n. end about 29 m. from St. Gowan's head, in Wales. Its shores are rocky and precipitous, and approach to them is rendered dangerous by numerous detached or insular rocks. There is only one landing-place, which is on the s. side, and near it are dangerous reefs and insulated rocks. The pop. in 1871 was 144. Near the southern end of the island is a light-house, on a height 567 ft. above the sea. At an early date this island is said to have belonged to a family named Morisco, one of whom having conspired against the life of Henry III., fled hither, and became a pirate. Lundy Isle was the scene of a remarkable occurrence in the reign of William and Mary. A party of Frenchmen landed from a ship of war under Dutch colors, on pretense of desiring to bury one of the crew in consecrated ground, the coffin being really filled with arms, with

which the party armed themselves in the church, having requested the islanders to leave them alone to their own funeral rites, and issuing forth, they desolated the island, hamstringing the horses and bullocks, flinging the sheep and goats over the cliffs, and stripping the inhabitants even of their clothes. The cliffs of Lundy isle are the resort of multitudes of gannets, or solan geese. Granite is the rock chiefly prevailing in the island, but slate appears at its s. end.

LUNDY'S LANE, BATTLE OF, July 25, 1814. While the American army, 3,000 strong, were in camp at fort Chippewa, on the Niagara river, opposite Buffalo, under command of gen. Brown, intelligence was received at noon that the British gen. Drummond had crossed the Niagara at Queenstown to attack fort Schlosser, the American depot of supplies. Gen. Brown immediately sent col. Winfield Scott (afterward gen.) with 1200 men to make a demonstration on Queenstown. Near sunset, gen. Scott found himself approaching a strong force of the British, posted behind a belt of woods on an eminence, supported by a battery of nine guns, and commanded by gen. Rial. This position was at the head of Lundy's lane, 1½ m. from Niagara Falls. Scott seeing the strength of force opposed, sent back to gen. Brown for support, and at once ordered maj. Jessup with the 25th regiment to attack the English on the left flank, and himself occupied their attention by a vigorous attack in front. Jessup's flank attack was successful, and resulted in the capture of the English gen. Rial. But on the front col. Scott met a galling resistance. Gen. Brown arrived with reinforcements in the evening, and gen. Drummond had arrived and reinforced the enemy. An attack was ordered on the front to capture the English battery. Under cover of the darkness two regiments were pushed forward. The first was repulsed by timely discharges of grapeshot, but col. Scott at the head of the second succeeded in capturing the battery, turned it against the enemy, and enabled gen. Brown to hold the hill in force against three desperate assaults of the English troops to regain possession. The struggle closed at midnight by the withdrawal of the British troops. Considering the small forces engaged, it was a sanguinary battle. Gen. Drummond, as well as gen. Brown and col. Scott, were wounded, the latter severely. After the battle the command devolved on gen. Ripley, who for lack of force was obliged to leave the trophies of the evening's victory, and to retire to fort Chippewa. The American loss in killed and wounded was 743; the British, 878.

LÜNEBURG, formerly a principality in Lower Saxony, now a district in the province of Hanover. Area, 4,293 sq.m.; pop. '71, 384,210, mostly Protestants. The Elbe forms its northern boundary. Great part of the country is occupied by the Lüneburg Heath. See HANOVER.

LÜNEBURG, a t. of Hanover, in the province of the same name, is situated on the river Ilmenau, 24 m. s.e. of Harburg by railway. It is mentioned as early as the age of Charlemagne, and was formerly an important Hanseatic town. It is surrounded with high walls and towers, and possesses many ancient buildings. The trade is considerable. In the immediate vicinity of Lüneburg is the salt-work of Sülze, discovered in the 10th c., and still very productive. Close by is a hill 200 ft. high, with rich seams of lime and gypsum. Pop. '71, 16,284. It was at Lüneburg that the first engagement took place in the German war of liberation, April 2, 1813. About 16 m. to the s.w. of the town, in the Lüneburg Heath, lies the Göhrde, a beautiful forest, with a royal hunting-lodge.

LUNEL, a t. in the s. of France, department of Herault, 14 m. e.n.e. of Montpellier, has a pop. ('72) of 6,973, and a considerable trade in Muscatel wine and raisins. Near it is a cave, important for the fossil bones found in it.

LUNENBURG, a co. in s.e. Virginia, intersected in the extreme s.w. by the Richmond and Danville railroad; bounded on the n.e. by the Nottoway river, and on the s. by the river Meherrin; 410 sq.m.; pop. '80, 11,535—11,434 of American birth, 6,924 colored. Its surface is uneven, and tolerably well wooded. A large proportion of the soil is fertile, and furnishes good grazing facilities. Its leading productions are: tobacco, wool, sweet potatoes, oats, corn, wheat, sorghum, and the products of the diary. Cattle, sheep, and swine are raised. It produced in '70, 3,900 lbs. of honey. Its water-power is utilized by flour and saw mills. Seat of justice, Lunenburg Court-House.

LUNENBURG, a co. in s.e. Nova Scotia, having the Atlantic ocean for its e. and s.e. boundary, drained by Sherbrooke lake in the n., and other small lakes and rivers, including the La Have, emptying into Mahone bay, and thence into the ocean; 1115 sq.m.; pop. '70, 23,834. Its soil is fertile, and its inhabitants are largely engaged in deep sea fishing and in the West India trade. Foreign vessels, which frequently visit its ports, find good anchorage and safe shelter in its harbors and bay. In the n.e. is Chester basin, a small bay, containing, it is said, 365 beautiful little islands. Its industries are represented by spacious yards for ship-building and repairs, tanneries, and saw, mills, and it exports lumber and wood. In the e. section are alkaline springs. Seat of justice, Lunenburg.

LUNENBURG, a thriving seaport of Nova Scotia, the capital of Lunenburg co.; pop. 1500. It was settled by Germans in 1753, and many of the present inhabitants are of

German descent. Its principal exports are fish and lumber. It has considerable trade with the West Indies. It has a deep, capacious, and well-sheltered harbor. Gold is found in the neighborhood.

LUNETTE', in fortification, is a small work beyond the ditch of the ravelin, to supply its deficiency of saliency, and formed at the re-entering angle made by the ravelin and bastion. The lunette has one face perpendicular to the ravelin, and the other nearly perpendicular to the bastion. See FORTIFICATION.

LUNÉVILLE, a t. in the department of Meurthe-et-Moselle, in France, at the confluence of the Meurthe and the Vezouse, is a regularly built and unwalled town. Pop. '72, 11,929. It was formerly a frequent residence of the dukes of Lorraine, and their palace is now used as a cavalry barrack. Lunéville has manufactures of cotton and worsted goods, embroidery, and earthenware. It is one of the largest cavalry stations in France. The town has a historic celebrity from the peace of Lunéville, concluded here on Feb. 9, 1801, between Germany and France, on the basis of the peace of Campo-Formio (q.v.).

LUNGS. See RESPIRATION, ORGANS OF.

LUNGWORT, or OAK-LUNGS, *Sticta pulmonaria*, a lichen with a foliaceous leathery spreading thallus, of an olive-green color, pale brown when dry, pitted with numerous little cavities and netted, much lacerated; the shields (*apothecia*) marginal, reddish brown with a thick border. It grows on trunks of trees in mountainous regions, in Britain and other European countries, sometimes almost entirely covering them with its shaggy thallus. It has been used as a remedy for pulmonary diseases. It is nutritious, and, when properly prepared, affords a light diet, capable of being used as a substitute for Iceland moss; yet it is bitter enough to be used as a substitute for hops. It yields a good brown dye.—The name *lungwort* is also given to a genus of phanerogamous plants (*pulmonaria*), of the natural order *boragineæ*. The common lungwort (*P. officinalis*) is a rare and rather doubtful native of Britain, although common in some parts of Europe. It has ovate leaves and purple flowers, and was formerly employed in diseases of the lungs, but seems to have been recommended chiefly by a fancied resemblance to the lungs in its spotted leaves. It is mucilaginous, and slightly emollient. It contains niter in considerable abundance. It is used in the north of Europe as a pot-herb.

LUNT, GEORGE, 1803; b. Mass.; educated at Harvard university, graduating in the class of 1824, studied law, was admitted to the Essex co. bar, and commenced practice in Newburyport, Mass., in 1831, where he had been at one time principal of the high school. He served several terms in the legislature of his state, being elected to a seat in both branches. In 1839 he published a small volume of poems, which was followed by others in '43, '51, and '54, comprising *The Age of Gold, and other Poems*, and *Lyrics, Poems, Sonnets, and Miscellanies*. In 1845 he read a poem entitled *Culture* before the Boston mercantile library association. In 1848 he removed to Boston, and in the following year was appointed U. S. district attorney by president Taylor, holding the position until 1853, when, under a change of administration, he resumed the private practice of the law. In 1857 he became editor-in-chief of the Boston *Daily Courier*, exerting a marked influence on the democratic politics of the period, and in the same year he wrote *Three Eras of New England*. In 1858 he published *Radicalism in Religion, Philosophy, and Social Life;* in 1860, *The Union*, a poem; and in 1866, *Origin of the Late War*. Other works are: *Eastford; or, Household Sketches by Wesley Brooke*, a novel; and *Julia*, a poem. His writings are distinguished for a finished, brilliant style, the vehicle of vigorous thought.

LUPERCA'LIA, a festival among the ancient Romans, held on Feb. 15, in honor of Lupercus, the god of fertility. When Rome began to seek a Grecian origin for its religious ceremonies, Lupercus was identified with Lycæan Pan, and his worship was said to have been introduced by Evander, the Arcadian. Modern scholars place no value on such statements. Lupercus is believed by them to have been one of the oldest pastoral deities of Italy, and everything that is known regarding him and his rites favors this view. These rites were of the rudest and most primitive character, and indicate a high antiquity. Goats and dogs were sacrificed; afterwards the priests (called Luperci) cut up the skins of the victims and twisted them into thongs, with which they ran through the city striking every one who came in their way (which women used to do) in hopes that the god of fertility would be propitious towards them. As the festival is believed to have been at first a shepherd one, this running about with thongs is understood to have been intended as a symbolical purification of the land. The place where the festival was held was called the Lupercal, and was situated on the Palatine hill. It contained an image of Lupercus, covered with a goat's skin. Lupercalia were also held in other cities of Italy.

LU'PINE, *Lupinus*, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, mostly annuals, but some of them perennial herbaceous plants, some half shrubby, and generally having digitate leaves, with rather long stalks. The flowers are in racemes or spikes, the calyx two-lipped, the keel beaked, the filaments all united at the base. The species of lupine are numerous, and are chiefly natives of the countries near the Mediterranean sea, and of the temperate parts of North and South America.

The WHITE LUPINE (*L. albus*), a species with white flowers, has been cultivated from time immemorial in the south of Europe and in some parts of Asia for the sake of the seeds, which are farinaceous, and are used as food, although when raw they have a strong, disagreeable, bitter taste, which is removed by steeping in water and boiling. They were a favorite kind of pulse amongst the ancient Greeks and Romans, and still are so in some parts of the south of Europe, although generally disliked by those who have not been accustomed to them. They are used in many countries for feeding cattle, particularly draught-oxen.—The YELLOW LUPINE (*L. luteus*), so called from its yellow flowers, and the EGYPTIAN WHITE LUPINE (*L. termis*), which has white flowers tipped with blue, are also cultivated in the south of Europe, Egypt, etc., for their seeds, which are similar in their qualities to those of the white lupine.—In many countries, lupines, and particularly the white lupine, are cultivated to yield green food for cattle, and also to be plowed down for manure. They grow well on poor and dry sandy soils, which by this process of green-manuring are fitted for other crops. Many species of lupine are cultivated in our flower-gardens, having beautiful white, yellow, pink, or blue flowers. The flowers of some species are fragrant. No lupine is a native of Britain. *L. perennis* adorns sandy places from Canada to Florida with its fine blue flowers.

LU'PULINE. See HOPS.

LUPUS is a chronic disease of the skin, in which dull or livid tubercles are developed, which have a tendency to destroy or seriously to affect the adjacent tissues, with or without ulceration, and commonly ending in indelible cicatrices. It was formerly known as *noli me tangere*. The disease usually attacks the face, especially the alæ of the nose and the lips, but is sometimes met with elsewhere. It is a terrible disease, but is happily of rare occurrence. It derives its name from the Latin word for *a wolf*, in consequence of its destructive nature.

Lupus usually commences with the appearance of one or two circular or oval, dull-red, somewhat translucent tubercles, about two lines in diameter. After a time, these tubercles increase in number and size, and take on new characters. They may ulcerate, constituting the variety known as *lupus exedens*, in which case the ulceration may pursue a superficial or a deep course. Scabs are formed over the ulcers; and, as these scabs are thrown off, the ulcer beneath is found to have increased in extent, till great destruction of the soft parts and (in the case of the nose) of the cartilages is effected. The ulcer of lupus has thick red edges, and exudes a fetid, ichorous matter, in considerable quantity. When they do not ulcerate, the tubercles are softer than in the previous variety, and form patches of considerable extent, the intervening skin and cellular tissue also swelling and exhibiting here and there dull-red points, which are the summits of the imbedded tubercles. The lips become much enlarged, the nostrils closed with the swelling, the eyelids everted, and the whole face hideous. This variety is known as *lupus non exedens*.

The progress of lupus is usually slow, and the sufferings of the patient less than might be expected, in consequence of the sensibility of the parts being diminished from the first. The complaint may continue for years, or even for life, but is seldom fatal. Its causes are not well known, but it is thought that a scrofulous habit and intemperance predispose to the disease. Both sexes are liable to it, but it seems most common in women. It is not contagious.

The internal treatment consists in the administration of cod-liver oil and the preparations of iodine, especially Donovan's solution, while locally strong escharotics should be applied. The disease, is, however, so serious, that whenever there is a suspicion of its nature, professional aid should be sought.

LURCH'ER, a kind of dog, somewhat resembling a greyhound, and supposed to derive its origin from some of the old rough-haired races of greyhound crossed with the shepherd's dog. It is lower, stouter, and less elegant than the greyhound, almost rivals it in fleetness, and much excels it in scent. It is covered with rough wiry hair, is usually of a sandy red color, although sometimes black or gray, and has half-erect ears and a pendant tail. It is the poacher's favorite dog, possessing all the qualities requisite for his purposes, in sagacity rivaling the most admired dogs, and learning to act on the least hint or sign from its master. Of course, it is detested by gamekeepers, and destroyed on every opportunity.

LURGAN, a thriving t. of Ireland, in the county of Armagh, a station on the railway from Belfast to Armagh, 20 m. s.w. from the former town. It is unusually neat and clean in appearance, and carries on manufactures of damasks and diapers. Pop. '71, 10,632.

LURISTAN, a province of Persia, on the border of Khuzistan, between the Kerkhah and the Dizful, an affluent of the Karun; is almost entirely occupied by mountains and narrow valleys; 20,000 sq. miles. Near the outer ridges of the mountain region are some plains of moderate extent, which are under cultivation; the remainder of the region serves as pasture-ground for the different tribes of Lurs who inhabit it. The Bakhtiyari, one of these tribes, are ferocious and warlike. The only town is Khorrám-abad, situated in a fertile district, 90 m. s. of Hamadan, on a feeder of the Kerkhah; it contains about a thousand huts, built on the s.w. face of a steep rock, on whose summit are a fortress and a palace.

LURLEI, or LORELEI, the name of a steep rock on the right bank of the Rhine, about 430 ft. high, a little way above St. Goar, celebrated for its echo, which is said to repeat sounds fifteen times. Near it is a whirlpool, and still nearer, a rapid, called the *bank*, formed by the river rushing over a number of sunken rocks—visible, however, at low water. In consequence, the navigation of the Rhine by rafts and boats is rather dangerous at this point, which circumstance, in connection with the *echo*, has undoubtedly given rise to the legend of the beautiful but cruel siren who dwelt in a cave of the Lurlei, and allured the passing voyagers to approach by the magic melody of her song, until she wrecked and sank them in the whirlpool. The legend has been a great favorite with the German poets, but none has treated it so exquisitely as Heine.

LUSA'TIA (*Lausitz*), a region in Germany, now belonging in part to Saxony and in part to Prussia. It was formerly divided into upper and lower Lusatia, which constituted two independent margraviates, including an area of about 4,400 sq.m., and a population of about half a million, and bounded on the s. by Bohemia, on the w. by Misnia and the electorate of Saxony, on the n. by Brandenburg, and on the e. by Silesia. In 1319, Lusatia was given to Bohemia, but was obtained by Matthias Corvinus in 1478, and was finally transferred to Saxony in 1635; but, by the congress of Vienna, the whole of lower Lusatia and the half of upper Lusatia was ceded to Prussia. The portion left to Saxony now forms the circle of Bautzen.

LUSHINGTON, STEPHEN, D.C.L., 1782–1873; b. England; educated at Oxford, and called to the bar in 1806. The next year he was returned to parliament for Great Yarmouth, and represented that and other boroughs till 1841, when he was obliged to retire in consequence of an act of parliament disqualifying the judge of the admiralty from sitting in the commons. He was a follower of Fox and Grenville; and among the parliamentary measures which he supported, were the abolition of the slave-trade, the recognition of the South American republics, and the emancipation of the Jews. In 1820 he was of counsel for queen Caroline, in conjunction with lord Denham and lord Brougham. He was appointed a judge of the consistory court in 1828, and judge of the admiralty in 1838, and, in the latter year, he was sworn in of the privy council. He was the counsel and friend of lady Byron, and an authority on ecclesiastical law.

LUSITA'NIA, a district of ancient Hispania, which, as the country occupied by the Lusitani was, according to Strabo, bounded s. by the Tagus, n. and w. by the ocean. Its extent afterwards was contracted by the growing importance of the Callaici, and the river Durius (*Douro*) became its n. boundary. Afterwards, many of the Lusitanians being driven southward in their long struggles with the Romans, the name Lusitania was given to the district s. of the Tagus. When Augustus divided the peninsula into the three provinces, Bætica, Tarraconensis, and Lusitania, the last occupied the s.w., between the Anas (*Guadiana*) on the e., the sea on the s. and w., and Durius on the north. It comprised the greater part of the modern kingdom of Portugal, besides a large portion of Leon and the Spanish Estremadura. The chief river in the district is the Tagus, flowing w. into the Atlantic. Some of the principal towns are Metellinum (*Medellin*); Emerita Augusta (*Merida*), the Roman capital, on the Anas; Olisipo (*Lisbon*), the capital before the time of the Romans, on the Tagus; Conimbriga (*Coimbra*), on the Munda; Salmantica (*Salamanca*); Pax Julia (*Beja*); Ebora (*Evora*). The province was formerly rich and fertile, and had valuable mines of gold and silver. The Lusitani were a wild and warlike people, much addicted to plunder, especially those living in the mountains. They were the bravest of all the Iberians, and held out the longest in resistance to the Romans. In 153 B.C. they revolted, and for fourteen years fought against the Romans, who, for a time, acknowledged their independence. Viriathus, their chief, a bold and skillful leader, defeated several Roman generals. At length the consul Cæpio, unable to subdue him in the field, captured him by the treachery of some of his intimate friends, and put him to death, when the Lusitanians were completely subdued, 140 B.C.

LUSTER, a term used in mineralogy to denote degrees and qualities of brightness. There are six kinds usually recognized, viz.: metallic, vitreous, adamantine, resinous, pearly, and silky. There are usually four and sometimes five degrees recognized, viz.: splendent, when a perfect image is reflected; shining, glistening; some use the term glimmering when the reflection seems to be limited to points on the surface. Minerals also are said to have a dull luster.

LUSTRATION, in antiquity, purification by sacrifices and various ceremonies. The Greeks and Romans purified the people, cities, fields, armies, etc., defiled by crime or impurity. This was done in several ways, viz.: by fire, water, sulphur, and air, the last by fanning or agitating the air around the thing purified. When Servius Tullius had numbered the Roman people, he purified them as they were assembled in the Campus Martius; and afterwards a lustration of the whole people was performed every fifth year before the censors went out of office. On that occasion the people assembled in the Campus Martius, when the sacrifices termed *suovetaurilia*, consisting of a sow, sheep, and ox, after being carried thrice around the people, were offered up, and a great quantity of perfumes was burned. This ceremony was called *lustrum*. It was instituted by Servius Tullius, 566 B.C., and performed for the last time in the reign of Vespasian. The

term *lustrum* was given also to the period of five years between the lustra. The army was purified before a battle by causing the soldiers to defile before the two quivering halves of a victim, while the priest offered certain prayers. The establishment of a new colony was preceded by a lustration with sacrifices. Rome itself, and all towns within its dominion, always underwent a lustration after being visited by some great calamity. The lustrations of fields were performed after sowing was finished, and before reaping began. The lustration of flocks, designed to keep them from disease, was performed every year at the festival of the Palilia, when the shepherd sprinkled them with pure water, thrice surrounding the fold with savin, laurel, and brimstone set on fire, and afterwards offering incense and sacrifices to Pales, the tutelary goddess of shepherds. Private houses were purified with water, a fumigation of laurel, juniper, olive-tree, and the like, and a pig offered as the victim. Infants were purified, girls on the third, boys on the ninth, day after birth, then named and placed under the protection of the god of the family. The lustration of a funeral pile was by having the spectators march round it before a fire was kindled. Whatever was used at a lustration was cast into a river, or some other inaccessible place, as to tread upon it was considered ominous of some great disaster.

LUSTRUM (from *luere*, to purify or expiate), the solemn offering made for expiation and purification by one of the censors in name of the Roman people at the conclusion of the census (q.v.). The animals offered in sacrifice were a boar (*sus*), sheep (*ovis*), and bull (*taurus*), whence the offering was called *suovetaurilia*. They were led round the assembled people on the Campus Martius before being sacrificed. As the census was quinquennial, the word *lustrum* came to mean a period of five years.

LUTE (Ger. *Laut*, sound), an obsolete stringed musical instrument, which has been superseded by the harp and guitar. It consisted of a table of fir; a body or belly, composed of 9 (sometimes 10) convex ribs of fir or cedar; a neck, or finger-board, of hard wood, on which were 9 (or 10) frets, stops, or divisions, marked with catgut strings; a head, or cross, on which were placed the pegs or screws that tightened or relaxed the strings in tuning; and a bridge, to which the strings were attached at one end, the other end being fastened to a piece of ivory, between the head and neck. The number of strings, originally 6, of which five were doubled, so as to make 11, was gradually increased till they numbered 24. The performer used his left hand to press the stops, and struck the strings with his right. A peculiar description of notation, called *tablature*, was employed in music written for the lute. The strings were represented by parallel lines, on which were placed letters of the alphabet, referring to the frets: thus, A marked that the string was to be struck open (or without pressing any of the stops); B, that the first stop was to be pressed; C, the second, and so on: while over the letters were placed hooked marks, corresponding to the minim, crotchet, quaver, etc., to indicate time. So carelessly and inaccurately was lute-music generally written that it is no easy matter to render it into the ordinary notation. The lute was formerly in high favor all over Europe as a chamber-instrument; and it was used in dramatic music to accompany the recitative. In the time of Handel, there was a lute in the Italian opera in London; and there was a lutanist in the King's chapel down to the middle of last century. —For a minute account of the lute, and how to play it, see Mace's *Musick's Monument* (Lond. 1676).

LUTE (Lat. *lutum*, clay), in chemistry, denotes a substance employed for effectually closing the joints of apparatus, so as to prevent the escape of vapor or gases, or for coating glass vessels so as to render them more capable of sustaining a high temperature, or for repairing fractures. For ordinary purposes, lutes made of common plastic clay or pipe-clay with an admixture of linseed-meal or almond-powder, or, for common stills, linseed-meal and water made into a paste, are quite sufficient; for more delicate experiments, *fat lute* (q.v.), covered over with moistened bladder, is used. Lutes for coating glass vessels are generally composed of Stourbridge clay or Windsor loam, mixed with water; but the most simple method is to brush the glass retort over with a paste of pipe-clay and water, dry it quickly, and repeat the operation till a sufficient thickness of coating is obtained. Other lutes in frequent use are *Willis's lute* (a paste composed of a solution of borax in boiling water, with slaked lime), various mixtures of borax and clay, of lime and white of egg, *iron cement* (see CEMENTS), moistened bladder, paper prepared with wax and turpentine, and caoutchouc. The use of the last-named lute has, on account of its flexibility and consequent non-liability to accident, been rapidly extending.

LUTHER, MARTIN, the greatest of the Protestant reformers of the 16th c., was b. at Eisleben on Nov. 10, 1483. His father was a miner in humble circumstances; his mother, as Melanchthon records, was a woman of exemplary virtue (*exemplar virtutum*), and peculiarly esteemed in her walk of life. Shortly after Martin's birth, his parents removed to Mansfeld, where their circumstances ere long improved by industry and perseverance. Their son was sent to school; and both at home and in school, his training was of a severe and hardening character. His father sometimes whipped him, he says, "for a mere trifle till the blood came," and he was subjected to the scholastic rod fifteen times in one day! Scholastic and parental severity was the rule in these days; but

whatever may have been the character of Luther's schoolmaster at Mansfeld, there is no reason to believe that his father was a man of exceptionally stern character. While he whipped his son soundly, he also tenderly cared for him, and was in the habit of carrying him to and from school in his arms with gentle solicitude. Luther's schooling was completed at Magdeburg and Eisenach, and at the latter place he attracted the notice of a good lady of the name of Cotta, who provided him with a comfortable home during his stay there.

When he had reached his eighteenth year, he entered the university of Erfurt, with the view of qualifying himself for the legal profession. He went through the usual studies in the classics and the schoolmen, and took his degree of doctor of philosophy, or master of arts, in 1505, when he was 21 years of age. Previous to this, however, a profound change of feeling had begun in him. Chancing one day to examine the Vulgate in the university library, he saw with astonishment that there were more gospels and epistles than in the lectionaries. He was arrested by the contents of his newly found treasure. His heart was deeply touched, and he resolved to devote himself to a spiritual life. He separated himself from his friends and fellow-students, and withdrew into the Augustine convent at Erfurt.

Here he spent the next three years of his life—years of peculiar interest and significance; for it was during this time that he laid, in the study of the Bible and of Augustine, the foundation of those doctrinal convictions which were afterwards to rouse and strengthen him in his struggle against the papacy. He describes very vividly the spiritual crisis through which he passed, the burden of sin which so long lay upon him, "too heavy to be borne;" and the relief that he at length found in the clear apprehension of the doctrine of the "forgiveness of sins" through the grace of Christ.

In the year 1507 Luther was ordained a priest, and in the following year he removed to Wittenberg, destined to derive its chief celebrity from his name. He became a teacher in the new university, founded there by the elector Frederick of Saxony. At first, he lectured on dialectics and physics, but his heart was already given to theology, and in 1509 he became a bachelor of theology, and commenced lecturing on the holy Scriptures. His lectures made a great impression, and the novelty of his views already began to excite attention. "This monk," said the rector of the university, "will puzzle our doctors, and bring in a new doctrine." Besides lecturing, he began to preach, and his sermons reached a wider audience, and produced a still more powerful influence. His words, as Melanchthon said, were "born not on his lips, but in his soul," and they moved profoundly the souls of all who heard them.

In 1510 or 1511 he was sent on a mission to Rome, and he has described very vividly what he saw and heard there. His devout and unquestioning reverence, for he was yet, in his own subsequent view, "a most insane papist," appears in strange conflict with his awakened thoughtfulness and the moral indignation at the abuses of the papacy beginning to stir in him.

On Luther's return from Rome he was made a doctor of the holy Scriptures, and his career as a reformer may be said to have commenced. The system of indulgences had reached a scandalous height. The idea that it was in the power of the church to forgive sin had gradually grown into the notion, which was widely spread, that the pope could issue pardons of his own free will, which, being dispensed to the faithful, exonerated them from the consequences of their transgressions. The sale of these pardons had become an organized part of the papal system. Money was largely needed at Rome, to feed the extravagances of the papal court; and its numerous emissaries sought everywhere to raise funds by the sale of "indulgences," as they were called, for the sins of frail humanity: the principal of these was John Tetzel, a Dominican friar, who had established himself at Jüterboch, on the borders of Saxony. Luther's indignation at the shameless traffic which this man carried on, finally became irrepressible: "God willing," he exclaimed, "I will beat a hole in his drum." He drew out 95 theses on the doctrine of indulgences, which he nailed up on the gate of the church at Wittenberg, and which he offered to maintain in the university against all impugners. The general purport of these theses was to deny to the pope all right to forgive sins. "If the sinner was truly contrite, he received complete forgiveness. The pope's absolution had no value in and for itself."

This sudden and bold step of Luther was all that was necessary to awaken a widespread excitement. The news of it spread rapidly far and wide. It seemed "as if angels had carried it to the ears of all men." Tetzel was forced to retreat from the borders of Saxony to Frankfort-on-the-Oder, where he drew out and published a set of counter-theses, and publicly committed those of Luther to the flames. The students at Wittenberg retaliated by burning Tetzel's theses. The elector refused to interfere, and the excitement increased as new combatants—Hochstratten, Prierias, and Eck—entered the field. Eck was an able man, and an old friend of Luther's, and the argument between him and the reformer was especially vehement.

At first the pope, Leo X., took little heed of the disturbance; he is reported even to have said when he heard of it that "Friar Martin was a man of genius, and that he did not wish to have him molested." Some of the cardinals, however, saw the real character of the movement, which gradually assumed a seriousness evident even to the pope; and Luther received a summons to appear at Rome and answer for his theses. Once

again in Rome, it is unlikely he would ever have been allowed to return. His university and the elector interfered, and a legate was sent to Germany to hear and determine the case. Cardinal Cajetan was the legate, and he was but little fitted to deal with Luther. He would enter into no argument with him, but merely called upon him to retract. Luther refused, and fled from Augsburg, whither he had gone to meet the papal representative. The task of negotiation was then undertaken by Miltitz, a German and envoy of the pope to the Saxon court, and by his greater address a temporary peace was obtained. This did not last long. The reformer was too deeply moved to keep silent. "God hurries and drives me," he said; "I am not master of myself; I wish to be quiet, and am hurried into the midst of tumults." Dr. Eck and he held a memorable disputation at Leipsic, in which the subject of argument was no longer merely the question of indulgences, but the general power of the pope. The disputation, of course, came to no practical result; each controversialist claimed the victory, and Luther in the meantime made progress in freedom of opinion, and attacked the papal system as a whole more boldly. Erasmus and Hutten joined in the conflict, which waxed more loud and threatening.

In 1520 the reformer published his famous address to the "Christian nobles of Germany." This was followed in the same year by a treatise *On the Babylonish Captivity of the Church*. In these works, both of which circulated widely, and powerfully influenced many minds, Luther took firmer and broader ground: he attacked not only the abuses of the papacy and its pretensions to supremacy, but also the doctrinal system of the church of Rome. "These works," Ranke says, "contain the kernel of the whole reformation." The papal bull was issued against him; the dread document was burned before an assembled multitude of doctors, students, and citizens at the Elster Gate of Wittenberg. Germany was convulsed with excitement. Eck (who had been the chief agent in obtaining the bull) fled from place to place, glad to escape with his life, and Luther was everywhere the hero of the hour.

Charles V. had at this time succeeded to the empire, and he convened his first diet of the sovereigns and states at Worms. The diet met in the beginning of 1521; an order was issued for the destruction of Luther's books, and he himself was summoned to appear before the diet. This was, above all, what he desired—to confess the truth before the assembled powers of Germany. He resolved to obey the summons, come what would. All Germany was moved by his heroism; his journey resembled a triumph; the threats of enemies and the anxieties of friends alike failed to move him. "I am resolved to enter Worms," he said, "although as many devils should set at me as there are tiles on the house-tops." His appearance and demeanor before the diet, and the firmness with which he held his ground, and refused to retract, all make a striking picture. "Unless I be convinced," he said, "by Scripture and reason, I neither can nor dare retract anything, for my conscience is a captive to God's word, and it is neither safe nor right to go against conscience. There I take my stand. I can do no otherwise. So help me, God. Amen."

On his return from Worms he was seized, at the instigation of his friend, the elector of Saxony, and safely lodged in the old castle of the Wartburg. The affair was made to assume an aspect of violence, but in reality it was designed to secure him from the destruction which his conduct at Worms would certainly have provoked. He remained in this shelter for about a year, concealed in the guise of a knight. His chief employment was his translation of the Scriptures into his native language. He composed various treatises besides, and injured his health by sedentary habits and hard study. His imagination became morbidly excited, and he thought he saw and heard the evil one mocking him while engaged in his literary tasks. On one occasion he hurled his inkstand at the intruder, and made him retreat. The subject of the personality and presence of Satan was a familiar one with Luther, and he has many things about it in his *Table-talk*.

The disorders which sprang up in the progress of the reformation recalled Luther to Wittenberg. He felt that his presence was necessary to restrain Carlstadt and others, and, defying any dangers to which he might still be exposed, he returned to the old scene of his labors, rebuked the unruly spirits who had acquired power in his absence, and resumed with renewed energy his interrupted work. He strove to arrest the excesses of the Zwickau fanatics, and counseled peace and order to the inflamed peasants, while he warned the princes and nobles of the unchristian cruelty of many of their doings, which had driven the people to exasperation and frenzy. At no period of his life is he greater than now in the stand which he made against lawlessness on the one hand and tyranny on the other. He vindicated his claim to be a reformer in the highest sense by the wise and manly part which he acted in this great social crisis in the history of Germany.

His next act of importance was by no means so commendable. Although he had been at first united in a common cause with Erasmus, estrangement had gradually sprung up between the scholar of Rotterdam and the enthusiastic reformer of Wittenberg. This estrangement came to an open breach in the year 1525, when Erasmus published his treatise *De Libero Arbitrio*. Luther immediately followed with his counter-treatise, *De Servo Arbitrio*. The controversy raged loudly between them; and in the vehemence of his hostility to the doctrine of Erasmus, Luther was led into various asser-

tions of a very questionable kind, besides indulging in wild abuse of his opponent's character. The quarrel was an unhappy one on both sides; and it must be confessed there is especially a want of generosity in the manner in which Luther continued to cherish the dislike which sprung out of it.

In the course of the same year, Luther married Katharina von Bora, one of nine nuns, who, under the influence of his teaching, had emancipated themselves from their religious vows. The step rejoiced his enemies, and even alarmed some of his friends like Melanchthon. But it greatly contributed to his happiness, while it served to enrich and strengthen his character. All the most interesting and touching glimpses we get of him henceforth are in connection with his wife and children.

Two years after his marriage he fell into a dangerous sickness and depression of spirits, from which he was only aroused by the dangers besetting Christendom from the advance of the Turks. Two years later, in 1529, he engaged in his famous conference at Marburg with Zwingli and other Swiss divines. In this conference he obstinately maintained his peculiar views as to the sacrament of the Lord's-supper (q.v.; see also IMPANATION); and, as in the controversy with Erasmus, distinguished himself more by the inflexible dogmatism of his opinions than by the candor and comprehensiveness of his arguments, or the fairness and generosity of his temper. Aggressive and reforming in the first stage of his life, and while he was dealing with practical abuses, he was yet in many respects essentially conservative in his intellectual character, and he shut his mind pertinaciously after middle life to any advance in doctrinal opinion. The following year finds him at Coburg, while the diet sat at Augsburg. It was deemed prudent to intrust the interests of the Protestant cause to Melanchthon, who attended the diet, but Luther removed to Coburg, to be conveniently at hand for consultation. The establishment of the Protestant creed at Augsburg marks the culmination of the German reformation; and the life of Luther from henceforth possesses comparatively little interest. He survived 16 years longer, but they are years marked by few incidents of importance. He died in the end of Feb., 1546.

Luther's character presents an imposing combination of great qualities. Endowed with broad human sympathies, massive energy, manly and affectionate simplicity, and rich, if sometimes coarse humor, he is at the same time a spiritual genius. His intuitions of divine truth were bold, vivid, and penetrating, if not comprehensive; and he possessed the art which God alone gives to the finer and abler spirits that he calls to do special work in this world, of kindling other souls with the fire of his own convictions, and awakening them to a higher consciousness of religion and duty. He was a leader of men, therefore, and a reformer in the highest sense. His powers were fitted to his appointed task: it was a task of Titanic magnitude, and he was a Titan in intellectual robustness and moral strength and courage. It was only the divine energy which swayed him, and of which he recognized himself the organ, that could have accomplished what he did.

Reckoned as a mere theologian, there are others who take higher rank. There is a lack of patient thoughtfulness and philosophical temper in his doctrinal discussions; but the absence of these very qualities gave wings to his bold, if sometimes crude, conceptions, and enabled him to triumph in the struggle for life or death in which he was engaged. To initiate the religious movement which was destined to renew the face of Europe, and give a nobler and more enduring life to the Saxon nations, required a gigantic will, which, instead of being crushed by opposition or frightened by hatred, should only gather strength from the fierceness of the conflict before it. To clear the air thoroughly, as he himself said, thunder and lightning are necessary; and he was well content to represent these agencies in the great work of reformation in the 16th century. Upon the whole, it may be said that history presents few greater characters—few that excite at once more love and admiration, and in which we see tenderness, humor, and a certain picturesque grace and poetic sensibility more happily combine with a lofty and magnanimous, if sometimes rugged sublimity.

Luther's works are very voluminous, partly in Latin, and partly in German. Among those of more general interest are his *Table-talk*, his *Letters*, and *Sermons*. De Wette has given to the public a copious and valuable edition of his *Letters*, which, along with his *Table-talk*, are the chief authority for his life. Many special lives of him, however, have been written, by Melanchthon, Michelet, Audin, and others.

LUTHERAN CHURCH in the United States (LUTHERANS, *ante*). The first Lutherans came to America in 1621 in company with the first Dutch emigrants to what is now New York. They were without ministerial guidance. In 1638 Swedish Lutherans, with a minister, settled at Wilmington, Del. Their second pastor translated Luther's smaller catechism into the language of the native tribes in the vicinity, commencing missionary labor among them soon after 1643, about the same time with John Eliot in Massachusetts. These Swedes afterwards united with the Protestant Episcopal church, under whose care the "old Swedes' church" in Wilmington still stands. There is a similar one in Philadelphia, popularly known by the same name, and in communion with the same denomination. The first German Lutheran settlers in this country also came to New York with the Dutch in 1644, and were at first without a minister. When numerous enough to support a pastor, the Dutch would not allow them to have one.

But under the English rule, having obtained religious liberty, they secured their first minister, Jacob Fabricius, in 1664, and a house of worship in 1671. This was rebuilt, in 1703, at Broadway and Rector street. In 1710, 4,000 Germans, fleeing from civil and religious oppression, settled in New York, Pennsylvania, and South Carolina. Another colony went to Georgia in 1734, and was much increased by a second company the following year. John and Charles Wesley, when they visited Georgia, found these Lutherans flourishing and useful. The German Lutherans of Philadelphia, having sent earnest requests for help to their brethren in England and the fatherland, Franke, the founder of the orphan house at Halle, persuaded Dr. Henry Melchior Muhlenberg to settle in America. His arrival in 1742 opened a new era in the progress of the American Lutheran church, of which, indeed, he was, in a great degree, the founder. When he came, finding no organization, he set himself to effect a union at least of German Lutherans. By exerting his influence in Germany, he induced a number of his friends to come to America, so that in 1748 he was able to form a synod, which afterwards met annually with very beneficial results. In 1749 an orphan asylum was established at Ebenezer, Ga.; in 1765 a private theological seminary was commenced; in 1787 the legislature of Pennsylvania founded Franklin college "for the special benefit of the Germans of the commonwealth, as an acknowledgment of services rendered by them to the state, and in consideration of their industry and public virtues;" and in 1791 the same legislature gave 5,000 acres of land to the free schools of the Lutheran church in Philadelphia. In 1785 the New York synod was formed; in 1803, that of North Carolina; in 1819, that of Ohio; and in 1820, that of Maryland and Virginia. In 1816 a public theological seminary was established at Hartwick, N. Y. During the revolution the Lutherans were zealous patriots, and, in consequence, incurred the dislike of the English. At the close of the war a large number of the German soldiers whom the British government had hired remained in this country and joined the Lutheran congregations. The growing acquaintance of the younger generations with the English language made them anxious to have part, at least, of the religious services conducted in it. The older persons, however, resisted the effort, some of them even believing that the German might become the language of the country. The first Lutheran church in which English was exclusively used was built in 1809, and it remained the only one for many years. In 1820 the general synod was formed, representing 135 ministers and 33,000 church members. The fresh arrival of Lutherans from Europe produced differences of opinion and disputes which resulted in several secessions from the main body. After the war of the rebellion the southern general synod was formed. A division on doctrinal grounds next occurred in the northern synods. While the Augsburg confession was cordially accepted by the general synod as a most important historical document, they did not regard a strict adherence to the letter of its teachings as essential to church membership, the privileges of which they wished to extend to all Lutherans. But the stricter party were dissatisfied with this liberal view, and, in 1864, the admission of the Frankean synod led to the withdrawal of the oldest organization—the synod of Pennsylvania—and, subsequently, to the formation of the general council.

STATISTICS AS GIVEN IN THE CHURCH ALMANAC FOR 1880:

	Ministers.	Congregations.	Members.
I. Synodical conference	1,150	1,875	436,000
II. General synod, north	840	1,217	125,000
III. General council	760	1,467	207,200
IV. General synod, south	100	175	13,300
V. Independent synods	165	490	43,500
Total, 58 synods	3,015	5,224	825,000

LUTHERANS, a designation originally applied by their adversaries to the reformers of the 16th c., and which afterwards was distinctively appropriated among Protestants themselves to those who took part with Martin Luther against the Swiss reformers, particularly in the controversies regarding the Lord's-supper. It is so employed to this day, as the designation of one of the two great sections into which the Protestant church was soon unhappily divided, the other being known as the *Reformed* (q.v.). To the end of Luther's life, perfect harmony subsisted between him and his friend Melanchthon; but already there were some who stood forth as more Lutheran than Luther, and by whom Melanchthon was denounced as a *Crypto-Calvinist* and a traitor to evangelical truth. After Luther's death, this party became more confident; and, holding by Luther's words, without having imbibed his spirit, changed his evangelical doctrine into a dry scholasticism and lifeless orthodoxy, while extreme heat and violence against their opponents were substituted in the pulpit itself for the zealous preaching of the gospel. The principal seat of their strength was in the university of Jena, which was founded in 1557 for this very object, and maintained their cause against Wittenberg. The utmost illiberality characterized this party; and in so far as governments came under their influence, extreme intolerance was manifested, the measures adopted against those who

differed from them being not unfrequently of a persecuting nature. No controversy was ever conducted with more bitterness than the *sacramentarian controversy* (q.v.).

Towards the end of the 17th c. the Lutherans of Germany found a new object of hostility in the *Pietists* (q.v.), against whom they stired up the passions of the multitude, and instigated the governments to severity.—In the 18th c. they came into conflict with *Rationalism* (q.v.), which may be regarded as a consequence of the state of things existing in Germany during the previous period of unprofitable theological strife.—When, after the wars of the French revolution were over, the Prussian government formed and carried into execution a scheme for the union of the Lutheran and Reformed churches into one national church (see PRUSSIA), an active opposition arose on the part of those who now began to be known as *old Lutherans*. Separate congregations were formed, and an attitude of open hostility to the government was assumed by some; while others, more moderate, but holding the same theological opinions, continued to maintain these opinions within the *United Evangelical church*. Among the latter were some of the most eminent divines in Germany, as Hengstenberg, Olshausen, Guericke, and Tholuck. The separatists were for some time severely dealt with by the government, and, consequently, many left their native country to found old Lutheran communities in America and Australia. This took place chiefly about the year 1837. After that time greater toleration was practiced, and now the old Lutherans form a legally recognized ecclesiastical body in Prussia. For some time after the political excitement of 1848, those who held the Lutheran doctrines within the national or United Evangelical church of Prussia, exhibited considerable uneasiness and a strong desire for a position more consistent with their ecclesiastical traditions; but more recently this feeling seems to have been considerably allayed.

Lutheranism is the prevailing form of Protestantism in Saxony, Hanover, and the greater part of northern Germany, as well as in Würtemberg; it also prevails to a considerable extent in other parts of Germany. It is the national religion of Denmark, Sweden, and Norway; and there are Lutheran churches in Holland, France, Poland, etc. Among the Lutheran symbolical books, the *Augsburg Confession* (q.v.) holds the principal place; but the supreme authority of the holy Scriptures is fully recognized. The chief difference between the Lutherans and the Reformed is as to the *real presence* of Christ in the sacrament of the supper; the Lutherans holding the doctrine of *consubstantiation*, although rejecting *transubstantiation* (see LORD'S-SUPPER; IMPANATION; and TRANSUBSTANTIATION); while some of their more extreme theologians have asserted not only the presence of the human nature of Christ in the Lord's-supper, as Luther did, but the absolute omnipresence of his human nature. Other points of difference relate to the allowance in Christian worship of things *indifferent* (*adiaphora*); and many of those things at first retained as merely tolerable by Luther and his fellow-reformers, have become favorite and distinguishing characteristics of some of the Lutheran churches—as images and pictures in places of worship, clerical vestments, the form of exorcism in baptism, etc. Among the old Lutherans of Prussia, particularly the separatists, a strong tendency to exaggeration in these distinctive peculiarities has manifested itself.

In many of the Lutheran churches, the doctrines of Luther, and of their symbolical books, have long given place, in a great measure, to Arminianism, and to a system of religion very inconsistent with Luther's doctrine of justification by faith. In some quarters, particularly in Norway and Sweden, a reaction has of late years appeared; and many of the Lutheran divines of Germany are strenuous supporters of the "evangelical" doctrines of the reformers.

In its constitution the Lutheran church is generally *unepiscopal*, without being properly *presbyterian*. In Denmark and Sweden there are bishops, and in Sweden an archbishop (of Upsal), but their powers are very limited. Where Lutheranism is the national religion, the sovereign is recognized as the supreme bishop, and the church is governed by consistories appointed by him, and composed both of clergymen and laymen. The members of congregations possess almost no rights.

LÜT'KE, FEODOR PETROVITCH, b.–1797; was educated for the Russian naval service. In 1817–19 an associate in a Russian expedition around the world, which made discoveries on the shores of Nova Zembla. From 1826 to 1828 he was engaged in explorations in Behring's straits, the sea of Kamtchatka, its connections, and its before unknown islands. In 1830 he made a voyage of scientific observation to ascertain the oscillations of the pendulum. He was made admiral in 1835, and was subsequently employed in conspicuous service. In 1855 he procured the establishment of the Russian geographical society, and in 1864 was president of the academy of sciences at St. Petersburg. His principal published work is his *Four Voyages Across the Arctic Seas* (St. Petersburg, 1824).

LU'TON, a market t. and parish of England, co. Bedford, situated 30 m. n.n.w. of London, on the river Lea, which rises in the parish. It is connected with the London and Northwestern and the Great Northern railways by branch-lines from Leighton Buzzard to Hatfield. Staple trade, straw-hat manufacture. Pop. '71, 17,317. The parish church, an ancient and noble structure, contains an elegant and perhaps unique baptismal font.

LUTRA. See OTTER, *ante*.

LUTTI, FRANCESCA, b. Riva di Trento, in the Italian Tyrol; is devoted to literature and philanthropy, and ranked among the first of Italian poets. Her works are *Novelle e Liriche* (2 vols.); *Alberto;* and *Un Proverbio.*

LÜTTRINGHAUSEN, a prosperous manufacturing t. of Rhenish Prussia, 18 m. s.e. from Düsseldorf. Woolen, linen, and cotton manufactures are carried on; also manufactures of hardware and cutlery. Pop. '75, 9,493.

LUTZ, JOHANN VON, 1826; b. Bavaria; Bavarian minister of justice, 1867–69, when he took the office of minister of public education and worship, in which he distinguished himself by his firm resistance to the ultramontanes.

LÜTZEN, a small t. of (1871) 2,647 inhabitants, in the Prussian province of Saxony, famous for two great battles fought in its vicinity. The first took place on $\frac{6}{16}$th Nov., 1632. Gustavus Adolphus, who had moved in the direction of Bavaria, being recalled from his designs of conquest there by the advance of Wallenstein on Saxony, united his forces with those of duke Bernard of Saxe-Weimar, and attacked the imperialists at Lützen. The fortune of the day was very various; but notwithstanding the death of Gustavus Adolphus, victory remained with the Swedes, and Wallenstein was compelled to resign to them the field of battle. About 9,000 men were killed and severely wounded.

The *battle of Lützen*, on May 2, 1813, was fought somewhat further to the s., at the village of Groszgörschen. It was the first great conflict of the united Russian and Prussian army with the army of Napoleon in that decisive campaign. The allies gained at first great successes, but the French were left in possession of the field at the close of the day; their superiority in numbers securing them the victory, although they lost about 12,000 men, and the allies only 10,000. By this battle, the French regained possession of Saxony and the Elbe.

LÜTZOW, LUDWIG ADOLF WILHELM, Baron von, 1782–1834; a German officer of the province of Brandenburg, made famous principally by the songs of Körner, especially *Lutzow's Wilde, Verwegene Jagd.* On the retreat of the French from Moscow he placed himself at the head of the students of the universities, who rose *en masse* under the title of the *Tugenbund*, and, as the black cavalry, first distinguished themselves at the battle of Lützen. It was their vigorous following of the retreating French army that received the name of "Lutzow's wild chase."

LUXEMBOURG, FRANÇOIS HENRI DE MONTMORENCY, Duke of, marshal of France, a famous gen. of Louis XIV., b. at Paris, Jan. 8, 1628; was the posthumous son of François de Montmorency, count of Bouteville, who was beheaded on account of a duel. His aunt, the mother of the great Condé, brought him up as a companion of her son, with whom he took part in the disturbances of the Fronde, signalizing himself in the battles then fought. Being afterwards received into favor by Louis XIV., he served as a volunteer under Turenne in Flanders (1667), in Franche Comté as the lieut.-gen. of Condé, and in the Netherlands, where the battles of Grool, Deventer, Zwoll, etc., greatly increased his reputation. He had, however, the misfortune to embroil himself in a quarrel with the all-powerful Louvois, the results of which were disastrous to his prospects for a time. He assumed the title of Luxembourg on marrying the heiress of that house. Some of his military exploits were very daring, and were executed with great skill; his retreat from Holland, in particular, being executed in such a masterly manner that it placed him among the foremost generals of his age: but he largely participated in the savage burning of towns, and desolating of conquered districts, which disgraced the French arms at that period, though it is believed that in this he only carried out the positive instructions which he received from Louvois (q.v.). In the campaign of 1677 he defeated the prince of Orange at Mont-Cassel, took St. Omer, and compelled the prince to raise the siege of Charleroi. After the peace of Nimeguen, Louvois attempted to accomplish his destruction by means almost incredible. Having got possession of a contract between Luxembourg and a wood-merchant, he caused it to be changed so that it became a contract with the devil. Upon this, Luxembourg was summoned before the *chambre ardente*, and obeyed the citation, although his friends advised him to leave the country. He was thrown into the Bastile, and there confined in a dark dungeon. After fourteen months, he was acquitted and released, but banished to one of his domains, where he lived forgotten for ten years, at the end of which time, the king appointed him to the command of the army in Flanders. On July 1, 1690, he gained a victory over the prince of Waldeck at Fleurus; on Aug. 4, 1692, and July 29, 1693, over William III. of England, at Steenkirk and at Neerwinden. He took Charleroi, Oct. 12, 1693. He died Jan. 4, 1695. Luxembourg was crooked in shape and feeble in body, but possessed an inexhaustible activity of spirit.

LUXEMBOURG PALACE, built at Paris in 1615 by order of Marie de' Médicis. It is in the style of the Pitti palace at Florence, and was sumptuously decorated by Debrosse, but afterwards altered by Chalgrin, the architect of the Arc de l'Étoile. Between 1621 and 1625 Rubens, who was commissioned to embellish the palace with paintings, painted, with the assistance of his pupils, those large pictures representing scenes from the queen's life which are now in the Louvre. The long gallery in which these paintings were originally hung still contains frescos by Jordaens,

the pupil of Rubens. The palace continued to be a royal residence down to the revolution, shortly before which it was presented by Louis XVI. to his brother, the count of Provence, afterwards Louis XVIII. The palace derives its name from the duke of Pliney-Luxembourg, whose mansion formerly occupied the site, and, although various other names have been proposed, none of them has ever been permanently adopted. In 1795 the building was named the Palais du Directoire, and afterwards the Palais du Consulat. During the first empire the palace was occupied by the senate, and styled Palais du Sénat-Conservateur. After the restoration and under Louis Philippe, the chamber of peers met here. In March and April, 1848, the *commission des travailleurs*, under Louis Blanc, held its socialist meetings in the palace. From 1852 to 1870 it was named Palais du Sénat, that body having again sat here during the second empire. Since 1871 it has been occupied by the offices of the préfet de la Seine. The Palais du Luxembourg, although its architecture is somewhat heavy, is one of the handsomest and most symmetrical buildings of Paris. The principal façade, which has been restored in conformity with the design of Debrosse, rises opposite the rue de Tournon. It is nearly 300 ft. in width, and consists of a central dome-covered pavilion and two wings, connected by galleries. It is adorned with Tuscan, Doric, and composite columns placed above each other. The *salle du trône* was adorned in 1856 with a series of large pictures representing scenes from the history of the Napoleons. The room adjoining is a gallery of busts of former peers and senators. The apartments of queen Marie de' Médicis were restored in 1817. The chapel was restored and richly decorated in 1842. The dome of the library is adorned with one of the finest works of Eugène Delacroix, representing Elysium as portrayed by Dante. The *musée du Luxembourg* occupies a room on the ground-floor of the palace. It contains a collection of works of living artists, consisting of paintings, sculptures, drawings, engravings, and lithographs. The works of the most distinguished masters are generally transferred to the Louvre about ten years after their death. To the n.e. of the palace, opposite the gate of the garden, rises the *théâtre de l'Odéon*, a heavy and unattractive edifice erected in 1818. The façade on the n. side is adorned with a Doric portico. On the three other sides are galleries occupied by book and newspaper stalls. The interior is well fitted up, and the chandelier is particularly handsome. The *foyer* is embellished with busts and portraits of dramatists and actors connected with the Odéon. The garden of the Luxembourg on the e. and s. sides of the palace contains the "fontaine de, Médicis," by Debrosse, in the Doric style, with imitations of stalactites; "Polyphemus surprising Acis and Galatea," by Ottin; an "Archidamas about to Throw the Disk," by Lemaire; and copies of the "Borghese Gladiator" and the "Diana" of Versailles. The terraces surrounding the parterre are embellished with 20 modern statues in marble of celebrated French women. A fountain designed by Carpeaux was erected in 1875 at the point where the garden formerly terminated. It is adorned with eight horses rising above the lower basin, and with a group of four figures bearing an armillary sphere. The place is called the *carrefour de l'observatoire*. The statue of Ney, to the left of the *carrefour*, stands on the spot where the marshal was shot in 1815, in execution of the sentence pronounced by the chamber of peers on the previous evening. The statue is in bronze by Rude, and was erected in 1853. On the sides of the pedestal are inscribed the names of the battles at which the marshal was present. The *observatoire* is situated at the end of the avenue of that name. This celebrated institution was founded in 1672. The meridian of Paris runs through the center of the building, and the latitude of the s. façade is held to be that of Paris. The copper dome, which is 42 ft. in diameter, is constructed so as to revolve round its vertical axis for the purpose of adjusting the great equatorial which it contains. The observatory also has a new telescope, which cost 200,000 francs.

LUX'EMBURG, an old German co., and afterwards a duchy, which, about the 12th c., came into possession of the counts of Limburg, who assumed the title of counts of Luxemburg. It was next acquired by Burgundy, and in this way came into the hands of Austria. By the peace of Campo Formio (q.v.), it was ceded to France in 1797. In 1814 it was elevated to the rank of a grand duchy of the German confederation, and given to Holland in compensation for the loss of Nassau. In 1830, when Belgium formed itself into an independent kingdom, Luxemburg was divided between it and Holland—the latter, however, retaining little more than the fortress of Luxemburg, till 1839, when, by a treaty signed in London, a new division was made more favorable to Holland.—BELGIAN LUXEMBURG, or LUXEMBOURG, the largest province of Belgium, forming the s.e. corner of the country, contains an area of 1690 English sq.m., with a pop. (1873) of 206,069. It is traversed from s.w. to n.e. by a branch of the Ardennes, which nowhere exceed 2,000 ft. in height. The surface is in general extremely rugged, much covered with woods and morasses. The soil is poor. About a third of the arable land is devoted to pasture, great numbers of cattle, sheep and horses being reared for export. The horses are a strong, hardy breed, much prized both for agricultural and military purposes. The mineral wealth of the country consists of iron, lead, copper, marble, freestone, slate, gypsum, etc. The chief manufactures are cloth, tulle, earthenware, leather, nails, and potash; and the principal articles of export are hemp, flax, oak-bark, timber, iron, leather, cheese, etc. The cap-

ital of the province, Arlon, has a pop. of 4,200.—DUTCH LUXEMBURG, e. of the Belgian province of Luxemburg, is connected with the Netherlands in the person of the sovereign, but has a constitution and administration of its own. The king of Holland, as grand duke, appoints a deputy-governor. Dutch Luxemburg was a part of the Germanic confederation from its formation in 1815 till its dissolution in 1866. In 1867 its neutrality was guaranteed by the great powers. Its present constitution dates from 1868. The chamber of deputies consists of 40 members, chosen for 6 years by direct vote in the electoral districts. Area, 990 English sq.m.; pop. '71, 197,528, the most of whom are engaged in agriculture. The chief products are wine, corn, hops, hemp, and flax. In the eastern districts there are iron mines, and lime and slate quarries. The majority of the inhabitants are Walloons, the rest mainly Germans. The capital is Luxemburg. By a law of 1868 the army consists of 13 officers, 500 under-officers and privates, besides 122 gendarmes.

LUXEMBURG, the capital of Dutch Luxemburg, is situated on the Else or Alsette, 76 m. s. by e. from Liege, and possessed a pop., in '71, of 14,440. Its situation has often been compared to that of Jerusalem, being, like the latter, surrounded by escarped rocks, which, excepting the w. side, average 200 ft. in height. The Spaniards, Austrians, French, and Dutch, who successively held possession of the town, so increased and strengthened its fortifications that in the beginning of the 19th c. it was considered to be, with the exception of Gibraltar, the strongest fortress in Europe. Another portion of Luxemburg, called the "low town," is situated at the foot of the precipice, along the banks of the river. It possesses a fine cathedral, various handsome buildings, and public institutions. It has also manufactures of wax, distilleries, breweries, tanneries, and an extensive general trade. It was formerly garrisoned by Prussian troops; but by the treaty of London of 1867, these were withdrawn, and the fortifications demolished.

LUXOR, in upper Egypt. See THEBES, *ante*.

LUYNES, HONORÉ THÉODORIC PAUL JOSEPH D'ALBERT, Duc de, 1802–67; son of Mme. de Chevreuse, whose too plainly expressed contempt for some of the faults of the court of Napoleon I. caused her dismissal on two different occasions. Her son first turned to archæological studies by the discovery of the remains of the Greek city of Metapontum on one of his father's estates in Italy. On the accession of Louis Philippe in 1848 he became a member of the constituent assembly, and in 1849 of the legislative assembly. In 1851 he was one of the parties arrested by Louis Napoleon in the *coup d'état*, though not a republican. In 1864 he pursued archæological studies in Syria and Palestine, which were the basis for the work of his grandson, entitled *Voyage d'Exploration à la Mer Morte, à Palmyre, à Petra, et sur la rive gauche du Jourdan.*

LUZAC, JEAN, 1746–1807; a Dutch philologist, and one of the editors of the *Leyden Gazette*, a journal of large influence controlled by his family since 1738. He was a friend and correspondent of Washington, John Adams, and Jefferson, and for a time directed the education of John Quincy Adams. He was Greek professor of the university of Leyden at the close of the last century. His lectures on Greek history were considered too republican, and caused him to be suspended from his position for a time. In 1809 his lecture in defense of Socrates—*Lectiones Attica*—was published in Leyden.

LUZENBERG, CHARLES ALOYSIUS, 1805–48; b. Verona, Italy; entered college by special permission when but 10 years of age; emigrated to the United States in 1819; attended lectures in the Jefferson medical college in Philadelphia; in 1829 removed to New Orleans, where he was attached for a time to the charity hospital, and afterwards established one of his own, in which he performed many difficult surgical operations. He was in Europe 1832–34, and was elected a corresponding member of the Paris academy. He returned to Louisiana in 1834; founded the society of natural history in 1839, and the Louisiana medico-chirurgical society in 1843, and was the first president of both. Died in Cincinnati.

LUZERN. See LUCERNE, *ante*.

LUZERNE, a n.e. co. of Pennsylvania, drained by the Lehigh river and Nescopeck creek, and intersected by a branch of the Susquehanna; traversed by the Lehigh Valley, Central of New Jersey, and Lackawanna and Bloomsburg railroads; 850 sq.m.; pop. '80, 133,036. It is heavily wooded, and the scenery is varied and picturesque, comprising, among other features, the charming Wyoming valley. The soil is fertile, the productions including hay, Indian corn, lumber, oats, wheat, butter, and cattle. This county has a larger coal product than any other in the United States, the larger part of the mineral (anthracite) lying in the Wyoming and Lackawanna valleys. In 1870 the coal exportation of the county was nearly 10,000,000 tons. Co. seat, Wilkesbarre.

LUZERNE, CHEVALIER ANNE-CÉSAR DE LA, LL.D., 1741–91; a French gen., and ambassador to the United States from 1779 to 1783. His services to the United States won the gratitude of the nation during its struggle for independence. Luzerne co., in Pennsylvania, was named in his honor. In 1780 he lent his own private credit to obtain a loan for the relief of the American army, and congress voted him the thanks of the nation, which was reiterated by request of gen. Washington in 1789. He died while ambassador at London.

LUZON, the largest of the Philippine islands (q.v.).

LU'ZULA, a genus of plants of the natural order *juncæ*, differing from rushes in having a 3-seeded instead of a many-seeded capsule, and in having soft plane leaves, which are generally covered with thinly scattered longish hairs. They do not grow in wet places, like rushes, but in woods, pastures, and elevated mountainous situations. The English name, WOOD-RUSH, has sometimes been given to the whole genus, but is only appropriate to some, of which it is the popular name, as *L. sylvatica* and *L. pilosa*, common British species. Perhaps there is no more common British plant than the FIELD-RUSH (*L. campestris*), a plant of very humble growth; the flowering spikes of which, congregated into a close head, their dark color relieved by the whitish yellow of the anthers, profusely adorn dry pastures in spring. It is of little agricultural value. The species which grow under the shade of trees are valuable, as preserving their verdure in winter, adding to the beauty of the scene, and improving the cover for game.

LUZZATTO, MOSE CHAYIM, 1707–47; b. Italy; a Jewish mystic, who devoted himself to the study of Hebrew literature, especially the cabalistic writings. Having declared himself the Messiah, he was excommunicated, and took refuge in Holland, but afterwards removed to Palestine, where he died. He published a second book of the *Zohar*.

LUZZATTO, SAMUEL DAVID, 1800–65; b. Italy; a distinguished Jewish scholar, and professor of biblical exegesis in the rabbinical school at Padua from its foundation in 1829 till his death. He published *Dialogues on the Cabala, the Zohar*, etc.; a *Hebrew Grammar; Hebrew Notes on the Pentateuch; French Notes on Isaiah;* an Italian translation of Job; and of Isaiah, with a commentary in Hebrew.

LYCANTHRO'PIA (Gr. *lycos*, a wolf; *anthropos*, a man), wolf-madness. There has been, in various countries and times, a popular superstition and dread that men had been transmuted into wolves by Satanic agency, and roamed through forests and desert places actuated by the same appetites as the wild beast whose aspect or name they bore. The panic thus inspired may have suggested the delusion now under consideration, where the process of transformation was purely subjective, and the transforming power disease. Many instances occur, and may be encountered in every asylum, in which the insane conceive themselves dogs (*cynanthropia*) and other animals, and even inanimate objects; but these are solitary cases, whereas this hallucination has appeared epidemically, and lycanthropes have literally herded and hunted together in packs. In 1600 multitudes were attacked with the disease in the Jura, emulated the destructive habits of the wolf, murdered and devoured children; howled, walked, or attempted progression upon all-fours, so that the palms of the hands became hard and horny; and admitted that they congregated in the mountains for a sort of cannibal or devil's sabbath. Imprisonment, burning, scarcely sufficed to check what grew into a source of public danger. Six hundred persons were executed on their own confession. Cases in which the sufferer boasts of being a wolf, creeps like a quadruped, barks, leaps, bites, and which in other respects are closely allied to these, still happen in sufficient frequency to suggest the lesson that we are chiefly protected from the prevalence of such a moral pestilence by education, the greater diffusion of knowledge and sound principle, and by attention to the laws of health.—Calmiel, *De la Folie;* Arnold, *On Insanity*.

LYCAON, legendary king of Arcadia, son of Pelasgus and Melibæa, or Cyllene. He had many sons, some say fifty, others only twenty-two. According to the tradition of the Arcadians, he first introduced the worship of Zeus as the supreme being, founding Lycosena on the top of Mt. Lycæus. It is said that he offered human beings on the altars of Zeus. Jupiter, hearing of the impiety of Lycaon and his sons, came down to examine the truth of the report. They placed before him part of the body of a child dressed for dinner, when Zeus in horror and indignation struck with lightning the father and sons, except Nyctimus. Another account is that for their impiety they were changed into wolves. Some say that the flood of Deucalion, which occurred soon after, was in consequence of the crimes of Lycaon's sons.

LYCAON, a genus of *canidæ*, in dentition and general osteological structure nearly agreeing with dogs, but resembling hyenas in the form of the head and in having only four toes on each foot. The best ascertained species, *L. venaticus*, the WILD DOG, HYENA DOG, or HUNTING DOG of the cape of Good Hope, is rather smaller than a mastiff, and has a tall gaunt form. It is gregarious, and still infests even the neighborhood of Cape Town, committing great depredations on flocks of sheep. It is found over great part of Africa, from the cape of Good Hope to the valley of the Nile.

LYCAO'NIA, in ancient geography, a country in Asia Minor, bounded on the e. by Cappadocia, on the n. by Galatia, on the w. by Pisidia, and on the s. by Isauria and Cilicia. Its capital was Iconium (q.v.).

LYCE'UM, (Gr. *Lukeion*), originally the name of a place in the immediate neighborhood of Athens, consecrated to *Apollo Lyceius*, and noted for its shady wood and beautiful gardens, but particularly for its gymnasium, in which Aristotle and the Peripatetics taught, and from which the Romans borrowed the same name for similar institutions. In more modern times, the name lyceum was given in honor of Aristotle to the higher Latin schools in which the Aristotelian philosophy formed a principal branch of education; and at the present day, the name is variously applied to educational and literary institutions.

LYCH-GATE (Ang.-Sax. *lic* or *lice*, a body, corpse), or CORPSE-GATE, a churchyard gate covered with a roof. It is very common in many parts of England. The bodies of persons brought for burial are set down under the shelter of the roof while the service is read. Lych-gates are very rare in Scotland. There is one at Peebles.

LYCH'NIS, a genus of plants of the natural order *caryophyllaceæ;* having a tubular 5-toothed calyx; corolla twice as long as the calyx, with a spreading wheel-shaped limb, crowned at the mouth of the tube, and generally divided at the border; ten stamens, and five styles. The species are herbaceous plants, generally perennial, natives of temperate countries. Several are found in Britain. The RAGGED ROBIN (*L. flos-cuculi*) is one of the most frequent ornaments of meadows and moist pastures; the GERMAN CATCHFLY (*L. viscaria*), very rare, and generally found growing on almost inaccessible precipices; the RED CAMPION (*L. diurna*), and the WHITE CAMPION (*L. vespertina*), abound in fields, hedges, and the borders of woods. The last two are dicœcious, and, strangely enough, the female of the first and the male of the second are very common, while the male of the first and female of the second are rather rare. The flowers of *L. vespertina* are usually fragrant in the evening. The SCARLET LYCHNIS (*L. Chalcedonica*), a native of Asia Minor, is a frequent and brilliant ornament of flower-borders. Some of the species have saponaceous properties.

LY'CIA, a country on the s. coast of Asia Minor, extending towards Mt. Taurus, and bounded on the w. by Caria, and on the n. by Phrygia and Pisidia, and on the e. by Pamphylia. The most ancient inhabitants are said to have been two Semitic races called the *Solymi* and *Termilæ*, the former of whom were driven from the coast to the mountains in the n. by adventurers from Crete, under the command of Sarpedon, a brother of Minos, who first gave the country the name of Lycia. To what race the invaders belonged, is not certain; they were, however, not of Hellenic origin. The Lycians are prominent in the Homeric legend of the Trojan war. It shared the vicissitudes of the other states of Asia Minor, becoming subject to the Persian and Syrian monarchies, and then to Rome. During the time of its independence, it consisted of 23 confederate cities, of which the principal were Xanthus, Patara, Pinara, Olympus, Myra, and Tlos; and at the head of the whole confederation was a president or governor called the Lyciarch. Many monuments and ruined buildings (temples, tombs, theaters, etc.), exquisite sculptures, coins, and other antiquities, testify to the attainments of the Lycians in civilization and the arts, in which they rival the Greeks themselves. These antiquities, however, had received little attention, till sir Charles Fellows, about the year 1840, pointed out their interesting character. Since that time they have been very assiduously explored and studied. A beautiful collection of Lycian sculptures, made by sir Charles, is now to be seen in the British museum. The most interesting of all the antiquities of Lycia are, however, the inscriptions in which a peculiar alphabet is used, nearly allied to the Phrygian, and the language of which appears to be an Indo-Germanic language, mingled with Semitic words. Grotefend, Sharpe, Daniell, and others have spent much labor in deciphering these inscriptions.

LYCOMING, a co. in n. Pennsylvania, intersected centrally by Lycoming creek, watered also by Loyalsock creek in the s. and Pine creek with its branches in the w., all affluents of the w. branch of the Susquehanna river; 1250 sq.m.; pop. '80, 57,482—52,725 of American birth, 970 colored. Its surface is mountainous, particularly in the s. and w. sections, where it rises into a range of the Alleghany mountains, presenting very attractive scenery. Its surface is largely covered with forests of hard wood, and timber is one of its chief commodities. Its soil in the valleys is fertile, and produces every variety of grain, tobacco, wool, dairy products, honey, and maple sugar. Cash value of farms in '70, $11,212,366, numbering 2,640. Value of live stock in '70, $1,244,900. It had in '70, 608 manufacturing establishments, with a capital of $7,875,938, and an annual product of $9,081,406. Among its mineral products are black marble, limestone, iron, and coal. It had in '70, one coal mine, employing 30 hands, with a capital of $185,000, and an annual product of $4,000. Its manufactures are represented by machine shops, lumber, flour, and paper mills, plow factories, tanneries; also manufactories of pumps, wagons, chairs, sashes, doors, and blinds, clothing, rectified coal oil, extract of hemlock bark. Near its county seat, above a suspension bridge that spans the stream, is the great Susquehanna boom, coasting $1,000,000, which will hold 300,000,000 ft. of lumber. It is traversed by the Northern Central railway, the Muncy Creek railroad, the Philadelphia and Erie, the Catawissa and Williamsport railroad, and the West Branch canal, the latter principally used in the transportation of coal. Seat of justice, Williamsport.

LYCON, a Greek philosopher; B.C. 300–226; b. in Laodicean Phrygia. He was a philosopher of the school of Aristotle, was at the head of that sect B.C. 270, and succeeded Aristotle, Theophrastus, and Strato in the school which they had taught at Athens. He is described as a very successful instructor, discarding corporal punishment, and inciting the pupil by appealing to his honor. His eloquence was so persuasive and melodious that his contemporaries prefixed the letter G to his name, making it *Glycon*, which denotes *sweetness*. He conducted the school with great ability for 42 years. From Cicero we learn that he wrote on the boundaries of good and evil, and a work of his on the nature of animals is quoted by Apuleius.

LYCOPERDON. See PUFF-BALL.

LYCOPHRON, a distinguished poet and grammarian; b. Chalcis in the island of Eubœa, B.C. 280. We know but little of his private history. He lived at the court of Ptolemy Philadelphus, where he was one of the seven poets, known by the name of *Pleiad*. He wrote many tragedies, of which Suidas has preserved the titles of 19, but the works are lost, except *Cassandra* or *Alexandra* of 1474 lines. This is, however, hardly a drama, as Cassandra is the only speaker. She gives an account of nearly all the leading events in Greek history. It is written in iambic in a style very obscure, and has no poetical merit. The best edition is by Bachman. He is said to have written also some satires and comedies.

LYCOPODIACEÆ, a natural order of acrogenous or cryptogamous plants, somewhat resembling mosses, but of higher organization, and by many botanists included among ferns as a sub-order. They have creeping stems and imbricated leaves. The axis consists entirely, or in great part, of annular vessels; the leaves are narrow and 1-nerved. The *thecæ*, or spore-cases, are axillary, sessile, 1 to 3 celled, opening by valves, or not at all, and often of two kinds, the one containing minute powdery matter, the other sporules of much larger size, which are capable of germinating. The powdery particles have by some been regarded as *antheridia* (see ANTHERIDIUM), but the question of their nature is still involved in uncertainty. The lycopodiaceæ are most abundant in hot humid situations, especially in tropical islands, although some are found in very cold climates. About 200 species are known. The only British genus is *lycopodium*, of which 6 species are natives of Britain. The most abundant, both in Britain and on the continent of Europe, is the common CLUB-MOSS (*L. clavatum*), which creeps upon the ground in heathy pastures, with branching stems, often many feet long. A decoction of this plant is employed by the Poles to cure that frightful disease the *plica polonica*. The yellow dust or meal which issues from its spore-cases, and from those of *L. Selago*, is collected and used for producing the lightning of theaters, being very inflammable, and kindling with a sudden blaze when thrown upon a candle, the combustion taking place so rapidly that nothing else is liable to be kindled by it. It is called *lycopode* and *vegetable brimstone*, and by the Germans, *lightning-meal* and *witch-meal* (*Blitz-mehl* and *Hexen-mehl*). It is used for rolling up pills, which, when coated with it, may be put into water without being moistened. It is sprinkled upon the excoriations of infants, and upon parts affected with erysipelas, herpetic ulceration, etc. It is even used, although rarely, as a medicine in diseases of the urinary organs. The powder of other species is also regarded in Brazil and other countries as possessing power over the urinary and generative organs. The stems and leaves of *L. clavatum* are emetic, those of *L. Selago* cathartic; a South American species, *L. catharticum*, is violently purgative, and is administered in cases of elephantiasis. *L. Selago* is employed by the Swedes to destroy lice on swine and other animals. *L. alpinum* is used in Iceland for dyeing woolen cloth yellow, the cloth being simply boiled with a quantity of the plant and a few leaves of the bog whortleberry. *L. complanatum* is used for the same purpose in Lapland, along with birch-leaves. Many of the lycopodiaceæ are very beautiful plants, and are much cultivated in hot-houses, green-houses, and fern-cases, in which they grow very luxuriantly.

LYCURGUS, a celebrated Spartan lawgiver, whose history and legislation are involved in so much obscurity, that many modern critics have suspected them to be mythical. The account usually given is as follows: Lycurgus, who flourished about 880 B.C. (or, according to others, about 1100 B.C.), was descended from the old Doric family of the Proclidæ. His brother, Polydectes, king of Sparta, died, leaving his widow with child. This ambitious woman proposed to Lycurgus that he should marry her, in event of which she promised to destroy the fruit of her womb. Lycurgus was shocked, but feigned consent in order to save his brother's offspring. As soon as the child, who was named Charilaus, was born, he proclaimed him king, and became his guardian. At this time, Sparta is represented as being in a state of great disorder and demoralization —the different sections of the community quarreling among themselves for political supremacy. Lycurgus after some years left his native country, and traveled through many foreign lands—Crete, Asia Minor, India, Egypt, Libya, and Iberia—examining and comparing the political constitutions of the different countries, and finally returned to Sparta, full of knowledge fitting him to become one of the greatest legistators in the world. During his absence, things had got much worse in Sparta, and he had no sooner arrived than the entire community requested him to draw up a constitution for them. To this he consented, and having induced them to solemnly swear that they would make no change in his laws till he came back, he again left Sparta, and was never more heard of. By this mysterious self-expatriation, he hoped to make the Spartan constitution eternal. The people now saw that he was a god; a temple was erected in his honor, and annual sacrifices were ever afterwards offered to him. No critical scholar considers such a biography historical; the most that can be assumed as probable is, that a certain Lycurgus may have once existed, who at some critical juncture in Spartan affairs may have been selected, probably on account of his wisdom and reputation, to draw up a code of laws for the better government of the state. To represent the entire legislation of Sparta as invented (so to speak) by Lycurgus, and imposed upon the people as a novelty, is simply incredible; the only theory worth a moment's consideration is that which supposes

him to have collected, modified, improved, and enlarged the previously existing institutions of Sparta (q. v.).

LYCURGUS, B.C. 400–323; b. Athens; was one of the renowned orators of Greece. In his early years he studied philosophy under Plato, and the political constitution of his country under Isocrates. In 343 B.C. he took an active part in political affairs, and was one of the ambassadors with Demosthenes appointed to counteract the intrigues of Philip in different parts of Greece. He was appointed to preside over the public revenue for four years, and so much confidence had the people in his integrity that he was continued in the office for 12 or 15 years. Lycurgus was one of the 10 orators demanded by Alexander after the destruction of Thebes, but the Athenians refused to give him up. He was buried in the Academia. Fifteen years after his death, upon the ascendency of the democratic party, a decree was passed by the Athenians that public honors should be paid him; a brazen statue of him was erected in the Ceramicus, and the representative of his family was allowed the privilege of dining in the Prytaneum. The monument recited his uncorrupted fidelity. Many persons confiding in his honesty intrusted to his custody large sums of money. Böckh considers him the only statesman of antiquity who had a real knowledge of the management of finance. He greatly increased the revenue, erected many public buildings, completed the docks, the armory, and the theater of Bacchus. After the defeat of the Greeks at Cheronea, 338 B.C., he caused the prosecution and condemnation of Leocrates, an Athenian general, for abandoning Athens after the battle, and settling in another Grecian state. In the time of Plutarch and Photius 15 of his orations were extant; but the only one preserved is that against Leocrates.

LYDDA, a t. of Palestine, in the tribe of Ephraim, 9. m. e. of Joppa, on the road between that place and Jerusalem. It is called in the Old Testament and the Apocrypha, Lod, and was built by the Benjamites. In the New Testament it is noticed as the place where Peter healed Æneas. Some years later it was burnt by Cestius Gallus in his march against Jerusalem. Rebuilt, it was at the head of one of the toparchies of the later Judea. It is described by Josephus as being at that time equal to a city, and the rabbins speak of it as a seat of Jewish learning. It was afterwards destroyed by Vespasian, but rebuilt by Hadrian and called Diospolis, under which name it occurs on the coins of Severus and Caracalla. It was a well-known and much frequented place in the time of Eusebius, 320–30. It was early the seat of a bishopric. In 415 a council of 14 bishops was held here, before which Pelagius was accused of heresy, but acquitted. The last bishop of Lydda was Apollonius. The celebrated St. George is said to have been born at Lydda, and suffered martyrdom at Nicomedia under Diocletian and Maximilian at the end of the 3d c.; it was reported that his remains were transferred to Lydda, and that a church was erected in his honor by the emperor Justinian. This church having been destroyed by the Moslems, was rebuilt by the crusaders, who established a bishopric of Lydda and Ramleh. The crusaders invested St. George with the dignity of their patron, and he thus became the patron saint of England and other states and kingdoms. The church was destroyed by Saladin in 1191, the ruins of which are in the eastern part of the town. The western part of the church has been built into a large mosque. As the city of St. George it is held in great honor by the Moslems. From the time of Saladin but little notice is taken of it by travelers. It is in a fruitful plain, 3 m. e. of Jaffa, under the name of Ludd, or Lidd, and, for a Mohammedan town, has some activity in business.

LYDGATE, JOHN, 1375–1460; b. England; educated at Oxford and ordained in 1397. He traveled on the continent and studied Italian and French literature, particularly the works of Dante, Boccaccio, and Alain Chartier. On his return to England he opened a school in his monastery. He was not only a *belles-lettres* scholar, but familiar with theology, philosophy, and astronomy. His poetical writings are voluminous, and we may mention *The History of Troy*, *The Story of Thebes*, and *The Fall of Princes*, the latter a translation from a French version of Boccaccio's *De Casibus Vironem Illustrium*. The *History of Troy* or *Troye-Book* is a paraphrase of Guido de Colonna's *Historia Trojana*. A collection of his minor poems edited by J. O. Halliwell, was published by the Percy society in 1840.

LYD'IA, anciently a country of Asia Minor, bounded on the w. by Ionia, on the s. by Caria, on the e. by Phrygia, and on the n. by Mysia. It is said to have been originally inhabited by a people called Mæonians (whether of Semitic or Indo-Pelasgic origin is much disputed by modern ethnographers), who were subdued or expelled by the Lydians (about 720 B.C.), a Carian race. The country was mountainous in the s. and w. —the principal range being that of Tmolus. It was celebrated for its fruitful soil and for its mineral wealth, particularly for the gold of the river Pactolus and of the neighboring mines, but was infamous for the corruption of morals which prevailed amongst its inhabitants, and especially in Sardis (q.v.), its capital. Lydia attained its highest prosperity under the dynasty of the Mermnadæ (*circa* 700–546 B.C.). The first of this dynasty was the half-mythical Gyges (q.v.)—the last was the famous Crœsus (q.v.), celebrated for his prodigious wealth. The subsequent history of Lydia is unimportant. Its antiquities have not yet been sufficiently explored. Compare Niebuhr's *Lectures on Ancient History*, Hamilton's *Researches*, and Menke's *Lydiaca, Dissertatio Ethnographica*.

LYDIAN MODE, one of the ancient Greek authentic modes in music, which was retained as one of the old church modes, the notes being F, G, A, B, C, D, E, F, the same as in our modern diatonic scale. Since the reformation the melodies in the Lydian mode have entirely disappeared, and the Lydian mode is used only occasionally in modulation from other modes.

LYDIAN STONE, a variety of flinty slate, but less hard than common flinty slate, and not of a slaty structure. It occurs in Britain and in many other countries, but was first brought from Lydia. It is generally grayish black, or quite black and velvet-like. It is polished and employed as a touchstone for trying the purity of gold and silver by comparison of colors.

LYE, a term sometimes used to denote all solutions of salts, but more generally appropriated to solutions of the fixed alkalies, potash and soda, in water. The solutions of caustic potash and soda are called caustic lyes; those of their carbonates, mild lyes. The fluid which remains after a substance has been separated from its solution by crystallization is called the *mother lye.*

LYELL, Sir CHARLES, an eminent geologist of the 19th c., was the eldest son of Charles Lyell, esq., of Kinnordy, Forfarshire. He was born in 1797, and after receiving his early education at Midhurst, in Sussex, was entered at Exeter college, Oxford, where he graduated as B.A. in 1819. Here he attended the lectures of Buckland, and thus acquired a taste for the science he afterwards did so much to promote. After leaving the university he studied law, and in due time was called to the bar; but his circumstances not rendering a profession necessary for a livelihood, he soon abandoned the law and devoted himself to the prosecution of geology. To extend his knowledge in this department of science he made geological tours in 1824, and again in 1828–30, over various parts of Europe, and published the results of his investigations in the *Transactions of the Geological Society* and elsewhere. The first volume of his great work, *The Principles of Geology,* appeared in 1830, the second in 1832, and the third in 1833. A third edition of the whole work appeared in 1834, a fifth in 1837, and the tenth was published in 1868. This work was divided into two parts, which have been subsequently published as two distinct works—viz., *The Principles of Geology; or the Modern Changes of the Earth and its Inhabitants, as illustrative of Geology,* which has now reached its ninth edition; and *The Elements of Geology; or the Ancient Changes of the Earth and its Inhabitants, as illustrated by its Geological Monuments,* of which the sixth edition was published in 1865. *The Geological Evidences of the Antiquity of Man, with Remarks on Theories of the Origin of Species by Variation,* took a large proportion of the public very much by surprise in 1863—creating as it did the sensation of the season in the literature of science. The fourth edition of this remarkable work, enlarged and greatly improved, appeared in 1873. Lyell also published *A First and Second Visit to North America, Canada, Nova Scotia, etc., with Geological Observations,* in 4 vols., besides a number of important geological papers in the *Proceedings and Transactions of the Geological Society, the Reports of the British Association,* etc. Lyell was one of the early members of the geological society, and on the opening of King's college in 1832 he was appointed professor of geology, an office which he soon resigned. In 1836 and again in 1850 he was elected president of the geological society, and in 1864 president of the British association. He was knighted in 1848, and created a baronet in 1864. Lyell received the degree of D.C.L. from Oxford, and that of LL.D. from Cambridge. He died in 1875.

LYGO'DIUM, a genus of climbing ferns; fronds twining or climbing, bearing stalked and variously-lobed divisions in pairs, with free veins; fructification upon separate divisions, narrower than those which are sterile, and bearing upon the back two rows of scale-like inclusiæ, each of which generally covers only a single spore-case, which has a ring at the apex and opens by a longitudinal slit. There are several species which are natives of warm countries. Only one species is found in North America from Massachusetts to Kentucky, south of which it is rare, and much more abundant in Kentucky than eastward. The fronds are from one to four ft. high, and spring from slender running root-stocks, climbing upon other plants. It is a very delicate and graceful fern, and is much used for ornamental purposes, both fresh and dried. It grows in shaded or moist grassy places. A favorite locality is East Windsor hill, Conn., also the vicinity of Hartford, and of Springfield, Mass.

LYLY, JOHN, an English dramatist, b. in Kent about 1554; studied at Magdalen college, Oxford, and took his degree of M.A. in 1575. Of his career nothing is known except that he lived in London, and supported himself by his pen. He died early in the 17th century. Lyly wrote nine plays, most of which are on classical subjects—as *Sappho and Phaon, Endymion, Midas, Galathea,* and the *Maid's Metamorphosis*—the lyrics of which frequently display a sweet and graceful fancy; but the two works which have chiefly perpetuated his name are *Euphues, or the Anatomy of Wit,* and *Euphues and his England.* They are written in prose, and are marked by great affectation, bombast, and pedantry in the language and imagery; yet Lyly is said to have intended them for models of elegant English, and such the court of Elizabeth at least undoubtedly thought them. According to Lyly's editor, Blount, "that beauty at court which could not parley euphuism, that is to say, who was unable to converse in that pure and

reformed English which he had formed his work to be the standard of, was as little regarded as she which now there speaks not French."

LYMAN, a co. in s. Dakotah, having the Missouri river for its e. border, is watered by the White river and its branches, emptying into the Missouri; 700 sq.m.; pop. '80 (combined with a part of Aurora, Buffalo, and Presho counties), 232. It is largely taken up by Indian reservations, but much of it is rich bottom lands, with excellent grazing pastures on the bluffs, and a large proportion of good prairie land. It is well timbered for that section of the country.

LYMAN, CHESTER SMITH, b. Manchester, Conn., 1814. Becoming interested as a boy in astronomy and the kindred sciences, he studied them without a master, constructing for himself optical and astronomical apparatus, making almanacs for 1830 and 1831, and computing eclipses 15 years in advance. He graduated at Yale in 1837, and, after teaching two years, studied theology at the Union seminary (New York) and the Yale divinity school; was pastor of a Congregational church in New Britain, Conn., 1843–45; on account of failing health in 1845 went to the Sandwich Islands, where he taught the royal school, having as pupils four young men who afterwards successively occupied the Hawaiian throne. He went to California in 1847, whence he sent to the eastern states some of the earliest authentic accounts of the discovery of gold. In 1850 he settled in New Haven, engaging in scientific pursuits. He was one of the revisers of Webster's *Dictionary* (edition of 1864), taking charge especially of scientific words. In 1859 he became professor of industrial mechanics and physics in Yale college, taking an active part in organizing the Sheffield scientific school, in which he was the astronomical teacher. He has been a contributor to the *American Journal of Science*, the *New Englander*, and other periodicals, and is the author of various useful inventions, among which are a wave apparatus and a pendulum apparatus for acoustic curves. He is a member of various scientific bodies; among them, the British association for the advancement of science.

LYMAN, HENRY, 1810–34; b. Mass.; graduated Amherst college, 1829; Andover theological seminary, 1832; studied medicine at Boston and at Brunswick, Me.; sailed with the rev. Samuel Munson from Boston, 1833, as a missionary of the American board, with instructions to explore the Indian archipelago. They landed at Batavia in September; in April, 1834, they visited Padang, the Battoo group, Pulo Niyas, and Sumatra. Here they undertook to reach the Battas of the interior. They were dissuaded on account of rumors of war, dangers from wild beasts, and other hardships of the journey; but proceeded on foot with a few native attendants. Five days brought them to the village of Sacca, which was at war with a neighboring village. Before they could explain their errand they were surrounded by 200 armed men, and notwithstanding that they gave up the arms which they had taken for defense against wild beasts, Mr. Lyman was shot and Mr. Munson pierced with a spear. When the people of the neighboring villages learned by the reports of natives on the road that the strangers were good men who sought to benefit the Batta people, they combined to avenge their death, and surprised and destroyed the village of Sacca, killing many of the inhabitants. The report that the bodies of these missionaries were eaten is thought to be incorrect. Mr. Lyman published *Condition of Females in Pagan Countries*. Among the Battas whose country the martyrs attempted to explore, the Rhenish missionary society established a mission in 1861, which now has eleven stations and 1500 baptized converts.

LYMAN, PHINEAS, 1716–75; b. Conn.; educated at Yale, and admitted to the bar. Appointed commander-in-chief of the Connecticut forces in the French war he founded fort Lyman, now fort Edward, New York; at the battle of lake George took command of the colonial forces after sir William Johnson was wounded; was present at the capture of Crown Point and Montreal; and in 1762 was at the head of the colonial troops in the expedition against Havana. From 1763 to 1774 he was in England, endeavoring to get a grant of land along the Mississippi from the government. A tract in the vicinity of Natchez was granted to the company for which he was agent, in the latter year; and he took over a company of immigrants, but died soon after arriving in west Florida.

LYMAN, THEODORE, 1792–1849; b. Boston; graduated at Harvard in 1810; visited Europe in 1814, and published in the same year a small volume, *Three Weeks in Paris*. After studying law he made a second visit to Europe, returning from which he published in 1820 *The Political State of Italy*. In 1820 he was Boston's chosen orator for the Fourth of July. In 1823 he wrote an *Account of the Hartford Convention*, defending its proceedings and the motives of the men who called it. In 1826 he published *The Diplomacy of the United States with Foreign Nations*. He was an active politician, and served in both branches of the legislature. From 1832 to the close of 1835 he was mayor of Boston, and in August of the latter year presided at the great pro-slavery meeting in Faneuil hall, the proceedings of which so inflamed the disorderly spirit of the time that a mob of "gentlemen of property and standing," a few weeks later, broke up a meeting of anti-slavery women, and was with difficulty prevented from taking the life of William Lloyd Garrison. The mayor, instead of seeking to disperse the mob, ordered the ladies, who had peacefully assembled for anti-slavery discussion and prayer, to give up their meeting and retire to their homes; but when he found that Mr. Garrison was in

the hands of the mob and likely to be killed, he made an earnest and successful effort for his rescue, and committed him to jail to save his life.

LYMAN, THEODORE BENEDICT, D.D., b. Mass., 1815; educated at Hamilton college and the general theological (Prot. Epis.) seminary of New York, and ordained in the Episcopal church. He was rector of churches in Hagerstown, Md., Pittsburg, Penn., of the American churches at Rome and Florence, and of Trinity church, San Francisco. In 1873 he was elected assistant bishop of North Carolina.

LYME GRASS, *Elymus*, a genus of grasses, the species of which are natives of the temperate and colder regions of the northern hemisphere. The spikelets grow in pairs from the joints of the *rachis*, and each has 2 to 4 fertile florets, and two awnless glumes, both on the same side.—The SEA LYME GRASS (*E. arenarius*) is frequent on the sandy shores of Britain and other parts of Europe. It is a coarse, grayish grass, often three or four feet high, with spiny-pointed leaves and upright close spikes; a perennial with creeping roots, very useful in binding the sand. On this account, it is much sown on the shores of Holland, and also to some extent on those of Britain. In Iceland and other countries, it is used for thatch. The seed, which is large, is collected in Iceland, and ground into meal, which is made either into porridge or into soft thin cakes, and is esteemed a great delicacy.—A closely allied species or a variety, called GIANT LYME GRASS (*E. giganteus*), is often sown in Holland, being preferred for its more vigorous growth.—Various expedients are adopted to secure the growth of lyme grass seeds in very loose sands, as the laying down of pieces of turf, a gradual advancement from the margin of the sand, etc.

LYME RE'GIS, a seaport, municipal and parliamentary borough and watering-place of England, in Dorsetshire, is situated at the mouth of a rivulet called the Lym, 26 m. w. of Dorchester. It received its first charter in the middle of the 13th c., and was a port of considerable importance during the reign of Edward III., for whom it provided three ships to assist in the siege of Calais in 1346. Its pier, called the *Cobb*, is semicircular in form. It returns one member to parliament. In 1872, 79 vessels of 4,592 tons, in the foreign, colonial, and coasting trade, entered and cleared the port. Pop. '71, 2,333.

LY'MINGTON, a sea-port, market-town, and municipal and parliamentary borough of England, in the county of Hants, at the mouth of a river of the same name, and on a creek communicating with the Solent, 18 m. s.s.w. of Southampton. Salt has long been manufactured; some of the salt works being of great antiquity, and possibly of British origin. Lymington is also of some importance as a watering-place. It commands fine prospects of the isle of Wight and the English channel, and its vicinity abounds in charming scenery. Lymington returns two members to parliament. Pop. '71 of parliamentary borough, 5,356.

LYMPH (Gr. *lympha*, water) is the term applied by physiologists to the fluid contained in the lymphatics (q.v.). It is a colorless or faintly yellowish red fluid, of a rather saltish taste, and with an alkaline reaction. It coagulates shortly after its removal from the living body, and forms a jelly-like, semi-solid mass, which continues for some time to contract, so that at last the clot is very small, in proportion to the expressed serum. On microscopic examination, the lymph is seen to contain corpuscles which do not in any respect differ from the colorless blood-cells, molecular granules, fat globules, and occasionally blood corpuscles. The chemical constituents of lymph seem to be precisely the same as those of blood, excepting the substance peculiar to the red corpuscles.

From experiments on animals, it has been inferred that upwards of 28 lbs. of fluid (lymph and chyle) pass daily into the blood of an adult man.

The lymph seems to owe its origin to two distinct sources, viz., to the ultimate radicles of the lymphatic system, which contribute the homogeneous fluid portion, and the lymphatic glands, which contribute the corpuscles, granules, etc., seen under the microscope.

The uses of the fluid are twofold: in the first place, to convey from the tissues to the blood effete matters, to be afterwards excreted by the skin, lungs, and kidneys; and secondly, to supply new materials for the formation of blood.

LYMPHATICS, the vessels containing the lymph (q.v.), are also called *absorbents*, from the property which these vessels possess of absorbing foreign matters into the system, and carrying them into the circulation. The lymphatic system includes not only the lymphatic vessels and the glands through which they pass, but also the lacteals (q.v.), which are nothing more than the lymphatics of the small intestine, and only differ from other lymphatics in conveying chyle (q.v.) instead of lymph during the latter part of the digestive process.

The lymphatics are minute, delicate, and transparent vessels, of tolerable uniformity in size, and remarkable for their knotted appearance, which is due to the presence of numerous valves, for their frequent dichotomous divisions, and for their division into several branches before entering a gland. They collect the products of digestion and the products of worn-out tissues, and convey them into the venous circulation near the heart. They are found in nearly every texture and organ of the body, excepting the substance of the brain and spinal cord, the eyeball, cartilage, tendon, and certain fetal strictures, and possibly also the substance of bone.

The lymphatics are arranged in a superficial and a deep set. The superficial vessels on the surface of the body lie immediately beneath the skin, and join the deep lymphatics in certain points through perforations of the deep fascia; while in the interior of the body they lie in the sub-mucous and sub-serous areolar tissue. They arise in the form of a net-work, from which they pass to lymphatic glands or to a larger trunk. The deep lymphatics are larger than the superficial, and accompany the deep blood-vessels; their mode of origin is not known with certainty. The structure of the lymphatics is similar to that of veins and arteries.

The lymphatic or absorbent glands are small, solid, glandular bodies, varying from the size of a hemp-seed to that of an almond, and situated in the course of the lymphatic vessels. They are found in the neck (where they often become enlarged and inflamed, especially in scrofulous subjects), in the axilla, or arm-pit, in the groin (where, when inflamed, they give rise to the condition known as *bubo*), and in the ham; while deep ones are found abundantly in the abdomen and the chest.

The lymph of the left side of trunk, of both legs, of the left arm, and the whole of the chyle, is conveyed into the blood by the thoracic duct (q.v.); while the lymph of the right side of the head, neck, and trunk, and of the right arm, enters the circulation at the junction of the axillary and internal jugular veins on the right side, by a short trunk, guarded at its opening by valves.

LYNCH, Henry Blosse, 1798–1873; b. Ireland; entered the navy in 1823, and served in the east for most of the time till his retirement in 1854. He was familiar with Persian and Arabic, and in the early part of his career acted as interpreter, and carried on negotiations with native tribes. He was next in command to col. Chesney, in the Euphrates expedition of 1834, and subsequently held command in the Indian navy.

LYNCH, Patrick Nilson, D.D., b. Cheraw, S. C., 1817; studied theology in the Roman Catholic seminary at Charleston in 1834, and in the college of the propaganda at Rome; was ordained priest in 1840; returned to Charleston, and was appointed rector of the seminary and professor of theology. After serving as rector of St. Mary's parish and of the cathedral, he became vicar-general in 1850; was appointed by the pope in 1857 bishop of Charleston. During his administration he built the fine cathedral of St. Michael's and other churches, founded an Ursuline convent and an orphan asylum, and established many schools. Some of these having been destroyed in the war, he has traveled extensively in the north since 1865 collecting funds for their restoration. He has published some theological and scientific essays. In 1869 he was a member of the Vatican council, and sustained the dogma of papal infallibility.

LYNCH, Thomas, Jr., 1779–1849; b. S. C.; educated in England, where he studied law. Returning to South Carolina in 1772, he became identified with the resistance of the colonies to Great Britain; was elected to the continental congress in 1776, to fill a vacancy occasioned by the death of his father, and was one of the signers of the declaration of independence.

LYNCH, William F., 1801-65; b. Va.; an officer in the naval service of the United States. In 1848 he conducted a valuable official survey of the Jordan river and the Dead sea. He became commander in 1849, captain in 1856, and deserted to the confederacy in 1861, in which service he was given the rank of commodore.

LYNCH'BURG, a city of Virginia, on the James river, 120 m. w.s.w. of Richmond, remarkable for picturesque situation and scenery. It has 10 churches, a college, 40 tobacco factories, 2 iron foundries, etc. Pop. '70, 6,825.

LYNCH'BURG (*ante*), situated on the s. bank of the James river, and on the James river and Kanawha canal. It is 90 m. from Richmond, and is the point of junction of the Atlantic, Mississippi and Ohio, and Washington City, Virginia Midland and Great Southern railroads; pop. '80, 15,959. The situation of the city is picturesque and romantic in the extreme. Here a steep acclivity rises gradually from the banks of the river, breaking into numerous hills as it completes its elevation, whose terraced walks, ornamented with trees and skirting handsome dwellings, present a most pleasing appearance. In the background, at a distance of 20 m., but fully in view, rise the Blue Ridge and the Peaks of Otter, standing in bold relief against the sky. This city derives its chief importance from being the center of an enormous tobacco manufacture, and on account of its comprehensive railroad facilities. Vast fields of coal and iron-ore are in the immediate neighborhood, and not far are the celebrated Botetourt iron-works. Lynchburg dates back to 1786. It was used as a base of supplies by the confederates during the rebellion. Its public buildings are numerous and well built; it possesses a thorough public school system, with graded and high schools; and has 13 churches and chapels.

LYNCH LAW, the name given in the United States of America to the trial and punishment of offenders in popular assemblies without reference to the ordinary laws and institutions of the country. This barbarous mode of administering justice has always more or less prevailed in every country in times of great popular excitement, and has been necessarily resorted to in countries newly settled, where the power of the civil government is not yet sufficiently established. The name is derived by Webster from a Vir-

ginian farmer; but a more interesting explanation is found in the story of James Lynch, mayor of Galway about 1495, who, in the spirit of Brutus, with his own hands hanged his son from a window for murder.

LYNCH LAW (*ante*) is said to have derived its name from one James Lynch, a farmer in Piedmont co., Va. As there was no regularly established court of law in the vicinity, the inhabitants were in the habit of bringing disputed questions, or the trial of criminals, before Lynch, who gave summary judgment according to his opinion of the facts, without any too strict adherence to the letter of the law. From the frequency with which he performed the duties of a judge, he came to be known as "judge" Lynch, and his name was given to the custom of violent, unauthorized trial and execution which has sprung up in the new and turbulent communities of the west and south in this country. It has gradually disappeared from most of those communities as their population has increased, and now lingers in only the least advanced of them. In a new country, in which justice cannot be administered, it seems sometimes a necessary evil. Though the name is commonly considered to have had its origin as described, its real origin is entirely problematical. It is also ascribed to other persons of the name of Lynch; one, the founder of the town of Lynchburg, Va.; the other, a person sent to this country from England, in the 17th c., under a commission to suppress piracy, and who is credited with having faithfully carried out his instructions to execute, without the formality of a trial, any pirate whom he could capture. According to another account, lynch law owes its name to James Fitzstephens Lynch, who was mayor of Galway in 1493. He carried on an extensive trade with Spain, where he sent his son, with a large sum of money, to buy wine. Young Lynch spent the money, but bought a cargo on credit from a Spanish merchant, whose nephew came to Ireland on the ship with young Lynch to collect the money. Lynch, to cover his own crime, threw him overboard. The murder was revealed by a sailor to the mayor of Galway, who tried and condemned his son; and when his family attempted to prevent the sentence from being carried into effect, himself acted as his son's executioner. Lynch law was anciently known in England by the name of Lydford law. Lydford, in Devonshire, was a walled town, with a castle, wherein the courts of the duchy of Cornwall were held. Persons accused of violating the laws of the duchy were imprisoned in so foul a jail, before being brought to trial, that Lydford law became a proverbial expression for summary punishment without trial. The same thing was variously called, in Scotland, Cowper law, Jedburgh justice, etc.

LYNDHURST, Lord (JOHN SINGLETON COPLEY), English lawyer and statesman, was the son of J. S. Copley, R.A., painter of the "Death of Chatham," and other esteemed works. The Copleys were an Irish family, the painter's grandfather having emigrated from the co. of Limerick, and settled at Boston, United States, where Lyndhurst was b. May 21, 1772. While he was yet an infant, his father removed to England for the practice of his art. Lyndhurst was educated at Trinity college, Cambridge, where he was second wrangler and Smith's prizeman in 1794, and a fellow in 1797. Called to the bar at Lincoln's Inn in 1804, he chose the midland circuit, and soon obtained briefs. In politics he was at first a liberal, and long expressed sentiments hostile to the ministry of the day. He ably defended Watson and Thistlewood on their trial for high treason in 1817, and obtained their acquittal. Some surprise was therefore expressed when, in 1818, he entered parliament for a government borough. In 1819 he became solicitor-general in the Liverpool administration, and in 1823 was promoted to the rank of attorney-general. It was much to his credit that, unlike his predecessors, he instituted no *ex-officio* informations against the press. In 1826 he became master of the rolls. When Mr. Canning was charged to form a ministry in 1827, he offered the great seal to Lyndhurst (then sir John Copley), who was raised to the upper house, and remained lord chancellor from 1827 to 1830. In 1831 he became lord chief baron of the exchequer, which office he exchanged for the woolsack during the brief administration of sir R. Peel in 1834. In 1835 he led the opposition to the Melbourne ministry in the upper house, in speeches of great power and brilliancy. Lyndhurst's orations and annual reviews of the session did much to reanimate the conservative party, and pave the way for their return to power in 1841. He then became lord chancellor for the third time, and held the great seal until the defeat of the Peel government in 1846. After that time he took little part in home politics; but his voice has often been heard on matters of foreign policy, and in denunciation of tyranny in Italy and elsewhere. He died in London, Oct. 12, 1863. Lyndhurst's high attainments as a lawyer have never been questioned, and his judgments—of which that in the great case of Small *v.* Attwood may be particularly cited—have never been excelled for clearness, method, and legal acumen. In the house of peers he had few equals among his contemporaries. So near his end as 1860, when he was 88 years of age, he maintained, with great force and ability, the right of their lordships to reject the paper-duties bill—an act which the lower house resented as a breach of its privileges.

LYNDON, a t. in Caledonia co., Vt., on the Connecticut and Passumpsic railroad, 40 m. e. of Montpelier, and about the same distance s. from the Canada line; pop. 2,179; has 5 churches, a college under Baptist control, a large and flourishing academy and graded

school, a national bank, a weekly newspaper, the offices and repair-shops of the Connecticut and Passumpsic railroad, several carriage factories, mills, stores, shops, etc.

LYNN, a city of Massachusetts, 9 m. n.e. of Boston, in which nearly the whole population is engaged in the manufacture of boots and shoes, leather, lasts, and works connected with this manufacture, which employs about 10,000 hands. Much of this manufacture has been for the southern states. The value of the boots, etc., annually shipped is 13 to 14 million dollars. Lynn has 30 churches, 58 public day-schools, 5 banks, 4 newspapers. Pop. '70, 28,233.

LYNN (*ante*), a city in Massachusetts, settled 1629, incorporated 1850; extending for 3 m. along the Atlantic shore, having a small harbor lying w. of the peninsula of Nahant, in the n. portion of Massachusetts bay; about 10 sq.m.; pop. '80, 38,284. It is directly connected with Boston by the Boston, Revere Beach and Lynn narrow-gauge railroad, and by a horse railroad. The Eastern railroad passes through it, connecting it with Salem, 5 m. away. It is the terminus of the Saugus to Everett branch of the Eastern railroad, and is 2 m. from the watering-place of Nahant. It contains a free public library of about 19,000 vols., and 3 handsome and commodious halls, besides a fine brownstone city hall, costing $311,722. The capital of its 3 national banks, collectively, is $1,000,000. It has 2 fire insurance companies. Many fine brick buildings for the purposes of manufacture and trade have been erected, but the residences are mostly of wood. A large number of beautiful villas are occupied by residents of the neighboring cities, who find the beach a great attraction. The n. section is thinly settled, and thick forests appear in the suburbs. Its shipments to the s. and w. of boots, shoes, and brogans, as estimated for one year, amounted to 10,000,000 pairs, worth $18,000,000. The beginning of its prosperity was in 1750. The present capital employed is estimated at $1,000,000, occupying 200 establishments, and using the McKay sole-sewing machine. The leather interest employs $500,000 capital, some of the factories tanning and finishing 5,000 skins a week. The Saugus river flows along the w. boundary, emptying into the harbor, and its e. boundary is formed by a succession of lakes or ponds called Flax, Cedar, etc. In the center of the city is a hill called High Rock, 185 ft. in height, belonging to a range of hills that forms its n. background. The rest of the city is built on flats but a few feet from the water level. It has a beautiful common and a number of little public parks, and 2 cemeteries, called Pine Grove and St. Mary's, laid out in a picturesque manner, and ornamented with rare flowers, which are tended with care. Two ponds, Breed's and Birch, supply the waterworks, built at a cost of $800,000, requiring 2,000,000 galls. per day. The apparatus used is of the best for the purpose, and the reservoir-pressure is 177 ft. It has a soldiers' monument of bronze and granite, costing $30,000, dedicated in 1873. It has a considerable coasting trade, and is engaged in fishing. Its city government is composed of a mayor, board of aldermen with 8 members, and a common council of 22. It has a well-organized fire department, with an electric alarm, and its school buildings are on the best modern plan as to ventilation, modes of egress, etc. It has 8 evening schools. It holds the remains of the original iron-works of America in the shape of an ancient forge, and it is the place where the first fire-engine was made. It originally comprised the town of Swampscot, organized in 1852, and Nahant, organized in 1853. In 1861, at the call of the state for troops, it returned the significant response, "We have more men than guns; what shall we do?"

LYNN, LYNN REGIS, or KING'S LYNN, a seaport, municipal, and parliamentary borough of England, in the county of Norfolk, is situated about 3 m. from the mouth of the Great Ouse, and 41 m. w.n.w. from Norwich. It was formerly fortified, and the old moat still forms the eastern boundary of the town, and portions of the walls remain. The grammar school, with an annual income from endowment of £75, has six exhibitions for Cambridge. Ropes are manufactured here, and ship-building is carried on. Great numbers of shrimps are caught, and sent to London. The imports are corn, oil-seed cake, cork, sulphur, wine, coal, and timber. In 1872, 914 vessels in the foreign, colonial, and coasting trades, of 92,961 tons, entered and cleared the port. It returns 2 members to parliament. Pop. '71, 17,266.

LYNX, a genus of *felidæ*, having a less elongated form than many others of that family, the body elevated at the haunches, long fur, a short tail, and the ears tipped with tufts or pencils of hairs. They are less courageous than other felidæ of similar size, and prey on small quadrupeds and birds. In pursuit of birds, they climb trees. They are generally of a sullen and suspicious temper, and not easily tamed. To this genus belongs the caracal (q.v.), which is probably the lynx of the ancients. The species are pretty numerous, and widely distributed, but the distinctions of species and varieties are somewhat uncertain. The EUROPEAN LYNX (*L. virgatus*) is common in many parts of Europe and Asia, chiefly in mountainous and wooded districts. Its color is variable, but generally of a dark reddish gray, spotted with reddish brown, the belly whitish. It is about 3 ft. long. It is proverbial for acuteness of sight. It is hunted in winter for its fur, which is always in demand in the market; but many of the lynx skins imported from the n. of Asia probably belong to other species: those of North America, and probably also many of those of the n. of Europe and of Asia, are the skins of the CANADA LYNX (*L. Canadensis* or *L. borealis*), which is generally of a hoary-gray color, a broad space along the back blackish brown. It is rather larger than the European lynx, and

more clumsy in form.—The BAY LYNX (*L. rufus*) is found in more southern parts of North America, both in mountainous and swampy districts, and often makes great havoc among poultry. It is commonly called in America the wildcat.

LYON, a co. in n.w. Iowa, having the state line of Minnesota for its n.e. boundary, the territorial line of Dakotah for its n.w., the Sioux river, an affluent of the Missouri, for its w. border, forming a part of the Dakotah line; 650 sq.m.; pop. '80, 1968—1551 of American birth. It is drained by Rock river, sometimes called Inyan Reakah (river of the rock), and the East fork. Its surface is formed of undulating prairies nearly destitute of timber; extensive willow hedges have been planted in certain sections. Sioux quartzite is found in the w. portion. Its soil is fertile and well adapted to stock-raising, and the production of oats, corn, wheat, and potatoes. Its inhabitants are principally engaged in agriculture. Seat of justice, Rock Rapids.

LYON, a co. in e. Kansas, intersected by the Missouri, Kansas and Texas railroad, and the Atchison, Topeka and Santa Fe railroad, forming a junction at Emporia; 850 sq.m.; pop. '80, 17,327—15,416 of American birth, 1029 colored. It is drained by the Neosho river, Osage river in the extreme n.e., and Cottonwood creek. Its surface is undulating, and adapted to stock-raising and the production of every variety of grain, tobacco, wool, sweet potatoes, dairy products, and sorghum. It produced in '70, 2,252 lbs. of honey. Along the water-courses are small groves of oak, hickory, cottonwood, and walnut, but the larger proportion is open prairie land with under-strata of limestone, beds of bituminous coal, and every element of fertility. Cash value of farms in '70, $2,551,968, numbering 792. It had in '70, 11 manufacturing establishments, consisting of flouring-mills, saw-mills, brick kilns, foundries, broom factories, furniture, soap and cheese factories, and woolen mills. Seat of justice, Emporia.

LYON, a co. in w. Kentucky, having for its s.w. boundary the navigable Tennessee river, and for its n.w. the river Cumberland, which also is an important commercial channel flowing through it centrally, and through one of its affluents forming the n. border; 320 sq.m.; pop. 80, 6,768—6,723 of American birth, 1488 colored. It is intersected by the Paducah and Elizabethtown railroad. Its surface is generally level and well timbered; containing rich beds of coal and iron ore. Its soil, fertile along the water-courses, is adapted to the raising of stock, for which this region is famous. It has good pastures throughout the year, and produces oats, corn, rye, wheat, and the products of the dairy, tobacco, wool, sweet potatoes, wine, and sorghum. It produced in '70, 4,493 lbs. of honey. It has manufactories of hubs and spokes, rolling mills in which boiler iron is manufactured, lime kilns, etc. It had in '70, 11 manufactories, employing 217 hands, with a capital of $413,000, and an annual product of $560,360. Seat of justice, Eddyville.

LYON, a co. in s.w. Minnesota, having the Yellow Medicine river, a branch of the Minnesota, in the extreme n., near the boundary line; also the head waters of two other branches, the Redwood and Big Cottonwood; 720 sq.m.; pop. '80, 6,257—4,558 of American birth, 2 colored. Its surface is rolling, and spreads out into fertile prairies, diversified by numerous small lakes. It is intersected centrally by the Winona and St. Peter railroad, crossing all the rivers. It has manufactories of brick and lumber. Seat of justice, Marshall.

LYON, a co. in w. Nevada, intersected centrally by the Carson river, is bounded on the n.w. by the Washoe mountain range, and drained by a lake in the s. portion; 480 sq.m.; pop. '80, 2,409—1191 of American birth, 396 colored. Its surface is mountainous, with very few trees. It contains a part of Carson valley and Walker river valley, having a very fertile soil and affording good pasturage. It produces oats, corn, and potatoes, and yields immense quantities of silver. Its leading industries are lumber-sawing and the milling and smelting of ores. Gold, borax, salt, and copper are abundant. Its manufacturing establishments are mostly iron foundries and machine shops, of which in '70 it had 24, employing 387 hands, with a capital of $537,500, and an annual product of $1,830,165. Seat of justice, Dayton.

LYON, CALEB, LL.D., 1822–75; b. at Lyonsdale, N. Y., a place founded by his father; graduated at Norwich (Vt.) university in 1841; traveled in Europe; was appointed by president Polk consul at Shanghai, China. After returning home he visited Mexico, Brazil, Chili, Peru, and other countries; was in California in 1849, serving as secretary of the constitutional convention, and designing the coat-of-arms of that state; made a second visit to Europe, going also to Egypt and Palestine; identified himself with the "Koszta affair" at Smyrna; was elected to the New York assembly and afterwards to the senate; was a member of congress in 1853–55; and governor of Idaho territory in 1864–66.

LYON, GEORGE FRANCIS, 1795–1832; b. Chichester, Eng.; entered the navy at the age of 13; joined the squadron of lord Exmouth for the attack on Algiers in 1816; accompanied the traveler, Joseph Ritchie, in his expedition to n. Africa in 1818. After many privations and perils in exploring Soudan, the course of the Niger, etc., he returned to England in 1820, and published his *Narrative of Travels in Northern Africa*. In 1821, in command of the *Hecla*, he accompanied capt. Parry in his voyage of discovery to Hudson's bay. Returning in 1823 he published in London an account of the

expedition. In 1824 he made an unsuccessful voyage with the *Griper* to Repulse bay in the Arctic regions, of which he gave an account in 1825. In 1826 he traveled in Mexico, spending some time in surveying its mines. Besides the works mentioned he published, *The Sketch Book of Capt. F. G. Lyon during Eighteen Months' Residence in Mexico, No.* 1, and *Journal of a Residence and Tour in the Republic of Mexico in* 1828.

LYON, MARY, 1797–1849; b. Mass.; in early life conscientious and noted for the ease with which she comprehended and memorized her lessons. At the age of 20, besides keeping up with her classes in their regular lessons, she daily committed and accurately recited so much of Adams's Latin grammar as it was usual for scholars to learn within three days. From 20 to 26 years of age we find her, now teaching to add to her scanty patrimony, now expending all she possessed in some one line of effort for mental improvement. In 1822 she united with the Congregational church in Buckland, Mass. Her schools in Ashfield and Buckland were noted for their religious influence and superior mental training. In 1824 she joined Miss Grant as assistant principal in her school in Derry, N. H. To her she ascribes the suggestion of some of those principles and methods which were so wisely and successfully tested in their schools in Derry and Ipswich, and also at South Hadley, and which were adopted later in Rugby, Eng., and in other institutions. They aimed to induce the pupils to govern themselves instead of being constrained by penalties, to act as under the eye of the heavenly Father, to aspire for the happiness which springs from doing good to others, even at a temporary sacrifice. For these ends the Bible was made one of the regular text-books of the school. In 1830 Miss Lyon became interested in the idea, then new in this country, at least among Protestants, of a *permanent* seminary for girls "with buildings, library, and apparatus, owned as colleges are, where successive generations of young ladies might be trained." She made great effort to secure this, but the object was not appreciated. She changed her plan. She now proposed to found an institution which should offer a thorough education on such terms as would be available for young women of moderate means. To preserve habits of home industry, to inspire a spirit of true independence and wise economy, it was her plan that the domestic tasks of the household should be so divided and arranged that each could perform a daily share without taking more time from study than was necessary to give healthful exercise. No sooner was this design announced than general attention to it was aroused. Many opposed; many also approved. Miss Lyon's patient and diligent elucidation of her design overcame objection. The money needed was given with enthusiasm. South Hadley, near Mt. Holyoke, was chosen as the site of the seminary. In 1837, buildings and necessary accommodations for 80 pupils being nearly completed, the school opened with more than that number. It was afterwards enlarged to receive 300 pupils. The remaining twelve years of Miss Lyon's life were devoted to this school. More than 60 of her pupils have engaged in missionary work among the women of heathen lands, and hundreds more have reflected Miss Lyon's example and influence, which they found in the schools. In all her schools together she taught 3,000 pupils. She wrote *Tendencies of the Principles Embraced and the System Adopted in the Mount Holyoke Female Seminary;* also, *The Missionary Offering. The Power of Christian Benevolence Illustrated in the Life and Labors of Mary Lyon* was compiled by Edward Hitchcock, D.D., LL.D., and published in 1851. An abridgment of this work was issued by the American tract society in 1858. Mary Lyon was the pioneer of the highest culture of American womanhood. Not beautiful in appearance, there was little that told of the energy, persistence, sagacity, and withal great tenderness and constant cheerfulness, combined with rare administrative talent, that sustained and carried through her great work. She planted the seed of which Vassar, Wellesley, Smith, and sister colleges are the fruits.

LYON, MATTHEW, 1746–1822; b. Wicklow co., Ireland; emigrated to New York in 1755; unable to pay for his passage he was committed by the captain, according to the custom of the time, to a farmer in Connecticut, with whom he served several years; subsequently removed to Vermont; became, 1775, lieut. in a company of "Green Mountain Boys;" was cashiered the latter part of the year for deserting his post; was in 1777 temporary paymaster of the northern army; subsequently commissary-general and col. of militia; founded the town of Fairfield, Vt., in 1783; built saw-mills and grist-mills, established a forge, made paper from basswood, established and edited a paper called *The Scourge of Aristocracy and Repository of Important Political Truth,* the types and paper of which were made by himself. He was ten years a member of the legislature, and in 1786 judge of Rutland co. court; became a zealous politician, and was elected to congress by the anti-federal party, 1797–1801; was convicted in 1798 of libel on president Adams, imprisoned four months in the Vergennes jail and fined $1000, which was paid by his friends. An attempt to expel him from congress as a convicted felon failed. While in congress he had a violent personal encounter with Roswell Griswold of Connecticut. After the expiration of his term as representative he removed in 1801 to Kentucky; was elected to the legislature, and to congress in 1803–11; built gunboats on speculation for the war of 1812, and became bankrupt; was appointed by president Monroe in 1820 U.S. factor for the Cherokee Indians in Arkansas, and elected territorial delegate to congress a short time before his death.

LYON, NATHANIEL, 1819–61; b. Conn.; a student at West Point, graduated in 1841. He continued in the army, and was employed in active service during the Mexican and Florida wars, and afterwards served in Kansas and on the frontier. Being in command of the U.S. arsenal at St. Louis in 1861, at the outbreak of the rebellion, he dispersed the secessionists collected by the governor, Jackson, and soon after attacked and defeated a rebel force at Boonesville, June 17, 1861. He was now made a brig.gen., and on Aug. 2 won another victory over a detachment of confederate troops at Dry Spring, near Springfield, Mo., and a week later fought the battle of Wilson's Creek, where he was shot and instantly killed. He won the first successes of the war, and his loss was greatly deplored by the army and by the northern people. He still further signalized his patriotism by bequeathing nearly his entire possessions, about $30,000, to the government, to be employed in forwarding the objects of the war. A collection of articles written for a Kansas newspaper in 1860 was published after his death under the title, *The Last Political Writings of Gen. Nathaniel Lyon.*

LYON COURT, one of the inferior courts of Scotland, having jurisdiction in questions regarding coat-armor and precedency, and also in certain matters connected with the executive part of the law. It is presided over by the Lyon king-of-arms (q.v.) or lord Lyon. Attached to the Lyon court are a certain number of heralds (q.v.) and pursuivants (q.v.) appointed by him, whose principal duty is now the execution of royal proclamations in Edinburgh, though the heralds were, in old times, to some extent associated with Lyon in the exercise of his jurisdiction. Lyon appoints the messengers-at-arms (officers who execute the process of the court of session), superintends them in the execution of their duty; and in the exercise of his judicial function, takes cognizance of complaints against them, and fines, suspends, or deprives them for malversation. It was formerly the practice for Lyon to appoint a deputy, who assisted him more or less in his judicial duties; but act 30 Vict. c. 17 has made it incompetent for him to do so in future. Among the officials of his court are the Lyon-clerk and keeper of records, formerly appointed by him, but in future to be appointed by the crown; the procurator-fiscal, or public prosecutor; a herald painter; and a messenger-at-arms, who acts as macer. The jurisdiction of the Lyon court is defined by two acts of the Scottish parliament, 1592, c. 127, and 1672, c. 21, and further regulated by 30 Vict. c. 17. The Scotch acts authorize the lord Lyon to inspect the ensigns armorial of all noblemen and gentlemen in Scotland, and oblige all persons who, by royal concession or otherwise, had previously a right to arms, to matriculate or register them in the Lyon's books. He is empowered to inquire into the relationship of younger branches of families having right to arms, and to "assign suitable differences to them, without which the arms cannot lawfully be borne." The later act establishes the now existing register of the Lyon court as the "true and unrepealable rule of all arms and bearings in Scotland," and authorizes the lord Lyon to "give arms to virtuous and well-deserving persons," not hitherto entitled to bear them. The unlawful bearing of arms subjects the delinquent to a fine, and confiscation of all the movable goods and gear on which the said arms are engraven or otherwise represented. Both acts are in full force: the differencing of cadets and granting of new coats are matters of daily practice in the Lyon office. On cause shown, Lyon also empowers applicants to alter or add to the coat to which they are already entitled, and sanctions the adoption of quarterings to indicate representation. He grants arms in conformity to stipulations in entails or other deeds of settlement, imposing on the heirs succeeding the condition of assuming a certain name and arms. When a change of surname is connected with a change of arms, it is the practice to grant an official recognition of the new surname along with the patent of arms, the certificate of which recognition serves the same purpose in the case of a Scotchman as the royal license does in the case of an Englishman, and is required by the war office and admiralty from officers in the army and navy. In his judicial capacity, Lyon investigates and decides in claims to particular coats of arms or armorial distinctions, his decision being subject to review in the court of session.

Right to bear arms is acquired either by descent or by grant. 1. In the former case, only the representative or head of the family can use the undifferenced coat; but a cadet, on presenting a petition to the lord Lyon, and establishing his relationship, has, by a matriculation, the family coat assigned to him, with such a difference as, according to the rules of heraldry, appropriately sets forth his relationship to the head of the family and to other cadets already matriculated. The mere fact of one's bearing the same surname with a family entitled to arms, confers no sort of right to wear these arms, differenced or undifferenced. 2. Where no hereditary right exists or can be proved, an original grant of arms may be bestowed by the lord Lyon. As in the case of a matriculation, a petition is presented to the Lyon court, which, in this case, need be accompanied with no evidence of pedigree; and in granting new coats, it is the duty of the Lyon to conform to the rules of good heraldry, and be observant of the rights of other parties. With these reservations, the wishes of the applicant are consulted as to the arms which he is to bear. The fees are now regulated by 30 Vict. c. 17, and amount to about £14 for a matriculation, where relationship is proved, and for an original grant, £42. An additional charge is made for supporters (q.v.), which are only given to those persons who are entitled to them by the heraldic practice of Scotland.

In strictness, the using of a crest on one's plate or seal without authority, is a transgression of the above-mentioned acts; but practically, prosecutions have generally been confined to cases of open and public assumption of a shield of arms. The offender is cited before the Lyon court by precept at the instance of the procurator-fiscal; the statutory fine and confiscation have occasionally been enforced, but they have oftener, particularly of late, been avoided by a timely submission. In this commercial country, there are not a few persons whose social status would entitle them to the use of arms, but who, not having inherited a coat, instead of acquiring the privilege in a legal way, have a sham coat invented for them by some coach-painter or "finder" of arms.

The register of genealogies is a department of the Lyon office unconnected with heraldry, where evidence is taken of the pedigree of applicants, irrespectively of noble or humble lineage, and recorded for preservation.

LYON KING-OF-ARMS, or LORD LYON, the title borne since the first half of the 15th c. by the chief heraldic officer for Scotland. He is the presiding judge in the Lyon court (q.v.), and appoints the heralds, pursuivants, and messengers-at-arms. Unlike the English kings-of-arms, he has always exercised jurisdiction independently of the constable and marshal, holding office directly from the sovereign by commission under the great seal. In Scotland he takes precedence "of all knights and gentlemen not being officers of state, or senators of the college of justice." In England he ranks after garter, and before the provincial kings-of-arms. Since the revival of the order of the thistle, he has been king-of-arms of that order. So sacred has his person been held that, in 1515, lord Drummond was declared guilty of treason, attainted, and imprisoned in Blackness castle, for striking Lyon. Prior to the revolution, Lyon was solemnly crowned at Holyrood on entering on office by the sovereign or his commissioner, his crown being of the form of the royal crown of Scotland, but enameled instead of being set with jewels. The crown is now only worn at coronations; and that actually supplied on occasion of the last four appointments has been similar to the crowns of the English king-of-arms. Lyon's badge or medal, suspended by a triple row of gold chains, or on common occasions by a broad green ribbon, exhibits the arms of Scotland, and on the reverse, St. Andrew on his cross; and his baton is of gold enameled green, powdered with the badges of the kingdom, and with gold ferrules at each end. Besides the velvet tabard of a king-of-arms, he has an embroidered crimson velvet robe; and as king-of-arms of the thistle, a blue satin mantle, lined with white, with a St. Andrew's cross on the left shoulder.

LYONNAIS, a former province of France, was bounded on the w. by Auvergne, and on the s. by Languedoc. Its territory coincides nearly with the present departments of Rhone, Loire, Haute-Loire, and Puy-de-Dôme.

LYONS, the second t. of France in respect of population, and the first with regard to manufactures, is the capital of the department of the Rhone, and stands at the confluence of the river of that name with the Saône, 316 m. by railway s.s.e. of Paris, 218 n.n.w. of Marseilles, and 100 w.s.w. of Geneva. It is situated partly on a low-lying peninsula between the two rivers, and partly on hills surrounding them, in a beautiful district covered with gardens, vineyards, and villas. It is the seat of an archbishop, and is the *chef-lieu* of the seventh military division. Many of the public buildings are interesting at once for their architecture, extent, and antiquity. Of these, the cathedral and church of St. Nizier, the hôtel-de-ville (town-hall), the finest edifice of the kind in the empire, the hospital, the public library with 150,000 volumes, and the palais des beaux arts, are perhaps the most notable among numerous and important institutions. There are also a university academy, an imperial veterinary school—the first founded in the country, and still the best—schools for agriculture, medicine, and the fine arts, etc. The printing trade is extensive in Lyons, and it has long been known for the vigor of its journals, such as the *Courrier de Lyon*. The two rivers are crossed by 19 bridges; 12 over the Saône, and 7 over the Rhone. The quays, 28 in number, are said to be the most remarkable in Europe. The principal are St. Clair, St. Antoine, and Orleans. There are several large and important suburbs—La Guillotière, Les Brotteaux, La Croix-Rousse, etc.; several fine squares, of which the *place Bellecour* is one of the largest in Europe. The fortifications extend in a circle of 13 m. round the city. From its situation on two great rivers, and on the Paris and Marseilles and other railways, Lyons has become the great warehouse of the s. of France and of Switzerland. The principa manufactures of Lyons are silk stuffs of all kinds, which have long been held in the highest esteem. An immense number of establishments, working 70,000 looms, giving employment directly or indirectly to 140,000 hands, are engaged in silk manufactures. Nets, cotton goods, blankets, hats, gold and silver lace, chemical products, drugs, liquors, earthenware, are also important articles of manufacture. The trade of Lyons is chiefly in its own manufactures and in the products of the vicinity; the arms and silk ribbons of St. Etienne, and the wines of Côte-Rôtie, Hermitage, and St. Peray. Pop. '76, 322,612.

LYONS, the ancient *Lugdunum*, was founded in the year 43 B.C. by Munatius Plancus. Under Augustus it became the capital of the province *Gallia Lugdunensis*, possessed a senate, a college of magistrates, and an atheneum, and became the center of the four

great roads that traversed Gaul. In 58 A.D., it was destroyed in one night by fire; but was built up again by Nero, and embellished by Trajan. In the 5th c., it was one of the principal towns of the kingdom of Burgundy; and in the 11th and 12th centuries, it had risen to great prosperity. To escape the domination of the lords and archbishops, the inhabitants placed themselves under the protection of Philippe-le-bel, who united the town to France in 1307. After the revolution (1789), Lyons, which had at first supported the movement with great enthusiasm, eventually became terrified at the acts of the central power, and withdrew from the revolutionary party. The result of this was, that the convention sent against Lyons an army of 60,000 men, and after a disastrous siege, the city was taken, and almost totally destroyed. It rose again, however, under the first Napoleon; and though, since then, it has frequently suffered much from inundations (1840 and 1856), and from the riots of operatives (1831 and 1834), it is now in a high state of prosperity.

LYONS, a city of Iowa, in the co. of Clinton, on the Mississippi river and the Midland and Dubuque railroad, and only 2 m. distant from the Northwestern, the Western Union, and a branch of the Chicago, Burlington and Quincy railroads; pop. 4,088. It is connected by a steam ferry with Fulton, Ill., and is traversed by a horse railroad. It has a paper-mill, saw-mills, sash factories, flouring-mills, machine-shops, carriage-shops, etc.; also 2 newspapers, 8 churches, a library, a seminary, and graded public schools. It is surrounded by a fine farming country.

LYONS, a t. in Wayne co., N. Y., on the N. Y. Central railroad and the Erie canal, nearly midway between Syracuse and Rochester; pop. '70, 5,115. The manufacture of oil of peppermint is an important industry, there being 20 peppermint distilleries, producing annually 100,000 lbs. of the oil. There are other manufactures; tobacco, grain, cider, and apples are among the productions.

LYONS, Edmund, Lord Lyons, 1790–1858; b. at Burton, Hampshire, England; a descendant of governor John Winthrop of Massachusetts; entered the British navy in childhood, and became a midshipman in 1803; served in the East Indies, becoming a commander in 1812, and a post-captain in 1814. In 1828 he was engaged in the blockade service at Navarino, Greece, then held by the Turks, and conveyed king Otho to Athens when the new kingdom was established; was knighted, and remained there as minister 14 years. In 1849 he became minister at Bern, and in 1851 at Stockholm. At the outbreak of the Crimean war he was appointed second in command of the Black sea squadron and commander-in-chief in 1854, and so distinguished himself by brilliant service that he was made a peer in 1856 under the title of baron Lyons of Christ church. Died at Arundel castle, Sussex.

LYONS, Richard Bickerton Pemell, D.C.L., Lord Lyons, b. England, 1817; educated at Winchester and Oxford, and entered the diplomatic service in 1839 as unpaid attaché at Athens. He was transferred to Dresden in 1852; to Florence, where he acted as secretary of legation, in 1853; and was made envoy to Tuscany in 1858. The same year he was sent as envoy extraordinary to the United States, and on his recall, at his own request, in 1865, he was made ambassador to Turkey, and in 1867 transferred to Paris, where he remains. In his successive important appointments he has proved himself an accomplished and skillful diplomatist.

LYONS, GULF of, in the Mediterranean, extending from the n.e. coast of Spain, on the w., to Toulon on the e., and receiving the Rhone, Hérault, Aude, and other rivers. It is subject to furious storms, and is said to have received its name, after the lion, on account of this circumstance. A portion of Catalonia, in Spain, and the departments in France of Pyrénées-Orientales, Aude, Hérault, Gard, Bouches-du-Rhone, and Var, lie on the coast of this gulf.

LYRA, Nicholas de, 1270–1340; b. Lyre, Normandy, France; studied in the Franciscan college at Verneuil, and at the university of Paris; became a doctor of divinity and eminent as a lecturer upon biblical interpretation. His thorough acquaintance with Hebrew led to the erroneous supposition that he was a Jew. He belonged to the Franciscan order, in which he held the most eminent positions, and his commentaries upon the Scriptures were in high repute among the reformers. His chief work, *Postillæ Perpetuæ in Universa Biblia*, in 5 vols. folio, is the only exegetical work of any value produced in the middle ages anterior to the revival of letters. The schoolmen of that day seldom understood Greek, never Hebrew, and therefore were poorly equipped as biblical commentators. He also wrote a work *On the Coming of the Messiah*, in reply to Jewish critics. Died in Paris.

LYRE, the oldest stringed instrument of the Egyptians and Greeks. There are many different kinds and sizes of the lyre, each having its own peculiar name, such as the lyre da Braccio, lyre da Gambe, lyre guitare, etc.

LYRE-BIRD, or Lyre-tail, *Menura*, a genus of birds, of which the best-known species (*M. superba*) is a native of New South Wales, where it is generally called the Lyre Pheasant. The proper place of this genus has been much disputed by ornithologists, some placing it among the *insessores*, near to thrushes and wrens, others among gallinaceous birds, with megapodes. The large feet and habit of scraping ally the lyre-bird with the latter; the form of the bill, the bristles at the base of the bill, and above all, its

musical powers, connect it with the former, to which it was unhesitatingly referred by Cuvier. It is a bird about the size of a pheasant, frequenting the *brush*, or sparsely-wooded country, in the unsettled parts of New South Wales, but retreating from the more inhabited districts. It is extremely shy and difficult to approach. It is by far the largest of all song-birds. It possesses the power of imitating the song of other birds. The tail of the male is very remarkable and splendid, the twelve feathers being very long, and having very fine and widely separated barbs; whilst, besides these, there are two long middle feathers, each of which has a vane only on one side, and two exterior feathers, curved like the sides of an ancient lyre. The lyre-bird makes a domed nest.—A second species (*M. Alberti*), also Australian, has recently been discovered, and has been named in honor of the late prince Albert. The lyre-shaped feathers of the tail are comparatively short.

LYRIC (from the Gr. *lyra*, a lyre), the name given to a certain species of poetry, because it was originally accompanied by the music of that instrument. Lyric poetry (see EPIC POETRY) concerns itself with the thoughts and emotions of the composer's own mind, and outward things are regarded chiefly as they affect him in any way. Hence it is characterized as *subjective*, in contradistinction to epic poetry, which is *objective*. Purely lyrical pieces are, from their nature, shorter than epics. They fall into several divisions, the most typical of which is the *song*, which is again subdivided into *sacred* (hymns) and *secular* (love-songs, war-songs, comic songs, etc.).

LYS, or LEYE, a tributary of the Scheldt, rises in France near the little town of Lysbourg, in the department of Pas-de-Calais, and flows in a n.e. direction, joining the Scheldt at Ghent in Belgium after a course of 100 miles. The Lys once formed the boundary between France and Germany.

LYSANDER, a famous Spartan warrior and naval commander, of extraordinary energy and military skill, but not less remarkable for the cunning, revenge, and ambition by which he was characterized. He spent part of his youth at the court of Cyrus the younger, and in 407 B.C. was appointed to the command of the Spartan fleet, from which time he constantly prosecuted the design of overthrowing the Athenian power, in order to exalt that of Sparta. He defeated the Athenian fleet at the promontory of Notion; and being again intrusted with the management of the fleet, after the defeat of his successor, Callicratidas (405 B.C.), he was again victorious. He swept the southern part of the Ægean, and made descents upon both the Grecian and the Asiatic coasts. He then sailed north to the Hellespont, and anchored at Lampsacus. An immense Athenian fleet soon made its appearance at Ægospotami, on the opposite side of the straits, amounting to 180 ships. Of these 171 were captured by Lysander a few days after. The blow to Athens was tremendous. Everywhere her colonial garrisons had to surrender, and Spartan influence predominated. Finally, in 404 B.C., he took Athens itself. His popularity now became so great, especially in the cities of Asia Minor, that the Spartan ephors dreaded the consequences, especially as they knew how ambitious he was. Every means was taken to thwart his designs, until finally it would appear that he had resolved to attempt the overthrow of the Spartan constitution; but this scheme was prevented by his death at the battle of Haliartus in the Bœotian war (395 B.C.).

LYSIAS, a Syrian nobleman, whom king Antiochus Epiphanes, setting out for Persia, appointed guardian of his son and regent of the kingdom, in which capacity he waged a formidable war with the Jews. His great army was defeated by Judas Maccabæus near Emmaus, 166 B.C. In the following year he was repulsed near Bethsura, but captured the fortress in 163 B.C., and besieged Jerusalem, but was compelled to withdraw by an insurrection at Antioch, shortly after which he was put to death by the populace of the latter city, who had rebelled in favor of Demetrius Sotes.

LYSIAS, b. Athens, B.C. 458. He was one of the ten Athenian orators, and the contemporary of the most distinguished men of Athens—Thucydides, Xenophon, Euripides, and Sophocles. His father was a man of wealth, was intimate with Pericles and Socrates, and his house was the scene of the celebrated dialogue of Plato's *Republic*. At the age of 15 Lysias went to Thurium, in the s. of Italy, with an Athenian colony, accompanied by the historians Herodotus and Thucydides, remaining there 32 years, and studying the art of eloquence under the two Syracusans, Tisias and Nisias. After the failure of the Athenian expedition in Sicily, he was obliged to leave Italy. Returning to Athens in 411, he carried on with his brother Polemarchus a large manufactory of shields, in which they employed 120 slaves. Athens fell into the hands of Lysander, and 30 tyrants were appointed to administer the affairs of the city. The wealth of the two brothers excited the cupidity of the tyrants; their house was attacked by an armed force while they were entertaining some friends at supper, their property seized, Polemarchus put to death, and Lysias, by bribing some of the soldiers, escaped to Megara. In his oration against Eratosthenes, one of the 30 tyrants, he has given a graphic sketch of his escape. At Megara he assisted Thrasybulus to free his country from the tyrants, supplying him with a large sum of money from his own resources, and hiring 300 men at his own expense. The tyrants having been expelled, Lysias returned to Athens in 403, where he began his career as an orator. Of the 475 orations ascribed to him, only 235 are regarded as genuine, and only 34 are extant. Dionysius of Halicarnassus, in

his critique of his works and style, says: "He was particularly distinguished for simplicity and precision, as well as for the fidelity with which he depicts the manners of the age." "In narrating events or circumstances," he considers Lysias "superior to all the orators." Quintillian compares him to "a clear and pure rivulet rather than to a majestic river." Cicero regards him as "the model of a perfect orator." The best editions of the orations of Lysias are those of J. Taylor (London, 1739), and of Reiske (Leipsic, 1722). Some of his orations have been translated into English by Dr. Gillies.

LYSIMACHIA, or LOOSESTRIFE, a genus of plants of the natural order *primulaceæ*, or primrose family, said to be named in honor of king Lysimachus (perhaps from λύσις, a release from, and μάχη, strife). Calyx, 5-parted (rarely 6 to 7); corolla, wheel-shaped, 5-parted (or 6 to 7), sometimes of as many separate petals; stamens of like number; pod globose, 5 to 10 valved. They are leafy stemmed perennials, generally with yellow flowers, axillary, or in a terminal raceme. Species grow in nearly all parts of the world, several in the United States, some being cultivated in gardens, as the MONEYWORT (*L. nummularia*), which was introduced from Europe. In this the leaves are roundish, small, with short petioles; peduncles axillary, one-flowered; ovate, acute sepals. It is a beautiful plant for hanging-baskets and for covering rocks, and also for carpeting beneath shrubs, forming, as it does, a thick mat. In some places it has escaped from the gardens into damp ground. It blooms from July to September. There are eight species enumerated by Gray as occurring in the United States: 1. *L. thyrsiflora,* or tufted loosestrife; stem from 1 to 2 ft. high, lower leaves reduced to scales, the rest lanceolate, the axils of one or two pairs of the middle ones bearing a short-peduncled spike-like cluster of yellow flowers; found in cold, wet swamps from Pennsylvania northwards; blooms in June and July. 2. *L. stricta:* leaves opposite or nearly alternate, lanceolate, acute at each end; flowers in a long raceme from 5 to 12 in., and leafy at the base; in variety producta, leafy for half the length; in low grounds, blooming from June to August. 3. *L. quadrifolia:* leaves whorled, in fours or fives, ovate-lanceolate; flowers on long capillary peduncles from the axils of the leaves; a common plant in the middle states, growing in moist or sandy soil, blooming in June. 4. *L. ciliata:* stem from 2 to 3 ft. high, leaves lanceolate-ovate, tapering to an acute point, on long and fringed leaf-stalks; common in low grounds and thickets; blooms in July. 5. *L. radicans:* stem slender, soon reclined, and often taking root from the joints; leaves ovate-lanceolate, borne on slender leaf-stalks; grows on swampy river banks in West Virginia and southward. 6. *L. lanceolata:* stem erect, 10 to 20 in. high; leaves lanceolate, oblong, and also linear, narrowing into the short petiole; growing on low grounds, westward and southward; blooming from June to August. 7. *L. longifolia:* stem erect, 4 angled, from 1 to 3 ft. high, often branched below; stem leaves sessile, linear, 2 to 4 in. long, smooth and shining, margins often revolute, veins obscure; corolla about ¾ of an inch in diameter, lobes pointed; grows in moist soil in western New York, Pennsylvania, to Wisconsin and Illinois; blooming from July to September. 8. *L. nummularia,* noticed above.

LYSIM'ACHUS, b. Pella, Macedonia, about 360 B.C.; a gen. of Alexander the great. He was a pupil of the philosopher Callisthenes, and was in his youth distinguished for bravery and physical strength. He was attacked by a lion in the forests of Syria, which he killed without assistance, from which probably originated the story told by Justin and Seneca of his being exposed to a furious lion and killing it by thrusting his cloak into its mouth. On the division of the empire at Alexander's death, 323, he received Thrace and the countries on the coast of the Euxine. He took possession of Thrace after conquering Seuthes, its king, and a powerful army. In B.C. 314 he joined the league formed against Antigonus by Ptolemy, Seleucus, and Cassander. In 306 he assumed the title of king. In 302 he was sent into Asia Minor to attack Antigonus, subduing on his way Phrygia, Lydia, and other places, taking possession of many strong fortresses in which Antigonus had collected immense treasure. On the approach of Antigonus he withdrew into Bithynia, where he was joined by Seleucus, and they, in 301, advanced against Antigonus and his son Demetrius. In the following year these two gens., aided by the forces of Ptolemy and Cassander, met Antigonus at Ipsus, where a fierce battle was fought; Antigonus was killed, and his dominions shared by the victors, Lysimachus obtaining the n.w. part of Asia Minor. In 292 he attacked Getæ, n. of the Danube, but was defeated, made prisoner, and released on giving his daughter in marriage to the king of the Getæ. In 288 he combined with Ptolemy, Seleucus, and Pyrrhus against Demetrius, who had invaded Thrace during his absence and captivity, drove him from Macedonia, became king thereof himself, and compelled Pyrrhus, who laid claims to the kingdom, to retire to his native dominions. The latter part of the life of Lysimachus was imbittered by domestic dissensions and intestine troubles. Having put to death his son Agathocles at the instigation of his wife, Arsinoe, the daughter of Ptolemy, king of Egypt, who feared that on the death of Lysimachus she and her children would be put to death by Agathocles, his subjects rose in rebellion, and Seleucus, at the entreaty of the widow of Agathocles, attacked Lysimachus, who was killed on the plain of Corus.

LYSIP'PUS, a celebrated Greek statuary; b. Sicyon, in the Peloponnesus; lived about 324 B.C. He was at first a workman in brass, then applied himself to the art of painting, and afterwards devoted himself to sculpture. He is said to have been self-

taught, and excelled in the study of nature rather than in copying the manner of any master. His peculiarity was that of making the head smaller and the body more slender and easy than his predecessors had done. His statues were admired for the beautiful manner of executing the hair. His contemporaries appreciated his talents; the different cities were eager to obtain his works; and Alexander, while he conferred on Apelles the sole right to paint his form, allowed no one but Lysippus to execute it in bronze. He is said by Pliny to have produced 1500 works of art. Among the most celebrated was a statue called "Apoxyomenos," representing a man scraping himself in a bath with a strigil, the removal of which, by order of Tiberius, from the baths of Agrippa to the palace of the emperor so excited the people that he was compelled to replace it. He made many statues of Alexander, representing him at different periods of his life, and in various positions; also, the equestrian statues of 25 Macedonians who fell at the passage of the Granicus, which Metellus transported to Rome. He executed a fine bronze statue of Cupid, with a bow; several statues of Jupiter, one of which, 60 ft. high, is at Tarentum; one of Hercules, which was removed to Rome; the Sun, drawn in a chariot by four horses; "Opportunity" (Kairos), represented as a youth with wings on his ankles on the point of flying from the earth. The sons of Lysippus, Dahippus, Bodas, and Euthycrates were his pupils; also, the renowned Chares, who executed the Colossus at Rhodes.

LYSONS, SAMUEL, 1763–1819; b. Rodmarton, England; educated for the bar, but relinquished the law for antiquarian pursuits; was made keeper of the records of the tower of London in 1803, and one of the directors of the society of antiquarians in 1812. He published, in 1797, *Roman Remains Discovered at Woodchester and Minchenhampton;* in 1801, his *Figures of Mosaic Pavements;* in 1802, his *Remains of Roman Antiquities at Bath;* in 1804, *Gloucester Antiquities.* He wrote also for the *Archæologia;* and assisted his brother Daniel in the preparation of the *Magna Britannia* in 1806–22.

LYSTRA, a city of Lycaonia in Asia Minor. It is worthy of note in sacred history as the place where Paul first had divine honors offered him and soon after was stoned; and also as being the native place of his companion and fellow-missionary, Timothy. It was in the eastern part of the great plain of Lycaonia. Its site is uncertain, but some have identified it with the ruins of Bin-Bir-Kilisseh, at the base of a volcanic conical mountain named the *Karadagh.*

LYTHRA'CEÆ, a natural order of exogenous plants, consisting of herbaceous plants, with a few shrubs; the branches frequentlyfour-cornered. The leaves are generally opposite, entire, and sessile. The flowers are solitary or clustered, regular or irregular, and either axillary, racemose, or spiked; the calyx tubular, the petals inserted into the calyx, very deciduous, sometimes wanting. The stamens are inserted into the tube of the calyx below the petals, sometimes equal to them in number, sometimes two or three times as many. The ovary is superior, generally 2 to 6 celled. The fruit is a membranous capsule with numerous seeds. There are about 300 known species, natives of tropical and temperate, or even of cold climates. Some of them are occasionally applied to medicinal uses, upon account of a stringent, narcotic, or febrifugal properties. Among those thus employed is the PURPLE LOOSESTRIFE (*lythrum salicaria*), a common British plant, growing in moist places and about the margins of ponds and streams, with beautiful leafy spikes of purple flowers; a decoction of either the root or the dried leaves of which is sometimes advantageously used in diarrhea. The henna (q.v.) of Egypt is produced by *Lawsonia inermis,* a plant of this order. The leaves of another (*pemphis acidula*) are said to be a common pot-herb on the coasts of the tropical parts of Asia. The leaves of *ammania vesicatoria,* an East Indian aquatic plant, are very acrid, and are sometimes used as blisters.

LYTHRUM (Gr. *λύθρον,* blood, from the crimson or purple color of the flowers), a genus of herbaceous plants, called also LOOSESTRIFE in common with lysimachia (q.v.), although belonging to another order, *lythraceæ.* Calyx cylindrical, striate, 5 to 7 toothed; petals, 5 to 7; stamens as many as the petals, or twice the number, inserted low down on the calyx; pod oblong, two-celled. The herb is slender, with opposite or scattered, mostly sessile leaves, and purple flowers. The *L. salicaria,* or spiked loosestrife, is a native of Europe, but is found in some of the older states in this country in wet meadows, particularly in New England and e. New York, where it is frequently cultivated; leaves lanceolate, heart-shaped at the base, sometimes whorled in threes; stamens 12, twice the number of petals, 6 longer and 6 shorter. It is a fine, tall, rather downy plant, with large flowers, from crimson to purple; perennial. By growing in dry places the plant becomes more downy and hoary, and considerably dwarfed. The herb has a mucilaginous, astringent taste. The blackish brown, branching, and fibrous root is also astringent, mucilage and tannin being its principal constituents. It has a place in pharmacopœias as a medicine, and is much used in Europe in diarrhea, dysentery, and passive hemorrhages. It is usually given in decoction made by boiling an ounce of the root in a pint of water, the dose being from one to two fluid ounces. The principal species indigenous to the United States are *L. hyssopifolia,* a low annual, from 6 to 10 in. high; leaves oblong-linear, obtuse, longer than the inconspicuous flowers; petals, pale purple, 5 to 6 in number; stamens the same; found in marshes on the coast of New England and New Jersey. *L. alatum*: tall and wand-like; perennial;

leaves from oblong-ovate to lanceolate; color deep purple; growing in Michigan, Wisconsin, and southward. *L. linearе*: stem slender and tall, from 3 to 4 ft., bushy at the top; leaves linear, short, chiefly opposite; petals whitish; grows in brackish marshes in New Jersey and southward.

LYTTELTON, EDWARD, D.C.L., Baron, 1589–1645; b. at Mounslow, Shropshire, England; graduated at Oxford in 1609; appointed chief-justice of North Wales in 1621; elected to parliament in 1626; recorder of London in 1631; made solicitor-general and knight in 1634; chief-justice of common pleas in 1640; lord keeper of the great seal in 1641; and a peer in the same year. In 1642 he escaped with the great seal to Charles I. at York; was required by parliament in 1643 to restore it on pain of losing his place; appointed first commissioner of the treasury in 1644. Died at Oxford.

LYTTELTON, THOMAS, Lord, b. Devonshire, England, in the 15th c.; studied at Cambridge and at the inner temple, where he was a lecturer on law; was appointed by Henry VI. steward of the court of the palace, and in 1455 the king's sergeant. He traveled through the northern circuit as judge of assize. The excellence of his character and his fame as a lawyer procured for him the favor both of the Lancastrians and Yorkists during their long struggle, and Edward IV. in 1462 offered him a general pardon, confirming to him also the offices of king's sergeant and judge of assize. In 1466 he appointed him one of the judges of common pleas, and made him a knight of the order of the bath. He was buried in Worcester cathedral, where a marble tomb, surmounted by a statue, was erected to his memory. His great work on *Tenures*, written in Norman French, composed while he was judge of common pleas, was printed after the author's death, and published in English in 1539. Sir Edward Coke wrote a commentary on it, now known by the title of *Coke upon Lyttelton*

LYTTLETON, GEORGE, Lord, son of sir Thomas Lyttleton of Hagley, in Worcestershire, was b. in 1708–9, and educated at Eton and Christ-church, Oxford. He entered parliament in 1730, held several high political offices, was raised to the peerage in 1759, and died in 1773. Lyttleton had once a considerable reputation as an author. His best known works are *Observations on the Conversion and Apostleship of St. Paul* (1747), *Dialogues of the Dead* (1760), and *History of Henry II.* (1764).—He had a son, THOMAS, Lord LYTTLETON, who died young, and who was as conspicuous for profligacy as his father for virtue.

LYTTON, Lord, better known as Sir EDWARD GEORGE EARLE LYTTON BULWER, Bart., the youngest son of gen. Bulwer of Woodalling and Haydon Hall, Norfolk, was b. in 1805, and received his education at Cambridge, where he graduated B.A. in 1826, and M.A. in 1835. He was distingished as a writer and as a politician, and his achievements in these diverse fields may be noticed separately.

His first publication was a poem on *Sculpture*, which gained the chancellor's prize for English versification at Cambridge in 1825. In 1826 he published a collection of miscellaneous verse, entitled *Weeds and Wild Flowers*, and in the year following a tale in verse with the title *O'Neill, or the Rebel.* In 1827 his first novel, *Falkland*, was published anonymously. Next year he published *Pelham*, which astonished the critics by its cynicism and its icy glitter of epigram. *The Disowned*, *Devereux*, and *Paul Clifford* followed in rapid succession. In 1831 he broke into more passionate and tragical regions in *Eugene Aram*, and after that ceased for a period to convulse the libraries. About this time he succeeded Campbell as editor of *The New Monthly Magazine*, and contributed to its pages a series of papers which were afterwards collected under the title of *The Student.* In 1833 he produced his *England and the English.* In 1834 he returned to fiction, and published in an illustrated form *The Pilgrims of the Rhine.* This was followed by *The Last Days of Pompeii*, a work of a higher class than any of his former productions. *Rienzi* followed in the same splendid vein, and received the same admiration. His next work was a play in five acts, *The Duchess of La Vallière*, which was put on the stage in 1836, and failed. *Ernest Maltravers* came the year after, which, as containing his views on art and life, has ever been a favorite with his more thoughtful readers. In the same year he published *Athens; its Rise and Fall*, full of research and splendid rhetoric. *Leila* and *Calderon* appeared in 1838. His next efforts were in the difficult walk of the drama, in which he had formerly failed. He produced *The Lady of Lyons* and *Richelieu*, both of which remain among the most popular of modern English plays.

Lytton's next important work was *Zanoni*, which was published in 1842, and in the same year appeared his poem entitled *Eva.* Other poems were issued—*The New Timon* in 1846, and *King Arthur* in 1848, the former containing couplets turned with the grace and art of Pope. His next novels were *The Last of the Barons*, *Harold*, and *Lucretia;* and thereafter he adopted a new walk of fiction, and achieved his greatest triumphs *The Caxtons*, a domestic novel, gave the world the crowning proof of Lytton's versatility. This work was followed by *My Novel*, one of his finest productions. After that he published *What will he do with it?* and a clever poem entitled *St. Stephen's.* In 1861 *A Strange Story* appeared in *All the Year Round;* and in 1863 he contributed to *Blackwood* a series of essays under the title of *Caxtoniana*, which were republished in two vols the same year. *The Lost Tale of Miletus* was published in 1866; and a translation of *Horace's Odes* three years later, as also *Walpole*, a comedy. Inaugural addresses o

his as lord rector of Edinburgh and Glasgow (he was elected to this high office twice in Glasgow) universities, respectively, have been published. Lytton contributed, besides, many valuable critical articles to the *Quarterly*, *Edinburgh*, and *Westminster Reviews*. *The Reign of Terror*, which appeared in the *Foreign Quarterly Review*, is a remarkable treatise. His latest works of artistic fiction were *The Coming Race*, published anonymously in 1871; *Kenelm Chillingly*, 1873; and *The Parisians*, which appeared originally in *Blackwood's Magazine* in 1873. These publications show that, to the end, the natural force of his genius had not abated. A collection of his *Speeches* appeared in 1874.

At the age of 26 Lytton entered parliament as member for St. Ives, and attached himself to the reform party. In 1832 he was returned as member for Lincoln, and held that seat till 1841. In 1835 he received his baronetcy from the Melbourne administration ostensibly for brilliant services rendered to his party as a pamphleteer. In 1844 he succeeded, on the death of his mother, to the Knebworth estates, and sought to return to parliament; in 1847 he contested Lincoln unsuccessfully; and in 1852 he was returned as member for the county of Herts, and attached himself to the party headed by lord Derby. During the Derby administration (1858–59) he was colonial secretary. He did not shine as a debater, but several of his parliamentary speeches were eloquent and telling. He died in 1873.

LYTTON, EDWARD ROBERT BULWER-LYTTON, Lord. See BULWER-LYTTON, EDWARD ROBERT, Earl.

M

M, THE thirteenth letter of the English alphabet, is the labial letter of the class of liquids. See LETTERS. Its Hebrew name is *Mem*, i.e., "water," and its original form was probably a waving line representing water. M is liable to many changes, and often disappears altogether. The Greek *molubdos* corresponds to Lat. *plumbum;* an old form of Lat. *bonus*, *benus*, or *belus*, was *manus*, which probably accounts for the comparative *melior*. See B. Final *m*, in Latin, was pronounced with such a weak, undecided sound that it was proposed to write it with half the letter; hence also, before the spelling of the language had become fixed, it had in many cases been altogether dropped, as in *lego* for *legom*. See INFLECTION. The nasal sound in final *m* in French seems to be a relic of the Roman pronunciation.

M OR N, in Catechisms. M is a contraction of N N (names); N is for name: the respondent is required to give his *names*, if he has more than one, or his name, if only one. In the marriage service, M stands for *mas* (the man), or *maritus* (the bridegroom); and N. for *nupta* (the bride). Some think that M stands for *Mary*, the patron saint for females, and N for *Nicholas*, the patron saint for men.

MAAS (Lat. *Mosa*, Fr. *Meuse*), a large affluent of the Rhine, rises in France, in the department of Haute-Marne, near the village of Meuse, flows in a northerly direction through France, Belgium, and Limburg, and then eastward through Holland to the German ocean From its junction with the Waal, a branch of the Rhine, to the mouth of the Yssel, it is called the Mervede. At Dordrecht, it divides into two branches, inclosing the island of Ysselmonde—of these, the northern is called the Nieuwe Maas (New Maas), the southern the Oude Maas (Old Maas). These branches unite on the eastern side of the island of Rozenburg, after which the river falls into the North sea, in long. 4° 5′ east. Its entire course is 500 m. in length, for 360 m. of which (from Verdun, in the department of Vosges, France, to the mouth of the river) it is navigable. The area drained by the Maas is estimated at 19,000 sq. miles. Its principal affluents are the Sambre and the Dieze, on the left; and the Ourthe, the Roer, and the Niers, on the right. Of the important towns on the banks of the Maas, the principal are Namur, Liége, Maastricht, Gorkum, Dort, and Rotterdam.

MAAS'TRICHT, or MAESTRICHT (called by the Romans *Trajectum ad Mosam*, to distinguish it from *Trajectum ad Rhenum*, now Utrecht), is a very old and important fortified town, capital of the province of Limburg, kingdom of the Netherlands. Pop. '74, 28,650. Maastricht is on the left bank of the river Maas, which separates it from the town of Wijk, the connection being maintained by a stone bridge, 500 ft. in length, resting on nine arches, and defended by small fortified islands. The town was founded in the 5th c., the seat of the bishop being transferred thither after Attila had plundered Tongres, in 451. It is 15 m. n. of Liége, 18 w. of Aix-la-Chapelle (Aken), and pleasantly situated in a hilly district. The streets are broad, and the houses regularly and well built, giving an air of beauty and respectability to the town. There are many paintings and a select public library in the town-house, a large square stone building, ornamented with a tower, and standing on the great market. Maastricht has one Lutheran, one Dutch Reformed, one French Reformed, and four Roman Catholic churches; also a Jewish synagogue; three hospitals, two orphan-houses, an athenæum, and other public buildings. The plains are shaded with trees and refreshed by fountains. There is railway communication with all parts of the Netherlands, Germany, Belgium, and other

countries of the continent. Maastricht has a very considerable trade with Bois-le-duc and other places. Leather, woolen stuffs, stockings, blankets, flannels, starch, madder, pins, etc., are manufactured; soap-boiling, gin-distilling, brewing, sugar-refining, and iron-founding add to the prosperity of the town.

Maastricht has often felt the scourge of war, and the evils incident to a frontier fortified town. It is surrounded by broad and deep canals, which contribute to its defensive strength. It is commanded by the hill of St. Pierre, formerly called *Mons Hunnorum*, a soft, calcareous mountain, which has been very extensively mined, forming a cavernous labyrinth of several leagues in length. Among other fossils, have been found in these workings two heads of the gigantic mosasaurus.

MAB, in northern mythology, the queen of the fairies; though some authorities have it that queen, in this use, should be *quean*, signifying female, as adapted from the Saxon *cwe'n*. In opposition to this is the Welsh meaning of the word, "a boy," but the frequent use of it by poets in its significance of fairy-queen has caused it to be popularly accepted in that sense. The speciality of Mab, as attributed in English poetry, is to act as the "fairies' midwife," who delivers the brain of dreams. Thus when Romeo says: "I dreamed a dream to-night," Mercutio replies, "O then, I see queen Mab hath been with you." Mab appears in the poems of Ben Jonson, Herrick, and Drayton: Shakespeare's description of her, placed in the mouth of Mercutio, is well known:

> She is the fairies' midwife, and she comes
> In shape no bigger than an agate-stone
> On the fore-finger of an alderman,
> Drawn with a team of little atomies
> Athwart men's noses as they lie asleep, etc.
>
> —*Romeo and Juliet*, Act I., Sc. IV.

MABILLE, or JARDIN MABILLE, a place in Paris famous for brilliant public balls held nightly, which are frequented by the gay, rollicking youth of all countries, and by travelers drawn thither by curiosity, in numbers almost equal to those of Parisian visitors. Fantastic revelry, marvelous dancing, intoxicating music are the attractions in the midst of a panorama made gorgeous by the blaze of 3,000 gas jets shaded into all colors to light the ball-room, the passages, the alcoves, and the groves of this fairy garden of men, women, and flowers. The garden, established in 1840, is on the s. side of the Champs Elysée. That part of the garden which is under roof, and that which has only the boughs of trees and the sky above it are so blended that one hardly notices whether he is under one or the other. Formerly youth who went for their own pleasure were the main performers in the grotesque extravagances of the dancing. Of late years, however, professional *dansantes* are employed to astonish visitors, by whom they can be distinguished from other revelers only by the extraordinary fantasies of their performances. One of their characteristic feats is to lift a toe suddenly to the head of a dancer or astonished visitor who presses too near the dancing circle, to dash a hat from his head without touching his face or arresting their own swift course in the dance. The visitors to the Mabille are from every part of the world. Middle-aged, portly Englishmen, Americans, Turks, Arabs, Russians, and even their ladies are seen in the throng around the dancers, and go prepared to be trifled with. France furnishes the larger part of the men who enter frankly into the hilarity of the dancing scenes and all of the peculiarly supple, fascinating, and soiled women. Though physical exuberance of joy and fuss is allowed the widest license in the dance, vulgarity of language is very rare, and when exhibited results in quick expulsion of the offender. It is thought that the resort is not so largely attended or in so good repute as formerly with English and American travelers of the cultivated classes; and it would seem that a proper taste—not to speak of decency—might operate against its peculiar style of attraction.

MABILLON, JEAN, a learned Benedictine, b. Nov. 23, 1632, at St. Pierremont, in Champagne. He studied at the collége de Reims; assisted D. Luc d'Achery in his labors upon his vast historic *recueil*, entitled *Spicelegium;* undertook an edition of the works of St. Bernard; and in 1668, published the first volume of the *Acta Sanctorum Ordinis S. Benedicti*, of which the last part appeared in 1702. His classical work *De Re Diplomaticâ* appeared at Paris in 1681. Colbert offered him a pension of 2,000 livres, but he declined it. In 1683 Colbert sent him to Germany, to collect documents relative to the history of France, and he was afterwards sent to Italy for a similar purpose. He died in Paris, Dec. 27, 1707. His *Vetera Analecta* (4 vols. Par. 1675–85), and *Musæum Italicum, seu Collectio Veterum Scriptorum ex Bibliothecis Italicis eruta* (2 vols. Par. 1687–89), contain part of the fruits of his laborious and erudite researches.

MABLY, GABRIEL BONNOT DE, 1709–85, b. France; educated for the priesthood among the Jesuits of Lyons, and novitiated in the seminary of St. Sulpice, Paris. He resigned the priestly calling, and attracting the attention of cardinal De Tensin by the solidity of his conversation on state affairs, was attached to the bureau of the minister of foreign affairs, and became a power among the ministers. After acquiring high position he broke with his patron the cardinal, because the former resolved to pronounce Protestant marriages null. Living in retirement he became author of works calling attention to the noble thoughts of Greek and Roman authors, and to their wisdom in government. He looked backward and not forward for his ideals, and failed to per-

ceive progressive development in modern civilization. In 1784, in a publication entitled *Observations sur le gouvernement et les lois des Etats Unis d'Amerique*, he predicted the early downfall of the United States, if they continued in the mercantile road. In his old age he saw nothing that gave him encouragement that the world was not going to the bad, and obtained the surname of "Prophet of Evil." His early writings, after his retirement, are remarkable for the clearness with which they depict the danger of character which comes to nations with increase of wealth and luxuries, and show that commerce and the arts serve but to corrupt peoples without adding to their real happiness. Sparta with the Jesuit college grafted on it, was his ideal community. Mably's writings were the source of many of the most radical and one-sided hobbies of French socialists and agrarians; and while he intended them to fortify respect for the more ancient forms of social life, they became the seed of the wildest democratic vagaries. He demanded the abolition of individual property, of the laws of inheritance, the suppression of commerce, of education, of amusements. Agriculture and the gymnasium as in Sparta, a state religion tolerating no other—these were the ends of his philosophy. "It is better" he writes, "that there should be but a million happy men upon all the earth, than the innumerable multitude of *miserables* and slaves who live a half-life in the midst of misfortunes." Such crude and half-sided philosophy formed the school in which Marat, St. Just, and Babeuf found apology for their fanaticism.

MABUSE, JAN DE (GOSSAERT), 1499–1562; a Flemish painter who executed pictures of the three children of Henry VII. of England, also "Adam and Eve," "Christ and the Rich Young Man," which are in the Kensington gallery. After visiting Italy in 1532–33, he returned to Germany where his works are numerous and valued to this day. "Neptune and Amphytrion," in the museum of Berlin is one of his best. The Louvre has a great number of his pictures of religious subjects.

MAC, or **M'**, a Gaelic prefix occurring frequently in Scottish names, means "son," and is probably allied to the Gothic *magus*, a son, a boy, the feminine of which is *magaths* (Ger. *magd*, a maid). The root is probably the Sanskrit *mah*, to grow (see G). In Welsh, *magu* means to breed. The Welsh form of *Mac* is *Map*, shortened into *'ap* or *'p*, as Ap Richard, whence Prichard.

MACADAM, JOHN LOUDON, was b. in Scotland in 1756, and passed his youth in the United States. On his return, he was appointed manager of a district of roads in Ayrshire, and originated and successfully practiced the system of road-making now known by his name. In 1819, he was summoned to England, and was appointed by parliament to superintend the roads in the Bristol district, which were in a most deplorable condition. In 1827 he was appointed general surveyor of the metropolitan roads; and in reward of his exertions to render them efficient, received a grant of £10,000 from government. His system rapidly became general throughout England, and was also introduced into France with great success. Macadam died at Moffat, in Dumfriesshire, in 1836. The principles of his system, which is known as *Macadamizing*, are as follow: "For the foundation of a road, it is not necessary to lay a substratum of large stones, pavement, etc., as it is a matter of indifference whether the substratum be hard or soft; and if any preference is due, it is to the latter. The metal for roads must consist of *broken stones* (granite, flint, or whinstone is by far the best); these must in no case exceed 6 oz. each in weight, and stones of from 1 to 2 oz. are to be preferred. The large stones in the road are to be loosened, and removed to the side, where they are to be broken into pieces of the regulation weight; and the road is then to be smoothed with a rake, so that the earth may settle down into the holes from which the large stones were removed. The broken metal is then to be carefully spread over it; and as this operation is of great importance to the future quality of the road, the metal is not to be *laid* on in shovelfuls to the requisite depth, but to be *scattered* in shovelful after shovelful, till a depth of from 6 to 10 in., according to the quality of the road, has been obtained. The road is to have a fall from the middle to the sides of about 1 ft. in 60, and ditches are to be dug on the field-side of the fences to a depth of a few inches below the level of the road." This system, which at one time threatened to supersede every other, is calculated to form a hard and impermeable crust on the surface, thus protecting the soft earth below from the action of water, and so preventing it from working up through the metal in the form of mud. Strange to say, it has succeeded admirably in cases where a road had to be constructed over a bog or morass, but in some other circumstances, it has been found deficient. See ROADS.

McALLISTER, FORT, a strong earthwork, erected by the confederates during the war of the rebellion on Genesis point, on the right bank of the Great Ogeechee river, 6 m. from Ossabaw sound, and 12 m. s. of Savannah, Ga. It successfully resisted the fleet of monitors under commodore Worden in 1863, but was taken by assault by the 2d division of the 15th corps under gen. Hazen, Dec. 13, 1864, with a loss of 90 men. This was the closing feat of Sherman's "march to the sea," and led to the surrender of Savannah a few days later.

McALPINE, WILLIAM J.; b. New York, 1812; after completing his classical education, he began engineering in 1827, under John B. Jervis, with whom he remained 12 years, during which time he was employed upon the Delaware and Hudson canal and

railroad, and upon other public works, under the direction of his chief. He was the successor of Mr. Jervis as engineer of the eastern division of the Erie canal enlargement until 1846, when he was chosen to construct the dry-dock at the Brooklyn navy-yard. In 1852 he was elected state engineer of New York. In 1854–56 he was railroad commissioner of the state, in which capacity he made a valuable report upon the principles and practice of railroad construction and management. Afterwards, for two years, he was engineeer and acting president of the Erie railroad, later still, engineer of the Galena and Chicago, and of the Ohio and Mississippi railroads. He constructed the water-works of Chicago and Albany, and planned those for Brooklyn and New Bedford. In 1870 he presented plans, which were accepted by the Austrian government, for the improvement of the cataracts of the Danube.

MACAO', a Portuguese settlement on the coast of China, in lat. 22° 11′ n., and long. 113° 33′ e., on the western part of the estuary of the Canton or Pearl river, Hong-Kong being about 40 m. distant, on the opposite side of the same estuary. The settlement, which is about 8 m, in circuit, is on a small peninsula, projecting from the south-eastern extremity of the large island of Hiang-shan. Its position is very agreeable, nearly surrounded with water, and open on every side to the sea-breezes, with a good variety of hill and plain. The town is slightly defended by some forts. Daily steam communication is maintained with Hong-Kong. The principal public buildings are the cathedral and churches. It is one of the most salubrious ports in China, with full exposure to the s.w. monsoon, and recent sanitary improvements have added greatly to its healthiness. The maximum temperature is about 90°, the minimum about 43°. The population is about 80,000, 10,000 of whom are Portuguese and other foreigners. The Portuguese obtained permission from the Chinese authorities in 1557 to settle in Macao on account of the assistance they gave in hunting down a pirate-chief whose head-quarters were in this island. The Chinese, however, held, until recently, a lien upon the place, requiring of the Portuguese 500 taels ground-rent, retaining also jurisdiction over their own people. The privileges obtained by England through the treaty of Nankin were subsequently extended to the Portuguese, who, by successive aggressions, have become wholly independent of the Chinese. The anchorage at Macao is defective. The Typa anchorage lies about 3 m. off the southern end of the peninsula; but large vessels cannot approach nearer the shore than 6 miles. After the rise of Hong-Kong, the commerce of Macao almost entirely disappeared. Some years ago a suspicious trade in coolies sprung up; but in 1873 the British government forbade ships carrying on this traffic to enter any of the treaty-ports, and on Dec. 20 of that year the Portuguese government abolished the trade. Here Camoens, in exile, composed his *Lusiad*.

MACAPÁ, a t. in Brazil, on the Amazon, 130 m. from its mouth; pop. 7,500. It is a fortified town, the harbor and river being defended by a fort overlooking them. The town is well built and regularly laid out; public buildings are a town-hall, church, school-house, prison, and hospital. There is a good export trade in cacao, tropical fruits, millet, rice, cotton, and fine woods.

MACAQUE', quadrumana belonging to the family simidæ, and to that section denominated by Bowen catarrhine, or the old-world monkeys. They constitute the genus *macacus* of which there are several species. There has been some confusion in the classification of these animals. The name first appears in Marcgrave's *Natural History of Brazil*, as the name of a monkey of Congo and the coasts of Guinea. The application of the title to an Asiatic species of an entirely different genus was an error of Buffon's—perhaps unavoidable when made by him. Lacépède latinized the word macaque (or macaco), the native title, and applied it to the genus. There are also different statements made as regards the habitat of the apes to which the term is now applied, for it is often stated that the macaques are natives of Africa as well as of Asia and Gibraltar, whereas Mivart, in his little book *Man and Apes*, distinctly states that "the macaci, or macaques, are not found in Africa, but they extend farther north than any other of the monkeys." Two species, he says, are found in Japan and at Gibraltar, called respectively *M. speciosus*, and *M. inuus*. An Indian macaque, called the rhesus, inhabits many parts of Hindustan in great numbers. (See RHESUS MONKEY, *ante*.) The wanderoo, or *M. silenus* of the Indian archipelago, is another macaque (see WANDEROO, *ante*). The *M. inuus*, the Gibraltar monkey, is regarded by some as a distinct genus from the Japan ape, and is called *inuus sylvanus*, or the Barbary ape (q.v.). The following species of *macacus* are given in the British museum catalogue: *M. radiatus*, the zati, or capped macaque, sometimes called the toque; *M. sinicus*, the munga, or bonnet macaque; *M. nemestrinus*, the bruh; *M. cynomolgus*, the macaque; *M. rhesus*, the rhesus; *M. oinops*, the oinops; *M. speciosus*, the Japan ape; *M. juncus*, the magot, and *M. niger*. The macaques have cheek pouches and large ischial callosities; the length of tail also varies in different species, being rudimentary in some and long in others. Many of the monkeys seen in menageries are macaques. When young they are docile and active, but as they grow old they become morose and exhibit some of the ferocity of their cousins the baboons. See QUADRUMANA.

MACARO'NI (originally lumps of paste and cheese squeezed up into balls; from It. *maccare*, to bruise or crush), a peculiar manufacture of wheat, which for a long time was peculiar to Italy, and, in fact, almost to Genoa; it is now, however, made all over

Italy, and at Marseilles and other places in the south of France. Strictly speaking, the name macaroni applies only to wheaten paste in the form of pipes, varying in diameter from an ordinary quill up to those now made of the diameter of an inch; but there is no real difference between it and the fine thread-like vermicelli, and the infinite variety of curious and elegant little forms which, under the name of *Italian pastes*, are used for soups.

Only certain kinds of wheat are applicable to this manufacture, and these are the hard sorts, which contain a large percentage of gluten. At present, the Italian manufacturers prefer the wheats of Odessa and Taganrog; but they also employ those of their own country grown in Sicily and in Apulia. The wheat is first ground into a coarse meal, from which the bran is removed—in that state it is called *semola* (see also SEMOLINA); during the grinding, it is necessary to employ both heat and humidity, to insure a good semola. The semola is worked up into a dough with water; and for macaroni and vermicelli it is forced through gauges, with or without mandrels, as in wire and pipedrawing; or for *pastes*, it is rolled out into very thin sheets, from which are stamped out the various forms of stars, rings, etc.

The manufacture of this material is of great importance to Italy, where it forms a large article of home consumption, and is exported to all parts of the world. In Genoa alone nearly 170,000 quintals of wheat are annually consumed in this manufacture. The finest qualities of macaroni are those which are whitest in color, and do not burst or break up in boiling; it should swell considerably, and become quite soft; but if it does not retain its form when boiled, it has not been made of the best wheat. Some makers flavor and color it with saffron and turmeric, to suit certain tastes, but this is limited to very few. The use of macaroni and its varieties is rapidly increasing in Great Britain, where it is employed in soups, in puddings, and for making the favorite dish of macaroni and cheese.

MACARONIC VERSE is properly a kind of humorous poetry, in which, along with Latin, words of other languages are introduced with Latin inflections and construction; but the name is sometimes applied to verses which are merely a mixture of Latin and the unadulterated vernacular of the author, of which a very clever specimen are the lines of Porson on the threatened invasion of England by Bonaparte, entitled *Lingo drawn for the Militia* (see Wheatley's *Anagrams*, etc.). Teofilo Folengo, called Merlino Coccajo, a learned and witty Benedictine, who was born at Mantua in 1484, and died in 1544, has been erroneously regarded as the inventor of macaronic poetry; but he was the first to employ the term, selected with reference to the mixture of ingredients in the dish called macaroni. His *Maccaronea* (Tusculanum, 1521, and many editions) is a long satiric poem, in which Latin and Italian are mingled. Fortunately, macaronic poetry has not been very extensively cultivated, although specimens of it may be found in the literature of almost all European countries. The idea of it was probably first suggested by the barbarous monkish Latin. There is a history of macaronic poetry, and a collection of the principal works of this kind by Genthe (Halle, 1829). Compare also Octave Delepierre's *Macaroneana*, Paris, 1852), and his *De la Littérature Macaronique et de quelques Raretés Bibliographiques de ce Genre* (vol. ii., *Miscellanies of Philobiblon Society*, Paris, 1856).

MACAROON (from the same root as macaroni), a favorite kind of biscuit, made with the meal of sweet almonds, instead of wheaten or other flour. The most esteemed formula for making macaroons is either prepared almond-meal dry, or, what is still better, almonds just blanched and beaten into a paste, one pound, thoroughly incorporated with a pound and a half of refined sugar in powder, an ounce of the yellow part of fresh lemon-peel grated fine, and the whites of six eggs. When thoroughly mixed, the paste is made into the shape of small oval biscuits, and placed on sheets of wafer-paper, and baked; afterwards, the superflous wafer-paper is trimmed off, and the macaroons are ready for use.

MACARSCA, or MARKASKA, a t. of the Austrian empire, in Dalmatia, on a small bay of the Adriatic, near the mouth of the Narenta, and 34 m. s.e. from Spalatro. The plague carried off half the inhabitants in 1815 and 1816, and the place has not yet completely recovered its prosperity. It carries on some trade, but the greater number of the inhabitants are employed in agriculture and fishing. Pop. 7,386.

MCARTHUR, DUNCAN, 1772–1839, b. N. Y.; his family removed to Pennsylvania in 1780, and in 1790 he served as a volunteer in Harmar's campaign against the Indians, and in later campaigns on the frontier. In 1805 he was elected a member of the legislature of Ohio, where he had settled and become a great landed proprietor. He entered the war of 1812 as colonel of an Ohio volunteer regiment, was promoted to a brig.-generalship in 1813, and the next year succeeded gen. Harrison as commander of the army of the west. He was a member of the Ohio legislature 1815–21, and a member of congress 1823–29. From 1830 to 1832 he was governor of Ohio.

MCARTHUR, JOHN, 1766–1834, b. England; a captain in the British army. While in the service in Australia in 1790, he secured a tract of land in the neighborhood of Sydney, and turned his attention to the development of the wool industry, making importations of sheep from Africa and Europe. His efforts attracted the attention of

the home government, which made him a grant of 10,000 acres of land; and he was the first to cultivate the ordinary vegetable crops on any large scale in Australia.

MACARTNEY, GEORGE, Earl, 1737–1806; b. Lissanoure, near Belfast, Ireland; graduated at Trinity college, Dublin, 1757; studied law in London; then made the tour of Europe, and on his return in 1764 was appointed envoy extraordinary to the empress of Russia, to conclude a commercial treaty with that country, which after some difficulty he accomplished. Returning in 1767 and sitting for a time in the British parliament, he became in 1769 chief secretary for Ireland. Retiring from this office in 1772 he was created knight of the bath. Appointed governor of the island of Grenada in 1775, he was taken prisoner on the capture of that island by the French in 1779, but was soon released by Louis XVI., and allowed to return to England. In 1776 he was raised to the Irish peerage by the title of baron Macartney. In 1780 he was appointed governor of Madras, but resigned in 1786 on account of ill-health, and for the same reason declined the appointment of governor-general of India. Soon after his return home he was wounded in a duel with maj.gen. Stuart, an officer whom he had found it necessary to remove from the service when in India. In 1788 he took his seat for the first time in the Irish house of peers, and in 1792 was made an Irish viscount, and sent ambassador extraordinary to Pekin, the first British envoy sent to China. In 1794 he was made earl Macartney in the Irish peerage, and returned from China the same year. In 1795 he was sent on a confidential mission to Italy. In 1796 he was made a British peer by the title of baron Macartney, and appointed governor of the newly captured territory at the cape of Good Hope. In 1798 he resigned on account of declining health, and for the same cause declined the offer of a seat in the cabinet of the Addington ministry in 1801. An account of his public life, with a selection from his unpublished writings, was published by his private secretary, sir John Barrow, in 2 vols. Sir George Staunton, his secretary to China, wrote an account of his Chinese embassy in 2 volumes.

MACARTNEY COCK, *Euplocomus ignitus*, a splendid gallinaceous bird, also called the FIRE-BACKED PHEASANT, a native of Sumatra and other islands of the same part of the world. It was first described in the account of lord Macartney's embassy to China. The entire length of the adult male is about two feet. The sides of the head are covered with a bluish-purple skin. The crown of the head has an upright crest of feathers with naked shaft, and a number of slender spreading barbs at the tip. The tail, when depressed, is forked; when erect, it is slightly folded, as in the common fowl. The general color is a deep black, with blue metallic reflections; the middle of the back, brilliant orange; the tail, bluish green, orange, and white. The female is smaller, and almost entirely of a rich brown color. The head is not crested, as in the male, but the hind feathers are lengthened.—The genus *euplocomus* is allied both to *gallus* (fowl) and *phasianus* (pheasant), and perhaps still more nearly to *lophophorus* (impeyan). Two or three splendid East Indian species are referred to it.

MACASSAR, the most southern portion of Celebes (q.v.), lies in lat. 4° 35′ to 5° 50′ s., and long. 119° 25′ to 120° 30′ e.; it is traversed by a lofty chain of mountains. Macassar was formerly the greatest naval power among the Malay states, but is now divided into the Dutch possessions and Macassar proper, which is of little importance, and governed by a native king, who pays tribute to the Netherlanders. The natives are among the most civilized and enterprising, but also the most greedy, of the Malay race. They carry on a considerable trade in tortoise-shell and edible nests, grow abundance of rice, and raise great numbers of horses, cattle, sheep, and goats; fishing is also extensively carried on. The Macassars are chiefly Mohammedans; the mosques are built of palm-wood. They are warlike, spirited, and impatient of a blow—their laws allowing them to avenge it by the death of the offender, if within three days.

MACASSAR, the chief town, is the residence of the Dutch governor and officials. It is situated on the strait of Macassar, which separates Celebes from Borneo, in 5° 10′ s. lat., and 119° 20′ e. long.; and is built upon a high point of land, watered by two rivers and smaller streams, surrounded by a stone-wall, and further defended by palisades and fort Rotterdam. Pop. about 20,000. The harbor is safe and convenient, but difficult to enter. Climate healthy, and all kinds of provisions plentiful. The exports consist of the various products of Celebes, which are brought from the settlements to Macassar for shipment. The chief of these are rice, sandal-wood, ebony, tortoise-shell, gold, spices, coffee, sugar, wax, cocoa-nuts, tobacco, opium, salt, edible nests, etc. The imports from China are principally silk fabrics and porcelain; from the Netherlands, cotton and linen goods, fire-arms, opium, spirits, etc. A very large proportian of the export and import trade is carried on between Macassar and the free port of Singapore, about a third part being with Java. The annual imports amount to about £400,000, and the exports to the same value sterling. No import or export duties are charged.

The Portuguese first formed a settlement in Macassar, but were supplanted by the Dutch, who, after many contests with the natives, gradually attained to supreme power. In 1811 Macassar fell into the hands of the British, who, in 1814, defeated the king of Boni, and compelled him to give up the regalia of Macassar. In 1816 it was restored to the Dutch, and continues to enjoy a fair share of the mercantile prosperity of the Netherlands' possessions in the eastern archipelago.

MACASSAR OIL—so called from the district of Macassar, in the island of Celebes, whence it is exported—is a species of vegetable butter, of an ashen-gray color, and rancid odor.—This name has also been given in Britain to a patent preparation used for promoting the growth of the hair and preventing its decay. It is composed of olive oil, or oil of almonds, colored with Alkanet root, and mixed with perfumes.

MACAS'SAR, STRAIT OF, a body of water which separates the islands of Borneo and Celebes, and unites the Java sea with the sea of Celebes. It varies in width between 75 and 140 m., and is about 400 m. long. Its navigation is difficult, owing to shoals and rocks, and particularly in the months of January and February, when a strong current sets through it from north to south.

MACAUCO. See LEMUR, *ante.*

MACAU'LAY, CATHARINE (SAWBRIDGE), 1733–91; b. England; married in 1760 Dr. George Macaulay, a London physician; and after his death a clergyman named Graham. She published *The History of England, from the Accession of James I. to that of the Brunswick Line*, 8 vols., 1763–83; *Remarks on Hobbe's Rudiments of Government and Society*, 1767; *A Modest Plea for the Property of Copyright*, 1774; and other works. She was a pronounced republican and a friend of Washington, whom she visited in America in 1785.

MACAULAY, THOMAS BABINGTON, Lord, son of Zachary Macaulay, a West India merchant and eminent philanthropist, and grandson of the rev. John Macaulay, a Presbyterian minister in the w. of Scotland, was b. at Rothley Temple, Leicestershire, Oct. 25, 1800. He entered Trinity college, Cambridge, at the age of 18, where he acquired a brilliant reputation both as a scholar and debater. He twice won the chancellor's medal—first in 1819, for a poem on *Pompeii*, and again in 1820, for another on *Evening*, both of which were published. In 1821 he obtained the second Craven scholarship, took the degree of B.A. in 1822, was shortly after elected a fellow of Trinity, and then began to devote himself zealously to literature. The periodical to which he first contributed was *Knight's Quarterly Magazine;* for this he wrote several of his ballads, e.g., *The Spanish Armada, Moncontour,* and *The Battle of Ivry,* besides essays and critiques. In 1825 he took the degree of M.A., and in the same year made his appearance in the columns of the *Edinburgh Review* by his famous essay on Milton, the learning, eloquence, penetration, brilliancy of fancy, and generous enthusiasm of which quite fascinated the educated portion of the public. For nearly 20 years he was the popular, perhaps also the most distinguished, contributor to the *Blue and Yellow.* In 1826 he was called to the bar at Lincoln's Inn, but it does not appear that he practiced. The tide of political agitation was beginning to rise high, and Macaulay was borne along with the current. There can be no doubt that Macaulay was an immense accession to the whig party, for he believed in whiggism with a profound sincerity that has never been questioned; and he was able to present the grounds of his belief in a manner so powerful and attractive that his very opponents were charmed, and almost convinced. In 1830 he entered parliament for the pocket-borough of Calne (which was placed at his service by the marquis of Lansdowne) just in time to take part in the memorable struggle for reform, in favor of which he made several weighty and effective speeches. When the first reformed parliament assembled in 1832 Macaulay sat as member for Leeds, and at once took a prominent position in the house. He was now made secretary of the board of control for India; and in the following year went out to India as a member of the supreme council. Here he remained till 1838. His chief labor was the preparation of a new Indian penal code. A conspicuous feature of this code was the humane consideration it displayed for the natives (which drew down upon its author the hostility of the Anglo-Indians). On his return to England he resumed his political career, and was elected M.P. for the city of Edinburgh in 1839. In 1840 he was appointed war-secretary. While holding office he composed, appropriately enough, those magnificent martial ballads, the *Lays of Ancient Rome* (1842); and in the following year published a collected series of his *Essays* in 3 vols. In 1846 he was made paymaster-general. Macaulay had always been one of the most courageous and unflinching advocates of religious freedom: accordingly he had defended the Roman Catholic relief bill; his first speech in the house of commons was in support of the bill to repeal the civil disabilities of the Jews, and now he supported the Maynooth grant. At this period, unfortunately for Macaulay, Edinburgh was the arena of great ecclesiastical fermentation; and because he advocated a measure intended to moderate the natural discontent of Roman Catholics, he was ousted from his seat at the general election in 1847. Five years later (1852) Edinburgh did what it could in the way of reparation by re-electing Macaulay without a single movement made by him on his own behalf. In 1848 appeared the first two volumes of his *History of England from the Accession of James II.,* the popularity of which must have made even successful novelists envious; next year he was chosen lord-rector of the university of Glasgow, on which occasion he received the freedom of the city. When the third and fourth volumes of his *History* were published in 1855, they occasioned a furore of excitement among publishers and readers, "to which," it is said, "the annals of Paternoster row hardly furnish any parallel." In 1857 the French academy of moral and political sciences made him a foreign associate; and in the course of the same year he was raised to the peerage of Great Britain under the title of baron Macaulay of Rothley. His health, however,

had long been failing, and on Dec. 28, 1859, he expired somewhat suddenly at his residence, Holly Lodge, Campden Hill, Kensington, London. He was buried in Westminster abbey. Vol. V. of his *History*, a fragment, was published in 1861; and a complete edition of his works, by his sister, lady Trevelyan appeared in 1866. *The Life and Letters of Lord Macaulay*, by his nephew, George Otto Trevelyan, M.P., an able and fascinating biography, was published in 1876.

Macaulay was indisputably a man of splendid talent. His scholarship—in the strictly classical sense of the term—was admirable; his miscellaneous literary acquisitions were something prodigious; his knowledge of modern European, and especially of English, history from the age of Henry VIII. down to his own, was unsurpassed—we might with safety say, unequaled; in addition, he had a sagacity and swiftness of understanding that enabled him to comprehend and rapidly methodize his vast array of facts; and what is perhaps more wonderful than all, his style is not in the least affected by the immensity of his attainments. He "wears all his load of learning lightly as a flower." In ease, purity, grace, force, and point, he rivals those who have made felicity of style their chief study. He has been accused of partiality, of exaggeration, and of gratifying his passion for epigram at the expense of truth; his *History* has been termed a "huge whig pamphlet;" and strong exception has been taken to particular passages, where his views appear to some to be biased by personal antipathies, such as his description of Scotland, the Highlands, the massacre of Glencoe, Marlborough, Penn, etc.; but the essential truth and accuracy of his narrative, as a whole, has never been disproved.

MACAU'LEY, CATHARINE E., 1787–1841; b. Ireland. A wealthy man named Callahan, who had adopted her, left her at his death a considerable fortune, with which she founded in 1827, at Dublin, a home for poor women out of work; this was finally called the "institute of our blessed lady of mercy," and was devoted to the care of the sick. Miss MacAuley became superior of the order of the sisters of mercy to which the Dublin institution gave rise, and that order has since spread through Europe and America.

MACAW', *Macrocercus*, a genus of the parrot family (*psittacidæ*), distinguished by a very long wedge-shaped tail, long and pointed wings, large strong feet, the sides of the head naked, the bill short and very strong, the upper mandible greatly arched, and having a long sharp tip, the lower mandible much shorter, and of massive thickness. The species are among the largest and most splendid of the parrot race; they are all natives of tropical America. They do not readily learn to articulate, their attainments seldom exceeding one or two words, but are easily domesticated, and become much attached to those with whom they are well acquainted. Their natural notes are hoarse and piercing screams. They are more or less gregarious, and the appearance of a flock of macaws in bright sunshine is wonderfully brilliant. They breed twice a year, and lay their eggs—generally two—in the hollows of decayed trees. They feed chiefly on fruits and seeds; and often commit great depredations on fields of maize. One of the flock is set to watch on some elevated situation, and on the approach of danger, gives the alarm by a cry. In domestication, macaws readily eat bread, sugar, etc.—The GREAT SCARLET MACAW (*M. aracanga*) is sometimes more than 3 ft. in length, including the long tail.—The GREAT GREEN MACAW (*M. militaris*) and the BLUE AND YELDOW MACAW (*M. aravauna*) are rather smaller. These are among the best known species. The other species are numerous.—Allied to the macaws, but approaching to the parakeets, are the species forming the genus *psittacara*, all of them also natives of the new world. The cheeks are feathered, and the bill less arched than in the true macaws.—Allied to them also are the araras, of which one, the CAROLINA ARARA, or CAROLINA PARROT (*arara Carolinensis*), extends much further north in America than any other of the parrot family. It is about 14 in. long, gay with green and gold, is gregarious, and commits great depredations in orchards and maize-fields. It cannot be taught to articulate words, but readily becomes very familiar.

MACAW-TREE, GREAT, *Acrocomia sclerocarpa*, a palm of the same tribe with the cocoa-nut, a native of the West Indies, and of the warm parts of America. It is called *macoya* in Guiana, and *macahuba* in Brazil. It is from 20 to 30 ft. high, with pinnated leaves, from 10 to 15 ft. long. The fruit yields an oil, of a yellow color, of the consistence of butter, with a sweetish taste, and an odor of violets, used, in the native regions of the tree, as an emollient in painful affections of the joints, and extensively imported into Britain, where it is sometimes sold as *palm oil*, to be used in the manufacture of toilet-soaps.

MACBETH (or MACBEATHAD MACFINLEGH, as he is called in contemporary chronicles), a king of Scotland, immortalized by the genius of Shakespeare. From his father Finlegh, the son of Ruadhri, he inherited the rule of the province of Moray; and he became allied with the royal line by his marriage with Gruoch MacBoedhe, the granddaughter of king Kenneth MacDuff. In the year 1039 he headed an attack upon king Duncan MacCrinan, at a place called Bothgouanan (the "Smith's Bothy"), where the king was mortally wounded, but survived to be carried to Elgin, in Moray. Macbeth now ascended the throne, and his reign of 17 years is commemorated in the chronicles as a time of plenty. He made grants to the Culdees of Loch Leven, and in the year 1050 went in pilgrimage to Rome. Malcolm MacDuncan, or Ceanmore, the eldest son of king Duncan MacCrinan, had fled to England on his father's death; and in the sum-

mer of 1054, his kinsman, Siward, earl of Northumberland, led an English army into Scotland against Macbeth. That king was defeated with great slaughter, but escaped from the field, and still kept the throne. Four years afterwards, he was again defeated by Malcolm MacDuncan, and fleeing northwards across the mountain-range since called the Grampians, he was slain at Lumphanan, in Aberdeenshire, on Dec. 5, 1056. His followers were able to place his nephew, or step-son, Lulach, on the throne; and his defeat and death at Essie, in Strathbogie, on April 3, 1057, opened the succession to Malcolm, who three weeks afterwards, was crowned at Scone. This is all that is certainly known of the history of Macbeth. The fables which gradually accumulated round his name were systematized in the beginning of the 16th c. by the historian Hector Boece, from whose pages they were transferred to the chronicle of Hollinshed, where they met the eye of Shakespeare. Nearly half a century before his great play was written, Buchanan had remarked how well the legend of Macbeth was fitted for the stage.

McCABE, James D., Jr., b. Richmond, Va., about 1840; received his education at the Virginia military institute; began very early to write for the press, and during the rebellion employed his pen in the service of the confederacy. He has published a *Life of Lieut.-Gen. T. J. Jackson*, a *Memoir of Gen. A. S. Johnston*, and *The Life and Campaigns of Gen. R. E. Lee*. He has also written many poems and short stories.

MAC'CABEES, a word of uncertain meaning and origin. The founder of the Maccabean dynasty, Matithjahu (Asamonaios, Chashmonaj), a priest (not, as generally supposed, a high-priest, nor even of the family of high-priests), was the first who made a stand against the persecutions of the Jewish nation and creed by Antiochus Epiphanes. At the beginning of the troubles, he had retired, together with his five sons, Jochanan (Gaddes—Kaddish), Simon (Tassi—Mathes), Jehudah (Makkabi), Eleazar (Avaran—*Syr.* Chavin), Jonathan (Apphus), to Modiin, a small place between Jerusalem and Joppa, to mourn in solitude over the desolation of the holy city and the desecration of the temple. But the Syrians pursued him thither. He being a person of importance, Apelles, a Syrian captain, endeavored to induce him, by tempting promises, to relinquish his faith, and to embrace the Greek religion. He answered by slaying with his own hand the first renegade Jew who approached the altar of idolatry. This gave the sign to a sudden outbreak. His sons, together with a handful of faithful men, rose against the national foe, destroyed all traces of heathen worship, already established in Modiin and its neighborhood, and fled into the wilderness of Judah. Their number soon increased; and not long after, they were able to make descents into the adjacent villages and cities, where they circumcised the children, and restored everywhere the ancient religion of Jehovah. At the death of Mattathiah (166 B.C.), which took place a few years after the outbreak, Judah Makkabi (166–161 B.C.) took the command of the patriots, and repulsed the enemy, notwithstanding his superior force, at Mizpah (6,000 against 70,000), Bethsur (10,000 against 65,000), and other places, reconquered Jerusalem, purified the temple (feast of reconsecration—Chanuka), and reinaugurated the holy service (164 B.C.). Having further concluded an alliance with the Romans, he fell in a battle against Bacchides (161 B.C.). His brother Jonathan, who succeeded him in the leadership, renewed the Roman alliance, and taking advantage of certain disputes about the Syrian throne, rendered vacant by the death of Antiochus, acquired the dignity of high-priest. But Tryphon, the guardian of the young prince Antiochus Theos, fearing his influence, invited him to Ptolemais, and had him there treacherously executed. Simon, the second brother, was elected by the Jewish commonwealth to assume the reins of the national government, and was formally recognized both by Demetrius, Tryphon's antagonist, and by the Romans as "chief and ruler of the Jews." He completely re-established the independence of the nation, and the year after his succession (141 B.C.) was made the starting-point of a new era. The almost absolute power in his hands he used with wise moderation; justice and righteousness flourished in his days, and "Judah prospered as of old." But not long (7 years) after his accession to the supremacy, he was foully murdered (136 B.C.) by his own son-in-law, Ptolemy, who vainly hoped to succeed him. For the subsequent history of this family, see Jews; Hyrcanus; and Herod. The feast of the Maccabees—i.e., both of the sons of Mattathiah, and of the seven martyr children (2 Macc. 7)—is found in the Roman martyrology under the date of Aug. 1.

MAC'CABEES, BOOKS OF, certain apocryphal writings of the Old Testament, treating chiefly of the history of the Maccabees (q.v.). They are usually divided into four parts, or books; the first of which—the most important—comprising the period 175–135 B.C., relates the events which took place in Judæa, Antiochus IV. Epiphanes's misdeeds against the temple, the city, and the nation (ch. i., ii.); the rising of Mattathiah and his sons against the oppressor, the heroic deeds of Judah Maccabeus (iii.–ix.), of Jonathan (ix.–xii.), and Simon, until the election of Johannes Hyrcanus to the dignity of high-priest. The account, which bears the aspect of strict truthfulness, proceeds chronologically after the Seleucidian era. According to Origen and Jerome, this book was originally written in Hebrew. The author, probably a Palestinian, composed it partly from traditions, partly from official documents, after the death of Simon, during the high-priesthood of Johannes Hyrcanus, and it was shortly afterwards translated into Greek, Syriac, and Latin. The second book contains—1. Two letters from the Pal-

estinian to the Egyptian Jews, inviting them to celebrate the feast of the reinauguration of the temple (Chanukah), (i., ii.); and 2. An extract, with introduction and epilogue, from the five books of the Maccabees, by Jason of Cyrene. This second portion begins with the spoliation of the temple by Hesiodorus, under Seleucus Philopator, and ends with the death of Nicanor; thus embracing the period 176–161 B.C. The two letters are spurious, and of a late date; and the extract from Jason's work—to a great extent, only an embellished repetition of the first book of the Maccabees, of a partly moralizing, partly legendary nature—contains many chronological and historical errors, and bears altogether the stamp of being written for merely religious and didactic purposes. The date both of the original and the extract are very uncertain, but the latter does not seem to have been made before the middle of the 1st century B.C.

These two books (*Sifre Chashmonaim*) are the only ones received in the Vulgate, and declared canonical by the councils of Florence and Trent, and translated by Luther. The third and fourth, however, appear to have been altogether unknown to the western church. The former of these treats of an ante-Maccabean incident: the miraculous salvation of the Jews in Egypt whom Ptolemæus Philopator (221–204 B.C.) tried to force into idolatry. The style and general contents of this book point to an Alexandrine Hellenist as the author or compiler (about 200 B.C.); some investigators (Ewald, Grimm), however, are of opinion that the whole is a poetical invention, intended as a typical description of the circumstances of the Jews under Caligula. The fourth book, wrongly supposed to be identical with Josephus's *Supremacy of Reason*, contains, chiefly, the martyrdom of Eleazar and the seven brothers, and is probably also the work of an Alexandrine Jew living in Egypt—perhaps at the time of Herod the great—and belonging to the Stoic school. Declamations, dialogues, monologues, and the like, are of frequent occurrence, and impart to the book the character of a most artificial and strained composition. There is also a so-called fifth book of Maccabees to be found in the Polyglot, but only the Arabic and Syriac versions, not the Greek original—the unique MS. of which is supposed to have perished—are extant. See APOCRYPHA, BIBLE.

McCALL, GEORGE ARCHIBALD, 1802–68; b. Penn.; graduated at West Point in 1822; entered the army and was made first lieut. in 1829, capt. in 1836, and maj. in 1847. He served with distinction in the Florida and Mexican wars, was made inspector-gen. in 1850, and resigned in 1853. In 1861 he commanded a volunteer force called the Pennsylvania "reserve corps," receiving a maj.-gen.'s commission from that state. His corps was attached to the army of the Potomac, and he led it through part of the peninsula campaign of 1862, till the battle of Frazier's Farm, where he was taken prisoner. He was exchanged in August, but his health prevented his returning to the army, from which he resigned in Mar., 1863.

MACCALU'BA, an interesting mud volcano or air volcano of Sicily, situated not far from the road between Girgenti and Aragona. It is known to have been in a state of frequent activity for the last 15 centuries. It consists of a large truncated cone of barren argillaceous earth, elevated about 200 ft. above the surrounding plain, with wide cracks in all directions, and numerous little hillocks with craters, which at times emit a hollow rumbling noise, and throw up a fine cold mud mixed with water, a little petroleum and sulphureous gas. Reports like the discharge of artillery are occasionally heard; slight local earthquakes are felt, and mud and stones are thrown up to a height of 30 ft. or more.

McCARTEE, ROBERT, D.D., 1791–1865; b. N. Y.; graduated at Columbia college, 1808; having studied law and practiced it for several years, he entered the theological seminary of the Associate Reformed church and in 1816 was licensed to preach; in 1817 installed pastor of the Old Scots' church, Philadelphia, which was greatly strengthened under his ministry; in 1822 became pastor of the Irish Presbyterian church, New York, which, under his charge, increased from 30 members to more than 1000, becoming one of the prominent churches in the denomination; in 1836, because of impaired health, he took a less laborious charge at Port Carbon, Penn., where he formed a lyceum of natural history and was a zealous promoter of education among the miners; in 1840 removed to Goshen, N.Y.; in 1849 to Newburg; 1856–62, pastor of the Twenty-fifth Street Associate church, New York city; after which, in declining health, he spent the remainder of his useful life at Yonkers, N.Y.

McCARTHY, JUSTIN, b. Cork, Ireland, 1830; entered upon the career of a journalist at the age of 16 years by joining the staff of the Cork *Examiner*, which paper he left in 1853 to connect himself with the Liverpool *Northern Times*. He entered the reporters' gallery of the house of commons in 1860 as a reporter for the *Morning Star*, of which journal he became foreign editor the next year, and editor-in-chief in 1864, in which position he remained four years. In 1868 he made a tour in the United States, where he remained three years, occupying the most of his time in travel, and visiting 35 states. Mr. McCarthy published his first novel, *Paul Messie*, anonymously in 1866; this was followed by *The Waterdale Neighbors*, 1867; *My Enemy's Daughter*, 1869; *Lady Judith*, 1871; *A Fair Saxon*, 1873; *Linley Rochford*, 1874; *Dear Lady Disdain*, 1875; *Miss Misanthrope*, 1877; *Donna Quixotte*, 1879; and *The Comet of a Season*, 1881. He also wrote numerous papers for the *Galaxy* (New York), some of which were compiled and published in a volume under the title *Modern Leaders;* and *A History of Our Own Times*

being a chronicle of the events of the reign of queen Victoria, 1877–80. In 1879 he was elected to parliament from Longford, Ireland, as a "home ruler."

McCAUL, JOHN, D.D., LL.D., b. Dublin, 1810; educated at Trinity college, Dublin, obtaining the highest honors, and appointed classical tutor and examiner; appointed in 1838 principal of the Upper Canada college; in 1842 became vice-president of King's college, and professor of the classics, logic, and rhetoric; president of the university of Toronto; in 1853 president of University college, and vice-chancellor of the university of Toronto. He has published essays on classical subjects, lectures on Homer and Virgil, and edited some of the classics, also a Canadian monthly, the *Maple Leaf*. His *Britanno-Roman Inscriptions* and *Christian Epitaphs of the First Six Centuries* are valuable works. He composed, also, some anthems and other pieces of music.

McCAW, JAMES BROWN, 1772–1846; b. Va.; studied medicine at the university of Edinburgh, and returning to Virginia became the principal surgeon in the state.

McCAW, JAMES BROWN, b. Richmond, Va., 1823; graduated at the university of New York in 1844; edited the *Virginia Medical and Surgical Journal* 12 years; was first lecturer, then professor in the Virginia medical college. During the rebellion he organized the Chimborazo hospital at Richmond, in which over 70,000 patients were treated.

McCHEYNÉ, ROBERT MURRAY, 1813–43; b. Edinburgh; entering the high school at the age of eight, he held high rank in his classes; educated at the university of Edinburgh in 1827–31, gaining prizes in various departments of studies; in 1831 commenced the study of theology with Dr. Chalmers and Dr. Welsh; was licensed to preach in 1835, and began his ministry at Larbert, a parish of 6,000 people. He was then an intense student of the Bible, reading it in Hebrew and Greek. In 1836 he was ordained and installed pastor of St. Peter's church, Dundee. After several years, his health failing, he resigned, and went to Palestine, with three others, on a "mission of inquiry to the Jews." Returning with improved health, he resumed his pastorate of St. Peter's till 1842, when, his health again failing, he made a tour through the n. of England, preaching in the open air and in churches of different denominations. Returning to Dundee, he had an assistant, and in 1843 made another tour as an evangelist. He was pre-eminent as a pastor, preacher, and Christian. His earnest and faithful labors were instrumental in the conversion of great numbers in the memorable revival of 1839. He possessed fine literary taste, and left several hymns of great beauty. In 1827 a collection of his works was published in two volumes, and several volumes of his remains, letters, and fragments have been issued. The *Narrative of a Mission of Inquiry to the Jews from the Church of Scotland*, in connection with the rev. A. A. Bonar, in two volumes, was published in 1839. His life also has been written by Mr. Bonar.

MACCHIAVELLI, NICCOLO DI BERNARDO DEI, born of an ancient but decayed family at Florence, in 1469, and a pupil of the celebrated scholar, Marcello Virgilio, was employed in public affairs from a very early age, and may be regarded as the literary representative of the political life of the important period to which he belongs. From a subordinate post in the office of the chancellor of Florence, which he held at that critical period of the republic which succeeded the expulsion of the Medici in 1493, he rose, in 1498, to the place of secretary of the "ten," which, in the Florentine constitution of that day, may be regarded as the ministry of foreign affairs. Macchiavelli s duties were almost entirely diplomatic; he was employed in a great variety of missions, the instructions and correspondence connected with which may almost be said to contain the secret political history of Italy during his time. The culminating point of Macchiavelli's reputation as a diplomatist was his mission to the great master of treachery and dissimulation, Cæsar Borgia, duke of Valentino, in 1502, of which an account is preserved in 52 letters written during the course of the negotiation, not surpassed in dramatic interest by any series of state-papers which has ever been produced. In the complicated external relations which Italy had now assumed, and which have remained with few changes to the present day, Macchiavelli is found in communication with all the great foreign powers, as he had hitherto been with the Italian principalities. In 1507 he was sent to the emperor Maximilian; and in 1510 he undertook a mission to France (the third time he had visited that country in a diplomatic capacity), which had a most important bearing on the relation of France with Italy, and the results of which will be best understood by comparing the league of Cambrai with the subsequent alliance for the expulsion of the French out of Italy. On the restoration of the Medici in 1512, Macchiavelli was involved in the downfall of his patron, the Gonfaloniere Soderini. He was arrested on a charge of conspiracy in 1513. On being put to the torture, he disclaimed all knowledge of the alleged conspiracy; but although pardoned, in virtue of the amnesty ordered by Leo X., he was obliged for several years to withdraw from public life, during which period he devoted himself to literature. It was not till the death of Lorenzo de' Medici, in 1519, that Macchiavelli began to recover favor. He was commissioned in that year, by Leo X., to draw up his report on a reform of the state of Florence; and in 1521, and the following years, he resumed his old official occupation, being employed in various diplomatic services to several of the states of Italy. On his return to Florence in May, 1527, he was taken ill, and having trusted to his own treatment of himself, the malady assumed a very formidable character, and in the end proved fatal.

on June 22, 1527, just as Macchiavelli had completed his 58th year. Some difference of opinion has existed as to his religious belief, and as to his sentiments during his last hours; but it seems certain that his death was marked by sentiments of religion, and accompanied by the ordinary ministrations of his church. His last years, however, were comparatively neglected. He was buried in the family vault in the church of Santa Croce; but it was only in 1787, and then through the munificence of a foreigner, the earl Cowper, that a monument was raised to his memory.

Macchiavelli's writings are very numerous, filling 6 vols. 4to (Florence, 1783), or 10 vols. 8vo. Besides his letters and state-papers, which, as we have seen, are of the highest interest, his historical writings also comprise *Florentine Histories*, extending from 1215 to 1492, with a fragmentary continuation to 1499; *Discourses on the First Decade of Titus Livius;* a *Life of Castruccio Castracani* (unfinished); a *History of the Affairs of Lucca*. His literary works comprise comedies, an imitation of the *Golden Ass* of Apuleius, an essay on the Italian language, and several minor compositions. He also wrote *Seven Books on the Art of War*, which has been much admired by the learned in military science. But the great source of his reputation, for good or for evil, is the celebrated book, *De Principatibus*, or, as it has since been called, *Del Principe*, some account of which is indispensable, in order to a just appreciation of the author. The main question discussed in this world-famed book is: "How principalities may be governed and maintained." In resolving this question, various cases are supposed, for each of which, appropriate rules, principles, and suggestions are laid down, and all are illustrated both by contemporary examples and by a wealth of historical learning which it is difficult to overrate. The 7th chapter, in which he details, and with evident admiration, the system of Cæsar Borgia, and the 18th, in which he discusses "the duty of princes as to the obligation of keeping faith," are perhaps those which have most contributed to draw upon the author the odious reputation of which his very name has become the symbol; but, in truth, these chapters are only more precise and more formal than the rest, from their heaping together statements which are elsewhere insinuated or supposed; the broad scheme of the book being everywhere the same, viz., that, for the establishment and maintenance of authority, all means may be resorted to; and that the worst and most treacherous acts of the ruler, however unlawful in themselves, are justified by the wickedness and treachery of the governed. Such being the moral of the book, a question has arisen as to the intention of the writer, and a favorite theory for a time prevailed that *The Prince* was but a satire upon absolutism, and was designed to serve the cause of liberty, of which Macchiavelli was an ardent friend, by making arbitrary power odious and contemptible. This theory, however, besides being utterly irreconcilable with the tone of the work, is completely disproved by a letter of Macchiavelli to his friend Vettori, 1513, which was only discovered in 1810, and which shows that *The Prince* was written by Macchiavelli in all seriousness, in order to recommend himself to the Medici (for whose private perusal it was designed, and not for publication) as a master in the art of government. In his ardor for the liberation of Italy from the rule of foreigners, Macchiavelli had become convinced that strong native governments, even though absolute, must be endured; and, having accepted that of the Medici for Florence, he was content to use all means for its security and consolidation. *The Prince* was published after Macchiavelli's death, at Rome, in 1532; and if any doubt should be entertained as to the seriousness of the author, it need only be compared with the commentary which is furnished by every page of his *Legazioni*, or the reports of his diplomatic missions, which are also contained in his collected works. Of the many criticisms and rejoinders to which *The Prince* has given occasion, the most remarkable is that of Frederick the great, *Antimacchiavelli, ou Examen du Prince de Macchiavelli*, 1740. It may be added that *The Prince* was condemned by pope Clement VIII.

McCLELLAN, George, 1796–1847; b. Conn.; educated at Yale, and graduated in medicine from the University of Pennsylvania in 1819. He was one of the founders of, and a professor in, the Jefferson medical college, Philadelphia, 1826–39; and in the Gettysburg medical college from 1839–43. He published *The Principles and Practice of Surgery*, and his rank as a surgeon was high.

McCLELLAN, George Brinton, Mag.-gen. U.S.A., was b. at Philadelphia in Dec., 1826. In his 16th year he was sent to the United States military academy at West Point, where he graduated with high honors in 1846, and joined the army as second lieut. of engineers, to take an active part in the Mexican war, where he distinguished himself under gen. Scott, in the battles of Contreras, Churubusco, Molino del Rey, and Chapultepec, and was promoted to a captaincy. At the end of the war he was appointed to a professorship at West Point, and wrote a manual on the art of war. He built fort Delaware, commenced a topographical survey for the Pacific railway, and was one of three American officers sent to observe the campaign in the Crimea. On his return to America, he resigned his commission in the army, and became technical director of the Illinois Central railway. At the commencement of the war of secession, 1861, he was appointed maj.gen. of the Ohio militia, but, by the advice of gen. Scott, he was tendered by president Lincoln the position of maj.gen. of the army. After a successful campaign in western Virginia, he was made commander-in-chief, and reorganized the army of the Potomac, defeated at Bull Run, July 21, 1861. In the summer of 1862 he

invaded Virginia, by the peninsula of James river, and advanced near to Richmond, but was defeated in a series of battles in July, and compelled to retreat, and finally to evacuate the peninsula. After the defeat of gen. Pope, in the second battle of Bull Run, Aug. 29, 1862, which was followed by a confederate invasion of Maryland, he reorganized the army at Washington, marched rapidly north, met the forces of gen. Lee at Antietam, and compelled him to recross the Potomac. He followed the confederates into Virginia, but being opposed to the policy of the extreme war-party, he was superseded by gen. Burnside. In 1864 he was the democratic candidate for the presidency. He was then in Europe till 1868, and in 1877 was elected governor of New Jersey. He has published several military papers.

McCLELLAN, George Brinton (*ante*); son of George, who was a distinguished physician, graduate of Yale college, and founder of Jefferson college. His remoter ancestors were Scotch. At West Point he gained a reputation for close application and intelligent study, rather than for brilliancy or showy talents. It was a surprise when this quiet, thoughtful, but not remarkable student graduated second in general rank in the largest class that had ever left the academy, and first in the class of engineering. In the spring of 1855 he was appointed to a captaincy in the first cavalry regiment, under col. Sumner As one of the commission sent to the Crimea, he combined in making the official report, which was published by the U. S. government, and which recommended improvements in the organization and discipline of the American army. Soon after entering the service of the Illinois Central railroad, he became vice-president of the road. In May, 1860, he married the daughter of gen. R. B. Marcy. In August of that year he resigned his position in the Illinois Central, to assume the presidency of the Ohio and Mississippi railroad, which post he held, residing in Cincinnati, until the outbreak of the rebellion. His commission of maj.gen. of volunteers bore date April 23, 1861, and he was at once appointed to organize the regiments forming in the state of Ohio. Called to the command of the armies of the United States after the disastrous affair of the first Bull Run, gen. McClellan soon discovered the potent influence which politics were destined to exercise over the progress of the conflict. Chafing under the first serious repulse of the war, the people clamored for immediate action, while to many politicians this was not desirable. Cross-purposes resulted in placing the young commander at a disadvantage; and from the period of his being placed in supreme command, to that when he was ordered to resign in favor of gen. Pope, he may be said never to have been relieved from the trammels of politics. The great success which he gained at Antietam revived the drooping hopes of the country, and it is on record that his final supersedure by gen. Burnside was against the judgment of that officer, who was presently defeated at Fredericksburg, to be succeeded in turn by gen. Hooker, who immediately went into winter cantonments. From Antietam to Gettysburg, the history of the army of the Potomac was a history of defeat and disaster. In the presidential campaign of 1864, gen. McClellan received a popular vote of 1,800,000, Mr. Lincoln receiving 2,200,000. After his return from Europe in 1868, he made his home at Orange mountain, New Jersey, and Nov. 6, 1877, was elected governor of that state, filling the chair until 1881. On his retirement from that position he assumed the office of president of a new underground railroad company organized in the city of New York. Gen. McClellan is the author of a volume of the series of government reports of the survey for the Pacific railroad; *The Armies of Europe*, 1861; *Report on the Organization and Campaigns of the Army of the Potomac;* and a number of important articles contributed to the *North American Review*, and other periodicals, including the valuable series of papers published in 1877 on the Russo-Turkish war. As a scientific and practical engineer he stands in the first rank; while even his opponents concede his abilities as a military critic and organizer, his conscientiousness and unassuming worth.

McCLERNAND, John A., b. Ky., 1812; passed his early youth at Shawneetown, Ill., on the Ohio river, 182 m. s.e. of Springfield, where his mother had removed on the death of his father in 1816. Here his time was divided between the labor of the farm and the study of the law until 1832, when he was admitted to the bar. In 1833, having served as a private in the war against Black Hawk, chief of the Sac and Fox tribes, which ended Aug. 2 of that year in the defeat of the Indians near the Wisconsin river, he resumed the practice of his profession, and engaged in mercantile pursuits. In 1835 he became the editor and publisher of *The Democrat*. In 1836 he represented his district in the state legislature, and again in 1840 and 1842. From 1843 to 1851 he was member of congress from Illinois. In 1851 he removed to Jacksonville, and in 1859 was elected congressman from the Springfield district. At the breaking out of the rebellion, having been appointed brig.gen. May 17, 1861, he raised by his personal influence, with that of cols. Logan and Fonke, the McClernand brigade, which he commanded at the battle of Belmont, on the Mississippi river, opposite Columbus, Ky., Nov. 7 of the same year, where, being greatly outnumbered, his force suffered defeat. In Feb., 1862, he gallantly led his command, on the right of the union lines, at the bombardment of fort Donelson, and was promoted in the following March to the command of a division, which he led April 6 and 7 at the battle of Shiloh, or Pittsburg Landing, against gens. A. S. Johnston and Beauregard, resulting in the death of gen. Johnston and the retreat of the confederates. On Jan. 4, 1863, he superseded gen. W. T. Sherman in the com-

mand of the forces threatening Vicksburg (the latter gen. retaining the command of his own corps, the 15th), until relieved by gen. Grant, who was placed at the head of all the forces operating against Vicksburg. On Jan. 11, his division being combined with the naval forces under admiral Porter, he commanded the expedition that finally carried by storm the garrisoned village of Arkansas Post, taking a number of prisoners and immense quantities of commissary stores. He also distinguished himself on the Big Black river, May 12, 1863, and on the morning after the battle of Champion hills, May 16, 1863, sometimes called Baker's creek. This desperate struggle lasted five hours, in which the confederates were forced back to the Big Black river, losing heavily in men and artillery, his own corps, with that of gen. McPherson's, suffering terribly in killed and wounded. The confederates, having intrenched themselves on both banks of the river, were successfully assaulted, 17 pieces of their artillery were captured, and the remnant of gen. Pemberton's army was compelled to retreat to their stronghold of Vicksburg. On Nov. 30, 1864, he resigned his commission as maj.gen. of the 13th army corps, and retired to private life.

MAC'CLESFIELD, an important manufacturing t. of Cheshire, England, is situated on the river Bollin, on the western base of a range of low hills, 15 m. s.s.e. of Manchester. It contains a fine old church, St. Michael's, founded in 1278; and a grammar school, endowed in 1502, and having an annual revenue of £1500. Within the present century Macclesfield has advanced rapidly as a seat of manufactures. Silks, embracing the finest varieties, are the principal fabrics made; cotton goods and small-wares are manufactured, and there are dye-works and breweries. In the vicinity, coal, slate, and stone are obtained. Macclesfield returns two members to the house of commons. Pop. '71, 35,570, showing a slight decrease since 1861.

McCLINTOCK, Sir FRANCIS LEOPOLD, D.C.L., LL.D., b. Ireland, 1819; entered the navy in 1831, and in 1838, having passed his examinations, he went to South America in the steamship *Gorgon*. For his services in bringing off the *Gorgon*, which ran ashore near Montevideo, he was made a lieut. in 1845. He was attached to the Pacific squadron, 1845–47, and in 1848 was a member of the Arctic expedition under sir James C. Ross for the relief of sir John Franklin. In 1850 he was first lieut. of the *Resistance* in the Arctic expedition under capt. Austin; and in April, 1851, began a sledge journey along the northern shore of Parry sound, traveling 760 m. in 80 days. On his return to England he was made a commander, and in 1852 commanded the *Intrepid*, in the Arctic expedition under sir Edward Belcher. He succeeded in rescuing McClure near Melville island, but was afterwards obliged to abandon his vessel; and only one of the five ships which had composed Belcher's expedition succeeded in reaching England. In 1857 McClintock, who in the meantime had been promoted to a captaincy, started in search of sir John Franklin, in command of the *Fox*, a screw-steamer of 177 tons, fitted out by lady Franklin. On the north-western coast of King William Land he found records of the death of sir John Franklin, and of the abandonment of the *Erebus* and *Terror*. On his return in 1859 he was knighted, and received the degree of doctor of laws from the universities of Oxford, Cambridge, and Dublin. In 1865 he was made commodore of the Jamaica station, and in 1872 vice-admiral. He published, in 1869, *Voyage of the Fox in the Arctic Seas*.

McCLINTOCK, JOHN, D.D., LL.D., 1814–70; b. Philadelphia; graduated at the university of Pennsylvania in 1835; ordained a minister of the Methodist Episcopal church, and appointed professor of mathematics in Dickinson college in 1837; in 1840 transferred to the professorship of Greek and Latin; translated, with Dr. Blumenthal, in 1847, Neander's *Life of Christ;* and, with prof. Crooks prepared a series of Greek and Latin text-books; in 1848 was elected by the general conference editor of the *Methodist Quarterly Review*, retaining the position for eight years. In 1856 he was appointed, with bishop Simpson, a delegate to the Wesleyan Methodist conference of England, and to the evangelical alliance held at Berlin. In 1857 he became pastor of St. Paul's Methodist church in New York, and in 1860 was preacher in the American chapel in Paris. When in Europe, during the war of the rebellion, he advocated with ability the union cause, in conversation, by the pen, and on the platform; and his home in Paris was a rallying center for patriotic Americans. During his absence he was corresponding editor of the *Methodist*. Returning to America in 1864, he was again, for a short time, placed in charge of St. Paul's church in New York. His health failing, he resigned in 1865, and resided in Germantown, Penn. In 1866 he removed to New Brunswick, supplying for a time St. James's church, and was made chairman of the central centenary committee of the Methodist Episcopal church. Through his influence, Daniel Drew, a member of St. Paul's church in New York, contributed a large sum to the centenary fund, which was appropriated for the founding of an institution at Madison, N. J., called the Drew theological seminary. Dr. McClintock was its president till his death. Dr. McClintock attained a high rank as a scholar, teacher, writer, and preacher, and for many years was a leader in the Methodist church. Besides the works mentioned, and numerous articles in periodicals, he published *Analysis of Watson's Theological Institutes; Sketches of Eminent Methodist Ministers; The Temporal Power of the Pope;* a translation of Bungener's *History of the Council of Trent*. In the last 20 years of his life he labored in preparing the *Cyclopædia of Biblical, Theological, and Ecclesiastical Literature*,

in connection with the rev. Dr. James Strong. At the time of Dr. McClintock's death three volumes had been published, the work being continued by Dr. Strong. Six volumes have since been issued. A volume of Dr. McClintock's sermons, entitled *Living Words*, and *Lectures on Theological Encyclopædia and Methodology*, have been published since his death.

McCLOSKEY, JOHN, D.D., Cardinal, b. Brooklyn, 1810; educated at St. Mary's college, Maryland, and ordained to the priesthood in 1834. After spending two years in Rome, he returned to New York, and became pastor of St. Joseph's church. In 1844 he was appointed coadjutor of bishop Hughes, and in 1847 was consecrated bishop of the new diocese of Albany, where he remained till 1864, when he succeeded Dr. Hughes as archbishop of New York. In 1875 Pius IX. made him a cardinal with the title of Santa Maria sopra Mineroa, and he received his cardinal's hat in Rome from Leo XIII. in 1878. He has shown himself a highly vigorous and successful administrator in all his responsible positions, and is both personally esteemed and popular as a cardinal-prince in his own communion and outside its bounds.

McCLUNG, JOHN ALEXANDER, D.D., 1804–59; b. Washington, Ky.; studied at Princeton theological seminary; was licensed to preach in the Presbyterian church in 1828; abandoned the ministry on account of doubts as to the authenticity of some books of the Bible, and commenced the study of law; admitted to the bar in 1835, and practiced with success till 1849, when he again entered the ministry; was ordained in 1851, and was pastor of the First Presbyterian church, Indianapolis, 1851–57; declined the presidency of Hanover college; was pastor at Maysville, Ky., in 1857. He was a man of brilliant intellect and solid learning.

McCLURE, ALEXANDER WILSON, D.D., 1808–65; b. Boston; educated at Yale and Amherst colleges and Andover theological seminary; settled pastor of the Congregational church at Malden, Mass., 1830–41; resided at St. Augustine, Fla., 1841–44; editor of the *Christian Observatory*, 1844–47; pastor again at Malden, 1848–52; pastor of the First Reformed church, Jersey City, 1852–55, and then became cor.sec. of the Am. and For. Christian union. His health having failed, he was sent in 1856 as chaplain of the Christian union to Rome, Italy. In 1858 he retired from public life, and was a great sufferer from disease until his death. The American chapel in Paris was erected with funds obtained by Dr. McClure. His contributions were numerous for the *Christian Observatory*, the *New Brunswick Review*, and *Literary and Theological Review*. He published also *Lives of the Chief Fathers of New England;* the *Bi-Centennial Book of Malden;* *The Translators' Revival*, besides several controversial religious treatises. He was a man of wit and learning and a skillful polemic, defending the old in theology and in ecclesiastical procedure.

McCLURE, Sir ROBERT JOHN LE MESURIER. See MACLURE, *ante*.

McCLURG, JAMES, 1747–1825; b. Va.; educated at William and Mary college and at the university of Edinburgh, where he took his medical degree in 1770. In London, where he continued his studies, he published an *Essay on the Human Bile*, which attracted much attention. On his return to Virginia he practiced his profession first at Williamsburg, and afterwards at Richmond, and stood at the head of the profession in the state. He was a member of the convention that framed the U. S. constitution.

McCOOK, a co. in s.e. Dakotah, formed since the census of 1870; watered by the Vermilion river; 432 sq.m. The soil is fertile and the surface mostly prairie land.

McCOOK, ALEXANDER McDOWELL, b. Columbiana co., Ohio, 1831; graduated at West Point, and entered the army in 1852 as brevet second lieut. of infantry. He was employed for a time in garrison duty, afterwards in Indian warfare, and in 1858 was appointed instructor in infantry tactics at West Point. On the outbreak of the rebellion he was appointed col. of the 1st Ohio volunteers, which he led in the first battle of Bull Run. In 1861 he was made brig.gen. of volunteers and assigned to a command in the army of the Cumberland. He commanded a division in the battle of Shiloh and the siege of Corinth; led the 1st army corps in the battle of Perryville, the 20th army corps at Stone river and Chickamauga, and the troops for the defense of Washington against Early in 1864. He was brevetted maj.gen. of the regular army, but having resigned his commission in 1865, was promoted in 1867 to be lieut.col. of infantry. His father and seven of his brothers served in the war, and the father and three of his sons were killed. Four of the eight brothers attained the rank of general.

McCOOK, EDWARD M., b. Steubenville, Ohio, 1834; received only a common-school education; accompanied governor Medary to Minnesota as his private secretary in 1856; in 1859 went to Pike's Peak, and in 1860 was a member of the Kansas legislature; enlisted in the war for the union, and led various successful cavalry raids in the Atlanta and other campaigns, attaining the rank of brig.gen. in 1864, and brevet maj.gen. in 1865. He was minister to the Sandwich islands from 1866 to 1869, and afterwards for six or seven years governor of Colorado.

MACCORD, LOUISA S. (CHEVES), daughter of Langdon Cheves, b. Columbia, S.C., 1810; was married in 1840 to David J. Maccord; in 1848 translated Bastiat's *Sophisms of*

the Protective Policy; in the same year published a volume of poems, *My Dreams;* and in 1851 *Caius Gracchus*, a tragedy. She wrote extensively for *De Bow's Review* and the *Southern Literary Messenger*, and during the rebellion rendered valuable service in the confederate hospitals.

McCORMICK, CYRUS HALL, b. Va., 1809; removed to Cincinnati in 1845, and to Chicago in 1847. In 1816 his father invented a machine intended to supersede the sickle and scythe in the harvest field; and the son, having had his thoughts thus early directed to the object, in 1831 produced and afterwards patented the reaping machine which, subsequently greatly improved by him, has become celebrated in different lands, and has won for its inventor many gold medals and other distinctions, as well as great wealth. In 1859 with a portion of his wealth he contributed largely to the establishment at Chicago of the Presbyterian theological seminary of the north-west; and has since endowed a professor's chair in Washington and Lee college, Lexington, Va., besides presenting to the institution a telescope, ordered from Alvan Clark on the stipulated condition that the object glass should be equal in size and finish to that of the similar instrument furnished by the same maker for the naval observatory at Washington, D. C. Mr. McCormick is a zealous upholder of the strict form of Calvinistic doctrine.

McCORMICK, RICHARD, C., Jr., b. N. Y., 1832; having received a classical and practical education, in 1850 he turned his attention to commercial pursuits in Wall street, New York. On his return from a tour through Europe and Asia Minor, he published a *Visit to the Camp before Sebastopol* (1855); *St. Paul to St. Sophia*, etc. From 1857 to '61 he was trustee of the New York public schools, became a journalist in 1859, and editor of the *Young Men's Magazine*. During the war of the rebellion he represented several New York journals as special correspondent. In 1862 he was appointed chief clerk of the department of agriculture, in 1863 secretary of Arizona, in 1866 governor of that territory, and was elected delegate to congress from Arizona for 6 years, 1869–75. At present, although residing in New York city, he is active in forwarding the mining interests of Arizona, and is president of the Freeland mine in Colorado. On Dec. 17, 1877, he was appointed U. S. commissioner-general to the Paris exposition, where his judicious conduct of affairs did full justice to the U. S. exhibits, and reflected credit on his administrative qualities. On Mar. 3, 1877, he had been made assistant secretary of the U. S. treasury, became one of the national republican committee on July 2 of the same year, and retired from the treasury department Sept. 15, 1877, on account of failing health.

McCOSH, JAMES, D.D., LL.D., b. in Ayrshire, Scotland, 1811; educated at the universities of Glasgow and Edinburgh; while at the latter he wrote an essay on the philosophy of the Stoics for which, on motion of sir William Hamilton, the honorary degree of A.M. was conferred on him; in 1835 was ordained a minister of the church of Scotland at Arbroath; in 1839 became pastor at Brechin, where he was active in the movement which, in 1843, resulted in the organization of the Free church; where also he published in 1850 his book on the *Methods of the Divine Government, Physical and Moral*, which laid the foundation of his fame as a philosophical writer. In 1851 was chosen professor of logic and metaphysics in Queen's college, Belfast, where he was distinguished as a lecturer; wrote in 1856, jointly with prof. George Dickie, M.D., *Typical Forms and Special Ends in Creation;* published, in 1866, *Intuitions of the Mind Inductively Investigated, being a Defense of Fundamental Truth;* in 1862, *The Supernatural in Relation to the Natural;* and in 1866, *An Examination of Mill's Philosophy*. In 1868, having been elected president of the college of New Jersey, he became a resident of Princeton, where he has, by his successful administration and wide reputation, contributed greatly to the remarkable prosperity which the institution now enjoys (see NEW JERSEY, COLLEGE OF). He has published *The Laws of Discursive Thought and a Treatise on Logic* (1869); *Christianity and Positivism*, a series of lectures delivered on the Ely foundation at the Union theological seminary in New York (1871); *The Scottish Philosophy, Biographical, Expository, and Critical, from Hutcheson to Hamilton* (1874); *A Reply to Professor Tyndall's Belfast Address* (1875); besides frequent contributions to the *Princeton Review* and other periodicals in this country and Great Britain. With a keen discriminative intellect he combines a broad mental scope; he has abundant philosophical learning, and holds stoutly to the ancient doctrinal system of his church in a spirit not averse to liberty and modern light. This liberality makes him an efficient critic of speculations that are put forth as facts.

McCOSKRY, SAMUEL ALLEN, D.D., D.C.L., b. Carlisle, Penn., 1804; was a cadet at West Point for one year; graduated at Dickinson college, and became a successful lawyer, but left that profession to become a minister of the Episcopal church. He was a rector first in Reading, Penn., then in Philadelphia, and consecrated bishop of Michigan in 1836. In 1878 he was deposed upon charges affecting his moral character.

McCRACKEN, a co. in w. Kentucky, bounded by the Tennessee and Ohio rivers, and traversed by the Clark river and the Paducah and Memphis railroad; 232 sq. m.; pop. '80, 16,260. It has a level surface and fertile soil, the productions being Irish and sweet potatoes, butter, tobacco, Indian corn, and wheat. There are manufactures of agricultural implements, carriages and wagons, tobacco, etc.

McCREA, JANE, 1754–77, b. N. J.; after the death of her father, a Scotch Presbyterian clergyman, she lived near fort Edward with her brother, who, on the arrival of Burgoyne in 1777, wishing to take her to some more protected place, sent for her to the house of a Mrs. McNeil at Fort Edward. His sister was engaged to David Jones, a tory and an officer in a loyalist regiment. In the hope of meeting him, whom she believed to be with Burgoyne's army, she put off her departure for some time, till, on the day it was to take place, the McNeil house was surrounded by Indians, and its inmates taken to Burgoyne's camp. Mrs. McNeil arrived there in safety, but a fresh party of Indians soon brought in the scalp of Miss McCrea. The manner of her death, which was the subject of a sharp correspondence between Burgoyne and Gates, is not known. The Indians pretended that she was killed by a stray shot from the Americans; and according to another story she was tomahawked in a dispute among the Indians as to whom she belonged. A later legend affirmed that the Indians had been employed by Jones to bring her to the British camp, and that they had murdered her in a quarrel as to the reward promised.

M'CRIE, Dr. THOMAS, a Scottish divine and historian, was b. at Dunse, in Berwickshire, Nov., 1772; studied at the university of Edinburgh, and was ordained, in 1795, pastor of an anti-Burgher congregation in that city. Here he died, Aug. 5, 1835. M'Crie's works are in the highest degree valuable to the student of Scottish ecclesiastical history. They exhibit a vast amount of minute yet important research, and though they are essentially apologetic, the author is never consciously unfair, and does not misstate facts. He has, however, a way of palliating even the indefensible acts of the reformers, and a zeal for Presbyterianism that caused the impartial Hallam to describe his spirit as *Presbyterian Hildebrandism*. M'Crie's best known works are *The Life of John Knox* (Edin. 1812; new ed. 1855–57) and *The Life of Andrew Melville* (1819).

McCULLOCH, a co. in w. Texas, having the Colorado river as its n. boundary; 915 sq.m.; pop. '80, 1533. Stock-raising is followed by the inhabitants more than agriculture, though the bottom-lands along the Colorado are fertile.

McCULLOCH, BEN, 1814–62, b. Tenn.; took part in the struggle for Texan independence, and distinguished himself in the Mexican war. In 1853 he was made a U. S. marshal, and in 1857 commissioner of Utah. He was a brig.gen. in the confederate service during the civil war, and commanded in several engagements in Missouri. He was killed at the battle of Pea Ridge.

M'CULLOCH, HORATIO, a Scottish landscape-painter, was b. in Glasgow in 1806, and named after lord Nelson. His first intention was to fit himself for being a manufacturer, but finally he devoted himself entirely to art. He exhibited for the first time in 1829. In 1836 he was elected an associate of the Scottish academy, and next year he fixed his residence at Hamilton, and made enthusiastic studies of the oaks in Cadzow Forest. Two years afterwards, when he was elected a member of the Royal Scottish academy, he removed to Edinburgh, where he lived till his death in 1867. M'Culloch headed the roll of the contemporary Scottish landscape-painters. He painted the Highlands with unrivaled truth, breadth, and imagination. Among his principal pictures are "Highland Loch," "Loch-an-Eilan," "View in Cadzow Forest," "Dream of the Forest," "Misty Corries," "Deer Forest, Isle of Skye," "Loch Achray," "Mist Rising off the Mountains," "Kilchurn Castle, Loch Awe," and "Bothwell Castle, on the Clyde."

McCULLOCH, HUGH, b. Me., 1811; studied at Bowdoin college, but on account of ill health did not graduate; in 1833 he removed to Fort Wayne, Ind., and entered upon the practice of law. In 1855 he was made president of the Indiana state bank, where he had been employed since 1835, which position he held for eight years, gaining a more than local reputation as a skilled financier. In 1863 secretary Chase, of the treasury, called him to Washington to take charge of the newly created bureau of the currency, and appointed him comptroller of that department. In Mar., 1865, McCulloch succeeded Fessenden as secretary of the treasury at the request of president Lincoln, and held that position until Mar., 1869. The derangement of the finances occasioned by the rebellion and by the very large issue of legal-tender notes and national bonds gave rise to many difficult questions to be decided by the head of the treasury department. Mr. McCulloch was an earnest advocate of specie resumption at the earliest possible moment, and a firm friend of the national-bank system as uniform and safe. For the greater part of his term of office he was in opposition to congress on the subject of retiring the legal-tender notes, arguing that the "best way to resume is to resume." The fear of contraction was very great, and it was thought that business interests would suffer from haste in the matter. Though McCulloch has since acknowledged that in some details of his scheme he was mistaken, the general principles he advocated have been proved correct by subsequent events. In 1869 he retired from the treasury, became a member of the firm of Jay Cooke, McCulloch & Co., London, and has since been engaged in banking in that city.

MACCULLOCH, JOHN, a geologist and physician, b. in Guernsey, of a Scottish family, Oct. 6, 1773. He studied and took the degree of doctor of medicine in Edinburgh, and was appointed assistant-surgeon to an artillery regiment. In 1811 he was employed by the government in geographical and scientific researches in Scotland. In 1820 he was

appointed physician to prince Leopold, of Saxe-Coburg, now king of the Belgians; and in the latter years of his life was professor of chemistry and geology in the East India company's military school at Addiscombe. He died at Penzance, Cornwall, Aug. 21, 1835, in consequence of an amputation rendered necessary by an accident. His most important works are a *Description of the Western Islands of Scotland* (3 vols., Lond. and Edinb. 1819); *A Geological Classification of Rocks, with Descriptive Synopses* (Lond. 1821); *A System of Geology, with a Theory of the Earth* (Lond. 1831); *Malaria—an Essay on the Production and Propagation of this Poison* (Lond. 1827); and *An Essay on the Remittent and Intermittent Diseases* (2 vols., Lond. 1828).

M'CULLOCH, JOHN RAMSAY, b. at Isle of Whithorn, Wigtonshire, in 1789, a distinguished political writer, and the foremost among our political economists, first became known in connection with the *Scotsman* newspaper and the *Edinburgh Review*. He came forward as a contributor to the former soon after its establishment in 1817; and for a considerable time was its editor. He made his *début* in the latter in 1818, by contributing to it an article on Ricardo's *Principles of Political Economy*, and continued for about 20 years to write pretty regularly for the *Review*, having contributed almost all the economical articles that appeared in it during that period, with a few on other subjects. M'Culloch, however, is best known by his numerous works published in the course of his life, which are remarkable for the scientific spirit in which they are written, their practical good sense, and the clearness and directness of their style. By these he has done more to establish and popularize the doctrines of political economy than perhaps any other writer. His principal publications comprise: *A Discourse on the Rise, Progress, Peculiar Objects, and Importance of Political Economy; The Principles of Political Economy, with some Inquiries respecting their Application, etc.; The Literature of Political Economy, etc.; Treatises and Essays on Money, Exchange, Interest, the Letting of Land, Absenteeism, etc.; A Treatise on the Succession to Property vacant by Death, including Inquiries into the Influence of Primogeniture, Entails, etc.; A Treatise on the Circumstances which determine the Rate of Wages and the Condition of the Laboring Classes; A Dictionary, Practical, Theoretical, and Historical, of Commerce and Commercial Navigation; Statistical Account of the British Empire; Geographical Dictionary; A Treatise on Taxation and the Funding System, etc.* Most of these works have gone through several editions. A third edition of the work on taxation, which appeared in 1863, was the last work of the author, and was nearly re-written. M'Culloch also published various occasional tracts and notices, some of which had a very wide circulation. His edition of the *Wealth of Nations*, with an introductory discourse and notes, and his collected edition of the works of Ricardo, deserve to be ranked among the most important services which he rendered to his favorite science. Towards the close of his life he edited two volumes of scarce economical tracts for the political economy club, and four volumes of the same class of tracts for lord Overstone. In 1828 M'Culloch was chosen professor of political economy in University college, London; but having resigned that chair, he was subsequently (1838) appointed comptroller of her majesty's stationery office, a situation which he held till his death, and in which he is understood to have effected various important reforms. M'Culloch was a foreign associate of the institute of France; and he enjoyed a pension of £200 a year, conferred upon him by the late sir Robert Peel. He died Nov., 1864.

McCURDY, CHARLES JOHNSON, LL.D., b. Conn., 1797; educated at Yale, and called to the bar, where he took a high position. He was several times chosen to the legislature, of which he was speaker for three years. In the years 1845 and 1846 he was lieutenant-governor of the state. He was appointed by Mr. Fillmore minister to Austria in 1851; and from 1856 to 1867 he was an associate justice, first of the superior, and afterwards of the supreme court of Connecticut.

McDONALD, a co. in s.w. Missouri, having Arkansas on the s., and Indian territory on the w.; 475 sq.m.; pop. '80, 7,816. It is a fertile region, the surface undulating; productions, wheat, Indian corn, oats, Irish and sweet potatoes, cotton, tobacco, and butter. Co. seat, Pineville.

McDONALD, CHARLES J., 1793–1860; b. S. C.; settled in Georgia, where he was admitted to the bar. He was a judge of the state circuit court in 1825, a member of the state senate in 1837, and governor 1839–43. From 1857 till his death he was an associate justice of the state supreme court.

MACDONALD, ETIENNE JACQUES JOSEPH ALEXANDRE, duke of Taranto, marshal and peer of France, was b. Nov. 17, 1765, at Sancerre, in the department of Cher. He was descended from a Scotch family which followed James II. to France. Macdonald embraced the cause of the revolution, entered the army as a lieut., and rapidly rose to high military rank. In 1798 he was intrusted with the government of the Roman states, but was compelled to evacuate them by the superior force of the enemy. In 1799 he defeated the Austrians at Modena, and was defeated on the Trebbia by a superior Austrian and Russian force under Suwarrow. As commandant of Versailles, he rendered very important service to Bonaparte in the revolution of 18th Brumaire; and in 1800 and 1801 he chased the Austrians from Switzerland and the Tyrol; but after honorably filling some important political posts, he lost the favor of Bonaparte by his honest support of the cause of Moreau. In 1809 he was summoned by the emperor to

take the command of the right wing of the army of Italy under Eugène Beauharnais, and took Laibach. He greatly distinguished himself at the battle of Wagram, and on the field of battle became reconciled to Napoleon, who, for his services on that day, created him marshal and duke. He held a command in Spain in 1810, afterwards in the Russian campaign; in 1813 he defeated the Prussians at Museburg, and contributed to the success of the battles of Lutzen and Bautzen, but was subsequently defeated by Blücher at the Katzbach. After the battle of Leipzig he was employed in covering the retreat of the French army, and saved himself only by swimming the Elster. In the subsequent struggles on French ground between the Marne and Seine, Macdonald made desperate efforts; but when he saw that further resistance was hopeless, he advised the emperor to abdicate. The Bourbons made him a peer, and gave him the command of a military division; and on Napoleon's return from Elba, it fell to his lot to oppose his progress to Paris. All his troops went over to Napoleon, but he himself accompanied Louis XVIII. in his flight; and although he returned to France, he refused to serve during the hundred days. After the second restoration he was continually loaded with honors of every kind, but consistently maintained, in the chamber of peers, the principles of constitutional liberty. He died at his seat of Courcelles, near Guise, Sept. 24, 1840.

MACDONALD, FLORA, a Scottish heroine, 1720–90; b. in the island of South Uist, one of the Hebrides. When the pretender, Charles Edward Stuart, after the battle of Culloden, in 1746, fled and was pursued by the king's troops, he was rescued by the exertions of Flora, and conducted by her disguised as her female servant to the isle of Skye. They were assisted by lady Macdonald, who committed them to the care of Macdonald of Kingsburgh. A reward of £30,000 was offered for the prince. When the act of Flora became known she was arrested, and, after being kept five months on various vessels of war, she was sent to London, but soon discharged under the indemnity act of 1747. In 1750 she returned to Scotland, and was married to Allan Macdonald of Kingsburgh. They emigrated to America in 1774, and settled in Fayetteville, N. C. In the revolutionary war Macdonald took the part of the British, and served in the army. Flora returned to Europe alone, but was soon joined by her husband. Her four sons entered the British army.

MACDONALD, GEORGE, b Huntley, Scotland, 1824; educated at King's college and Aberdeen university, and studied for the ministry at the Independent college in Highbury, London. He was for some years a Congregational minister, but, quitting the ministry, he removed to London and devoted himself to authorship, in which he has attained a high position as a novelist and poet. In 1872–73 he visited the United States, chiefly on a lecturing tour, but preaching in a few pulpits. His first book, *Within and Without*, a dramatic poem, appeared in 1856, and among his later publications are: *David Elginbrod*, 1862; *Annals of a Quiet Neighborhood*, 1866; *Robert Falconer*, 1868; *Wilfrid Cumbermede*, 1871; *Malcolm*, 1874; *The Marquis of Lossie*, 1877; *Sir Gibbie*, 1879; and *Mary Marston*, 1881. He has written also on theological subjects, and his novels have much theology and practical religion. His thought is original and vigorous, while he is master of a clear and elegant style.

MACDONALD, Sir JOHN ALEXANDER, D.C.L., b. Canada, 1815; was called to the bar in 1835, and was returned to parliament in 1844 as conservative member for Kingston, which city he has continued to represent. In 1847 he became a member of the executive council and receiver-general, and later in the same year commissioner of crown lands. He was in opposition 1850–54, and in the latter year entered a coalition cabinet as attorney-general, holding office till 1862, when the ministry, upon the defeat of their militia bill, resigned. In 1864 he entered the cabinet of sir E. P. Tache as attorney-general. A coalition was now formed between the leaders of the government and the opposition on the bill to unite all British America under a federal government. In 1865 sir John became minister of militia; in 1868, minister of justice and attorney-general; and in 1869 premier in the Dominion cabinet, going out of office in 1873. He formed another cabinet in 1878, taking himself the post of minister of the interior.

McDONNELL, Sir RICHARD GRAVES, LL.D., b. Ireland, 1815; educated at Trinity college, Dublin, and called to the Irish and afterwards to the English bar. He was made chief-justice of the Gambia district, Africa, in 1843, and governor of the British settlements on the Gambia in 1847. In the latter capacity he conquered a number of hostile native tribes, and explored a considerable portion of Africa from the Gambia to the Senegal. In 1852 he became governor of St. Vincent, and in 1855 governor-in-chief of South Australia. He was appointed lieut.gov. of Nova Scotia in 1864, and was governor of Hong-Kong, 1865–72.

McDONOUGH, a w. co. in Illinois; 576 sq.m.; pop. '80, 27,985. The surface presents an undulating appearance, and is chiefly fertile prairie land. It is drained by Crooked creek, and intersected by the Chicago, Burlington and Quincy, and the Toledo, Peoria and Warsaw railroads. The productions are wheat, rye, Indian corn, oats, wool, butter, and potatoes. There are a large number of flour and saw mills, and manufactories of carriages and saddlery and harness. Co. seat, Macomb.

McDONOUGH, THOMAS, 1783–1825; b. Del.; became a midshipman in 1800, and three years later was on the frigate *Philadelphia* in Preble's expedition against Tripoli; he was also attached to the schooner *Enterprise* under Decatur, and was one of the party which recaptured the *Philadelphia* from the Tripolitans in 1804. He was made a lieut. in 1807, and a master-commandant in 1813. On lake Champlain, in 1814, he defeated the English fleet under commodore Downie. At the time of his death he commanded the Mediterranean fleet.

McDOUGAL, DAVID D., b. Ohio, 1809; entered the navy, 1828; made lieut. in 1841, and commander in 1857. While in command of the *Wyoming* in 1863, he fought off the coast of Japan (with six Japanese batteries firing on him) three ships of the Japanese navy, and succeeded in defeating them. He was made commodore in 1869, and was retired in 1871.

McDOUGALL, ALEXANDER, 1731–86; b. Scotland; a printer, and in 1770 sentenced to imprisonment for libeling the provincial government of New York, where his father had settled in 1755. He served through the revolutionary war with distinction, became a maj.gen., and took an active part in the battles of Germantown and White Plains. From 1778 to 1780 he was in command of the forts along the Hudson, and in 1781 was elected to congress.

McDOUGALL, JAMES A., 1817–67; b. N. Y.; began the practice of law in Illinois in 1837, and was state attorney-general in 1842 and 1844; settled in San Francisco in 1849, and the next year was elected attorney-general of California. He was a democratic member of congress, 1853–55, and U. S. senator, 1861–67; in the latter body acting as chairman of the Pacific railroad committee, and belonging to that section of the democratic party known as "war democrats."

McDOWELL, a co. in w. North Carolina, bounded on the w. by the Black mountains; 550 sq.m.; pop. '80, 9,836. The valleys are fertile, and produce wheat, rye, Indian corn, oats, Irish and sweet potatoes, wool, and butter. Co. seat, Marion.

McDOWELL, the extreme s. co. of West Virginia, on the border line of Virginia, watered by a fork of the Sandy river; 900 sq.m.; pop. '80, 3,074. It is mountainous in the s. and e. parts. The productions are: Indian corn, oats, Irish and sweet potatoes, tobacco, butter, and wool. Co. seat, Perrysville.

McDOWELL, EPHRAIM, 1771–1830; b. in Rockbridge co., Va.; attended medical lectures in Edinburgh in 1793–94; settled in Danville, Ky., in 1795, and became the leading practical surgeon in several states. He performed the first operation recorded in this country in ovarian surgery at Danville, in Dec., 1809. A report of this and of other cases, from the pen of the operator himself, appeared in the *Eclectic Repertory and Analytic Review* in 1816. He was skillful in every branch of the surgical art, having cut no less than 32 times for stone in the bladder without losing a single case.

McDOWELL, IRWIN, b. Columbus, Ohio, 1818; was educated partly at a French military school, and afterwards at the military academy of West Point, where he graduated in 1838, remaining there until 1845, in the service of the government. He served in the war with Mexico, and was brevetted a capt. for good conduct at the battle of Buena Vista. After the close of the war he acted as assistant adjt.gen., being assigned to duty in various departments until 1858, when he occupied a year's leave of absence in visiting Europe. In 1861 he was in Washington, and at the outbreak of the rebellion was employed in organizing the volunteer troops. He was commissioned brig.gen. U. S. army, May 14, 1861, and on May 27 was appointed to the command of the army of the Potomac, of which army he was the head during the disastrous defeat at Bull Run, July 21. On being superseded in this command, he was placed in charge of the defenses of Washington, but Mar. 14, 1862, was commissioned a maj.gen. of volunteers, and given a corps command in the army of the Potomac. He served in northern Virginia, and at the second defeat of Bull Run. During the last year of the war he was employed on court-martial duty, and in command of the department of the Pacific. In 1865 he received his brevet of maj.gen. in the U. S. army, and the following year was mustered out of the volunteer service. He has since been commissioned maj.gen. U. S. army, and has commanded the departments of the east, the south, and the Pacific, being still (1881) in the latter command.

McDUFFIE, an e. co. in Georgia, having the Little river for its n. boundary, and intersected by the Georgia railroad; 350 sq.m.; pop. '80, 9,449. The surface is varied, generally heavily timbered, and the soil is fertile. Co. seat, Thomson.

McDUFFIE, GEORGE, 1788–1851; b. Ga.; graduated at South Carolina college, entered the bar in 1814, and was chosen a member of the South Carolina legislature in 1818. In a duel arising out of a political dispute he received a wound, from the effects of which he never fully recovered. From 1821 to 1834 he was a member of congress, where he opposed internal improvements and the protective tariff, and in his capacity as chairman of the ways and means committee, defended the U. S. bank. In his earlier public career he had been an advocate of a centralized government; but in congress, following the general sentiment of his state, he advocated states rights, and was one of the ablest defenders of the right of nullification during the controversy between the federal gov-

ernment and South Carolina, which had its immediate cause in the hostility of the latter to a high protective tariff, and was carried on from 1820 to 1832. In 1835, having resigned his seat in congress, he was elected governor of South Carolina; and he was a U. S. senator from 1843 to 1846, when ill-health compelled him to resign.

MACE, the aril (q.v.) of the nutmeg (q.v.). In the fruit it is situated within the fleshy part, and envelops the nut. It is a lacerated membrane, blood-red, and somewhat fleshy when fresh. It is prepared for the market by drying for some days in the sun, and flatteuing. It has a peculiar, strong, agreeable smell and taste, and contains a clear, yellow, volatile oil, and a red, buttery, fixed oil. The volatile oil is obtained from it by distillation. The buttery oil, obtained by expression, mixed with the volatile oil and other substances, is known as nutmeg balsam. Mace is used as a spice, and has much of the flavor of the nutmeg. It is of a bright orange-yellow color, and has a peculiar wax-like texture. It is imported chiefly from Penang and Singapore, where it is received from the Spice islands. Small quantities are sent also from the West Indies, where its cultivation receives some attention. There used to be about 120,000 lbs. annually imported into Britain, of which 90,000 lbs. were re-exported; but the import seems to be on the decline, less than 30,000 lbs. having been received in a year. The aril of species of *myristica*, different from the true nutmeg, and coarse and very inferior, sometimes appears in commerce as mace.

MACE, a strong short wooden staff, with a spiked metal ball for a head. It was a favorite weapon with knights, with the cavalry immediately succeeding them, and at all times with fighting priests, whom a canon of the church forbade to wield the sword. No armor could resist a well-delivered blow from the mace. The mace is now borne before magistrates as an ensign of authority.

MACÉ, JEAN, b. Paris, 1815; of a working family, but given a solid education. At 20 he was a teacher of history in the college Stanislas. When the revolution of 1848 brought the republic, he supported the new government with enthusiasm, as one of the editors of *La Republique*. On Napoleon's *coup d'état*, in 1851, he was obliged to leave Paris, and became teacher of natural sciences and literature in a seminary for girls in Alsace. Here he conceived the happy plan of popularizing scientific studies for children, and began by the publication of the *History of a Mouthful of Bread*, or letters to a little girl, explaining, with the interest of a story, the laws of physiology pertaining to digestion. This plan was continued in a series of books published in France which have had a great popularity. In 1863 he joined Hetzel in the conduct of the *Magazin d'Education et de Récréation*. In 1866 he had organized a teachers' league of 30,000 members, which promoted popular education not only through schools, but also through the formation of communal libraries, and by its pressure in favor of free and obligatory education. We translate a few of the titles of Macé's admirable books for children: *Stories of the Little Château; Theater of the Little Château; History of Two Apple Merchants; Servants of the Stomach*—a sequel to the *History of a Mouthful of Bread; The Eye; Letter of a Peasant of Alsace to a Senator; The Separation of the School and the Church;* and *Half Instruction*. The last two works are intended to lay out the work of the teachers' league (*ligue de l'enseignment*) of which Macé is president.

MACEDO'NIA, anciently, the name of a country lying n. of Thessaly. It was originally of small extent, embracing only the district called Emathia, but gradually extended until, in the time of Philip, father of Alexander, it reached, on the n., the Scardian mountains, a portion of the Hæmus (mod. Balkan) range; on the w., the frontiers of Epirus and Illyria; on the e., the river Nestos (mod. Karasu); and on the s., Thessaly. The country is on the whole mountainous, especially in the s. and w., but there are several large plains of great fertility. The principal rivers were called the Strymon, the Axius, and the Haliacmon. Macedonia was famous among the ancients for its gold and silver mines, and its productiveness in oil and wine. It contained a number of flourishing cities, of which the names are well known in ancient history, particularly Pella, the capital, Pydna, Thessalonica, Potidæa, Olynthos, Philippi, and Amphipolis. The Macedonians are believed by some to have been originally an Illyrian race, but this is not probable. Their language, though different from, was yet allied to that of Greece. The singular fact, however, that it employed words not used by the Greeks, but preserved in Latin, would lead us to infer that the ethnological connection between Greece proper and Macedon belonged to an extremely remote period. The Macedonians were certainly not pure *Hellenes*, nor did the ancients so consider them; but we may regard them as ruder members of the Grecian nation, whose early development had been hindered by unknown obstacles. The history of Macedonia is involved in much obscurity till about 490 B.C., when the Persians subdued it, so that the Macedonian king, Alexander I., was compelled to take part with Xerxes in his invasion of Greece. On the retreat of the Persians after the battle of Platæa in 479 B.C., Macedonia again recovered its independence. Under the wise and vigorous reign of Archelaus, who died 399 B.C., it greatly increased in prosperity and power; but after his death, a period of civil wars and contests for the throne ensued, which ended in the accession of Philip II. (359 B.C.), who not only seated himself firmly on the throne, but knew how to develop the resources of his kingdom, and so to direct the warlike spirit of his subjects as greatly to extend his dominions. His son, Alexander III., surnamed Alexander the great (q.v.), brought

half the then known world under his empire; but after his death the Macedonian empire was broken up, and at the end of a period of 22 years of incessant wars, formed into four principal kingdoms under his greatest generals. Macedonia itself fell to the lot of Antipater, after whose death ensued another period of civil wars and contests for the throne, of which the Greeks endeavored to take advantage for the recovery of their ancient independence. But the Athenians having called in the assistance of the Romans against Philip V. of Macedonia, by whom their city was besieged, the Macedonians were defeated by the Romans in the great battle of Cynocephalæ (197 B.C.), and both Greece and Macedonia became subject to the Roman power. Perseus, the successor of Philip, was finally defeated at Pydna (168 B.C.), and adorned the triumph of Æmilius Paulus. An attempt of the Macedonian nobles to shake off the oppressive yoke of the Romans having been also defeated, and the nobles driven into exile, Macedonia became (148 B.C.) a Roman province, in which Thessaly and part of Illyria were included. After the time of Constantine, the country was ravaged by Slavic tribes; by the 7th c., the old semi-Greek Macedonians were extinct; and in the later ages of the Byzantine empire, their place was supplied by colonies from Asia, many of them of Turkish descent.—See Finlay's *Mediæval Greece*.

MACEDONIANS, a party which arose toward the close of the Arian controversy, and took their name from Macedonius, who became patriarch of Constantinople in 341. Their distinctive doctrine was the denial of the divinity of the Holy Ghost. In the early stage of the Arian question, the subject of the Holy Ghost attracted no special notice, being equivalently involved in the great subject of dispute regarding the Son. But when it came to be discussed, the same division of opinions was elicited regarding the Holy Ghost which had already arisen about the second person of the Trinity. Macedonius taught that the Holy Ghost was "subordinate to the Father and to the Son, alike to them in substance, and a creature."—Socrates, *Eccl. Hist.* ii. 46. He had himself been a member of the semi-Arian party, and as such had been deposed by the Arians in 360. His party was a considerable one, no fewer than 36 bishops having appeared attached to it at the council of Constantinople in 381. His doctrine, nevertheless, was condemned in that council, in which also was added to the Nicene creed the special clause by which the divinity of the Holy Ghost is defined. The Macedonians subsisted as a distinct party so late as the time of Theodosius.—They are also called *Pneumatomachi*, or "Adversaries of the Spirit."

MACEDO'NIUS, Patriarch of Constantinople (A.D. 341). See MACEDONIANS, *ante*.

MACEDO'NIUS was nominated bishop of Constantinople by the emperor Anastasius I., about 496 A.D. Because he had subscribed the henoticon, or "decree of union," which the emperor Zeno had issued in 482, the monks of the capital renounced fellowship with him and persistently rejected his advances towards reconciliation. Yet, in accordance with his general mildness, he abstained from treating them severely. About 511, having, by his recognition of the council of Chalcedon, incurred the displeasure of the emperor, he was deposed and banished by him on a charge of heresy and crime. The church in all parts of the empire pronounced this sentence unjust, and Vitalian the Goth, in 514, rose up in arms against it, but without success. Two years afterwards Macedonius was released from exile by death.

MACEI'O, or MACAY'O, a city in the province of Alagôas, in Brazil; pop. 8,000. It has 3 churches and as many schools. The inhabitants are agriculturists, and there is a considerable manufacture of rum. At its port, Jagnará, there is some ship-building, and sugar and cotton are exported.

McENTEE, JERVIS, b. Rondout, N. Y., 1828; devoted himself to the study of landscape painting with F. E. Church; and, in 1858, opened a studio in New York, where he soon obtained a high position among American artists. His principal success was gained in depicting mountain scenery, and by his skill in the treatment of foliage. His style is refined, his brush being handled with delicacy, though vigorously, and he is specially notable for luminous effects. In recent years he has undertaken figure-painting, and has given evidences of ability in this direction, apparently equal to that which has been conceded to him as a landscape artist.

MACERA'TA, a province in e. Italy, in the marches on the Adriatic coast; 1057 sq. m.; pop. 236,994. The Apennines intersect it, and much of the country is mountainous and incapable of cultivation. The valleys and level districts are fertile, and in them large quantities of corn and wine are raised. Capital, Macerata.

MACERA'TA, a walled t. of central Italy, and capital of the province of the same name (formerly a delegation). Pop. 20,000. It is finely situated in the midst of hills, on a lofty eminence, 22 m. s.w. of Ancona, and commands picturesque views of the sea and the Apennines. The streets are straight and well paved, and there are some fine public edifices, including a cathedral with some good paintings, six other minor churches, and numerous conventual establishments. The palazzo comunale, or town-hall, is a beautiful building of the 13th century. Macerata has a university of high repute, and is a center of intellectual and social Italian life. The province contains a pop. '71, 236,719.

MACERS are officers attending the supreme courts in Scotland, appointed by the crown. Their duty is to keep silence in the court, and execute the orders of the courts, if addressed to them. They hold office for life, and are paid by salary.

MACFARLANE, ROBERT, 1734–1804; b. Scotland; educated at Edinburgh and was for a time editor of the *Morning Chronicle*. He published an edition of *Ossian* in the Gaelic, with a Latin translation, and it is said that he was concerned with Macpherson in the production of the Ossianic poems.

MACFARREN, GEORGE ALEXANDER, MUS.D., an English musical composer and essayist of high reputation, son of George Macfarren, a dramatic author and musician. He was born in London, Mar. 2, 1813, and his education was conducted at the royal academy of music, at which institution he became a professor in 1834. As an operatic composer, Mr. Macfarren is the most characteristic representative of the national English school—his aim being to revive the old English music in modern opera. His earliest dramatic work, *The Devil's Opera*, was produced in 1838; *Don Quixote* followed in 1846; and *King Charles II.* in 1849, which first brought out Miss Louisa Pyne in English opera. A cantata, *The Sleeper Awakened*, was brought out at the national concerts in 1850, *Lenore* in 1852, *May-day* in 1856, and *Christmas* in 1860. The opera of *Robin Hood* followed in the same year, which attained a popularity far beyond its predecessors, and was performed during a whole season to overflowing houses. The *opera di camera* of *Jessy Lea* followed in 1863; *She Stoops to Conquer* and *Helvellyn* in 1864. The oratorio of *John the Baptist* appeared in 1873. Mr. Macfarren's works comprise numerous other small dramatic pieces, as well as chamber music, vocal and instrumental, and several symphonies and overtures. He has also contributed largely to the literature of music. His *Rudiments of Harmony* were published in 1860; *Six Lectures on Harmony*, in 1867. In 1875 he became principal of the royal academy of music, and professor of music at Cambridge university, receiving the degree of doctor of music.

MCFERRIN, JOHN BERRY, D.D., b. Rutherford, Tenn., 1807; admitted as a preacher in the Methodist Episcopal church in 1825, and was a missionary for two years among the Cherokee Indians. In 1840 he began to edit the *Southwestern Christian Advocate* at Nashville, which he continued for 18 years; was in 1858 appointed book-agent of the Methodist Episcopal church; in 1866 was made corresponding secretary of the board of missions. He is the author of *History of Methodism in Tennessee*, 3 vols., and assisted in the preparation of *Redford's History of the Organization of the Methodist Episcopal Church, South*.

MACGA'HAN, JANUARIUS ALOYSIUS, 1844–78; b. Ohio; of Irish-American parentage. He commenced the practice of composition when quite young, and entered journalism as a correspondent. In 1868 he visited Europe, and at the outbreak of the Franco-German war was attached to the staff of the *New York Herald*, and accompanied the army of Bourbaki, whose defeat and retreat into Switzerland he described in his letters. He was in Paris during the *Commune* and wrote vigorous and graphic description of the scenes and incidents of the time. On one occasion he was arrested, and was preserved from death at the hands of the infuriated communists only by the intervention of the American minister. During the summer of 1871 he traveled through Europe, and in the autumn was ordered by the *Herald* to Russia, where he remained during the following year. The Russian expedition to Khiva in 1873 was attended by MacGahan in the capacity of correspondent of the *Herald*, despite the positive directions to the contrary of gen. Kaufmann, commanding the expedition. The pertinacity, shrewdness, and good-nature with which the American persisted in carrying his point insured his success; and, though at times hunted by Cossacks under orders to restrain him, he was able to fulfill his engagement, and convey intelligence to the journal employing him that reached the public in no other way. The information which he gained during the progress of this expedition was afterwards published by MacGahan in book-form under the title *Campaigning on the Oxus and the Fall of Khiva*. The latter part of the year 1873 was spent by MacGahan at his home in Ohio and in Cuba; and in the spring of 1874 he was in London, whence he was ordered by the *Herald* to proceed to Spain to report the Carlist outbreak of that year. He joined the army of Don Carlos, and accompanied it for ten months, continuing a voluminous and graphic correspondence with his journal during the progress of the campaign. While in Spain he fell into the hands of the republicans, was mistaken for a Carlist, and again owed his life to the intervention of the representative of his government. In 1875 he accompanied the *Pandora* expedition toward the north pole, organized by the editor of the *Herald* and capt. Allen Young, and on his return published an account of his experiences with the title *Under the Northern Lights*. He now resigned from the employ of the *Herald*, and entered that of the London *Daily News;* and in June, 1876, took his departure to join the Turkish army in the capacity of war-correspondent of that journal. But the progress of this duty soon brought to MacGahan's ears rumors of the commission of horrible barbarities by the Turkish guerrillas (Bashi-Bazouks) in Bulgaria, and he repaired to that country to witness for himself and to the world the truth or falsity of these statements. The horrible evidences of the malignant cruelty which had characterized Turkish warfare in Bulgaria roused in the American feelings of the most intense indignation, and he recapitulated the history of his experiences in the columns of the *Daily News* in language

which awakened the profoundest sympathy on the part of the British public, and, indeed, wherever the terrible story found readers. Concerning the extraordinary series of letters which at this period drew the attention of the civilized world to the columns of the *Daily News*, the following, from the pen of Archibald Forbes, who was long associated with MacGahan, will be read with interest: "MacGahan's work in exposing the Bulgarian atrocities of 1876 produced very remarkable results. As mere literary work there is nothing that I know of to excel it in vividness, in pathos, in a burning earnestness, in a glow that thrills from the heart to the heart. His letters fired Mr. Gladstone into a convulsive paroxysm of revolt against the barbarities they described. They stirred England to its very depths, and men traveling in railway carriages were to be noticed with flushed faces and moistened eyes as they read them. Lord Beaconsfield, then premier of England, tried to whistle down the wind the veracity of the exposures they made. The master of sneers jibed at the "coffee-house babble" that was making the nations to throb with indignant passion. A British official, Mr. Walter Baring, was sent into Bulgaria on the track of the two Americans, MacGahan and Schuyler, with intent to break down their testimony by cold official investigations. But, lo! Baring was an honest man with a heart; and he who had been sent out to curse MacGahan blessed him instead altogether, for he more than confirmed his figures and pictures of murder, brutality, and atrocity. It is not too much to say that this Ohio boy, who three years ago was laid in his all too-premature grave on the shore of the Hellespont, changed the face of eastern Europe." It is stated that, on leaving the unhappy Bulgarians, MacGahan said to them: "Before a year is past you will see me here with the army of the czar." This assurance was verified by the event. Early in 1877 he went to St. Petersburg, and accompanied the Russian column throughout the succeeding war, indefatigable in the pursuit of his professional duties and enthusiastic in the cause which he had taken so much to heart. He was preparing to attend the international congress at Berlin when he was struck down by fever, and died in Constantinople after a few days' illness, June 9, 1878. MacGahan was a type of a class of journalists whose names can be numbered on the fingers of one hand: Russell, Sala, Stanley, Forbes, MacGahan. After them come a long list of names, chiefly American, including Albert D. Richardson, John Russell Young, Eugene Schuyler, Whitelaw Reid, etc., through whose additional labors the art of the newspaper correspondent has become recognized and respected.

McGEE, Thomas D'Arcy, 1825–68; b. Ireland; emigrated to America when 17 years of age, and settled in Boston, Mass., where he contributed to the *Pilot*, of which he became editor. He returned to Ireland in 1845 and remained until 1848, writing for the Dublin *Nation* and interesting himself in the repeal movement. He again crossed the ocean, and for the next 9 years was the editor of the *New York Nation*, afterwards the *American Celt*. In 1857 he changed his residence to Canada, and established *The New Era* in Montreal, being also elected a member of parliament, a position to which he was constantly re-elected until his death. He was also twice a member of the ministry, and for one term president of the executive council. He was a prominent advocate of the movement for the union of the provinces, and drafted the plan on which that was afterwards effected. He opposed the Fenian movement, a fact which is supposed to have caused his death. He was assassinated April 7, 1868, by one Whealen, at the door of his hotel, after a night session of parliament. He was an able journalist, a brilliant public speaker, and the author of a number of important works. Among these are: *History of the Irish Settlers in North America, from the earliest period to* 1850; *History of Attempts to establish the Protestant Reformation in Ireland; Sketches of O'Connell and his Friends; Popular History of Ireland;* and a volume of poems.

MacGEOGHE'GAN, James, 1698–1760; b. Ireland; pursued his studies at Rheims, and taking holy orders became chaplain of the Irish brigade attached to the French army. At the instance of a number of distinguished Irishmen in the French service, he wrote in French a *History of Ireland*, which was translated into English in 1835.

McGILL, John, D.D., 1809–72; b. Philadelphia; emigrated in childhood to Bardstown, Ky.; graduated at St. Joseph's college; practiced law in New Orleans and in Kentucky; studied theology at Baltimore and Rome; took priest's orders in 1830 in the Roman church at Bardstown; preached in Lexington, Ky., and in 1850 was consecrated bishop of Richmond, Va. He took a prominent part in the Vatican council. He is said to have been an able preacher and a distinguished controversial writer.

McGILLIVRAY, Alexander, 1740–93; b. Ala.; son of a Scotch trader named McGillivray, and a half-breed daughter of a French officer. He received a good education at Charleston, and was for a time in mercantile business at Savannah, but soon came back to the Creek Indians, whom he led, on the royalist side during the revolutionary war. At its close he negotiated an alliance between the Creeks and Seminoles, and Spain; and he became an agent of the latter. In 1790 he was a party to a treaty granting a considerable territory to the United States, and was made a brig.gen. and U. S. agent.

McGILLIVRAY, William, LL.D., 1796–1852; b. Scotland; graduated at King's college, Aberdeen, where, and at Edinburgh, he studied medicine. He never took a medical degree, but devoted himself to his favorite study of natural history. In 1823 he

was appointed keeper of the Edinburgh university, and in 1831 curator of the museum of the royal college of surgeons at Edinburgh. In 1841 he was appointed professor of natural history in Marischal college, Aberdeen. His most important works are: *A History of British Birds*, 5 vols., 1837–52; *A Manual of British Ornithology*, 2 vols., 1840–41; and *The Flowering Plants of Great Britain and Ireland.*

MACGILLYCUDDY REEKS, the highest mountains in Ireland, forming a group in the w. of the county Kerry, and rising from the western shores of the lakes of Killarney, to the beauty of which their lofty heath-covered summits add an element of grandeur. The reeks cover an area of about 28 sq.m.; and Carran-tual, the loftiest peak, is 3,404 ft. in height.

McGREADY, JAMES; supposed to have been b. in Pennsylvania about 1760; after being educated at Jefferson college, entered the ministry of the Presbyterian church; labored for a time in North Carolina; in 1796 removed to s.w. Kentucky, where he was prominently connected with a remarkable revival of religion, which continued for several years, leading to the ordination of men to the ministry who had not received a regular theological training. These ordinations led to controversies which culminated in 1810 in the organization of the Cumberland Presbyterian church, a denomination of much strength and influence in Kentucky, Tennessee, and some other states.

McGREGOR, a village of Iowa, capital of Clayton co., on the Chicago, Dubuque and Minnesota railroad; pop. 2,074. It has excellent schools, 6 churches, 2 weekly newspapers, and manufactures of carriages, wagons, etc.

McGREGOR, JOHN, 1797–1857; b. Scotland; after engaging in business in Canada, returned to England and was sent by the government on commercial mission to several states on the continent. In 1840 he was made a secretary to the board of trade, which office he gave up in 1847, to accept a seat in parliament as a member for Glasgow. In parliament as previously he was a supporter of free trade. He was the author of, among other books, *Commercial and Financial Legislation of Europe and America*, 1841; *Commercial Statistics of all Nations*, 1844–50; and *History of the British Empire from the Accession of James II.*, 1852.

MACGREGOR, JOHN, b. at Gravesend, England, 1825; graduated at Trinity college, Cambridge, and entered at the Middle Temple in 1847. In 1849–50 he made a tour of Europe, Egypt, and Palestine, and on his return was called to the bar. He afterwards visited every European country, as well as Algeria, Tunis, the United States, and Canada; was a writer for *Punch* and other periodicals; in 1865 made a canoe voyage, of which he afterwards gave an account in a book entitled *A Thousand Miles in the Rob Roy Canoe on Rivers and Lakes of Europe*, Other voyages of the same kind followed, of which we have record in *The Rob Roy on the Baltic*, *The Voyage Alone in the Yawl Rob Roy*, and *The Rob Roy on the Jordan*, all of which have been widely read.

McGUFFEY, WILLIAM HOLMES, D.D., LL.D., 1800–73; b. Penn.; removed in youth to Ohio; graduated at Washington college 1825; was a professor in Miami university 1836–39; president of Ohio university 1839–45; and professor of moral philosophy in the university of Virginia from 1845 until his death. He was also the compiler of a series of readers and other school books, of which immense numbers were sold.

McGUIRE, HUGH HOLMES, 1801–75; b. Winchester, Va.; graduated in medicine at the university of Pennsylvania, 1821. Was professor of surgery in the Winchester medical college from its organization to its destruction during the civil war. He operated fifteen times for stone in the bladder without losing a case. He was vice-president of the American medical association in 1849.

McGUIRE, HUNTER HOLMES, b. Winchester, Va., 1835; son of Hugh Holmes; was made M.D. in 1855, and professor of anatomy in the Winchester medical college in 1858. Entering the confederate army as a private he soon became director of the 2d army corps of northern Virginia and medical surgeon to gen. "Stonewall" Jackson. Was made professor of surgery in Virginia medical college at Richmond. He has operated for stone in the bladder 47 times since the civil war, and contributed articles to medical journals, and has performed the operation of ligating the abdominal aorta, the patient living 12 hours afterwards. See LIGATURE.

MACHÆRODUS, a genus of extinct carnivorus animals of the feline or cat family, presenting the most specialized example of the carnivorous type known. The upper canines have a most extraordinary development, being long, saber-shaped, with finely serrated margins. The upper jaw has no true molars, and in the under jaw the premolars are reduced to 2 on each side. The dental formula is

$$i.\ \frac{3-3}{3-3};\ c.\ \frac{1-1}{1-1};\ pm.\ \frac{2-2}{2-2};\ \frac{0-0}{0-0} = 26.$$

These formidable flesh-eaters are called "saber-toothed tigers," but some of the species resembled the lion, and are spoken of as lions by some authorities; and were fully the size of the largest of the present *felis leo*. They had a wide distribution in space and time, their fossils being found in Great Britain, in various parts of the continent of Europe, in India and other parts of Asia, and in North and South America, ranging in

time from the miocene formation to the middle of the quaternary, or human age. The bones of *machærodus primæus*, from the Bad Lands of Dakotah indicate an animal somewhat smaller than the American panther; with smaller cranium and orbit, and also described as differing in dental formula from that given above, having 3 upper incisors, and 3 upper premolars on each side instead of 2, making in all 30 teeth instead of 26. There is another larger species from the same locality, but with less perfect remains. *M. cultridens*, from the tertiary of the Val d'Arno is of large size, having upper canines 8½ in. along the anterior curve, while *M. neogæus*; from quaternary caverns of Brazil was still larger, having upper canines projecting 8 in. beyond their sockets. The bones of these animals are often found along with those of several species of quadrumana, and of mammoth deer, bears, horses, elephants, and also various others of their own family, as hyenas, tigers, and extinct lions; in fact, they flourished in the age of mammals, and must have made sad havoc among the more defenseless animals.

MACHÆRUS, a strong fortress of Perea. Josephus says it was originally a tower built by Alexander Jannæus as a check to the Arab marauders. It was on a lofty point, surrounded by deep valleys, and of immense strength both by nature and art. After the fall of Jerusalem it was occupied by the Jewish banditti. The Jews say it was visible from Jerusalem. Its site was identified in 1806 by Seetzen with the extensive ruins now called *Mkrauer* on a rocky spur jutting out from Jebel Attarus towards the n., and overhanging the valley of Zerka Main. Josephus says it was the place where John the Baptist was imprisoned by Herod and beheaded by his order.

McHALE, JOHN, D.D., b. Tubbernavine, Mayo, Ireland, 1791; studied at Maynooth college, ordained priest in 1814, and appointed professor of theology; in 1825 was appointed assistant bishop of Killala; titular bishop in 1834, and archbishop of Tuam the same year. He wrote two series of letters on Roman Catholic emancipation; in 1827 published a treatise on the *Evidences and Doctrines of the Catholic Church*, which was translated into French and German; built a cathedral at Ballina; built or repaired 100 churches in his diocese; established numerous convents and parish schools; preached in Rome in 1831 several sermons which were translated into Italian; in 1848 he went to Rome and obtained from the pope the condemnation of the Queen's college in Ireland; in 1869 he procured from a council of Irish bishops a vote of censure of mixed education. He was a rigid Romanist, earnestly opposed Protestant missionary societies among his flock, and promoted the formation of Roman Catholic schools and colleges. He published Irish translations of 6 books of the *Iliad* and of the *Pentateuch*, and 60 of Moore's Irish melodies in the same meter as the original, with the ancient airs.

McHEN'RY, a co. in n. Dakotah, drained by the Mouse and Cheyenne rivers; 1650 sq.m.; the population of this and four other contiguous counties is given in the census of 1880 at 247. The surface comprises undulating prairie land, varied by large sand hills and buttes.

McHENRY, a co. in n.e. Illinois, on the borders of Wisconsin, drained by the Fox and Des Plaines rivers, and intersected by the Chicago and Northwestern railroad; 470 sq.m.; pop. '80, 24,914. This is a limestone region, having a flat surface, and generally fertile soil. The leading productions are Indian corn, wheat, oats, barley, hay, potatoes, flaxseed, wool, butter, and cheese. Co. seat, Dorr.

McHENRY, JAMES, 1753–1816; b. Md.; was an aid-de-camp to Lafayette in the revolutionary war, member of congress 1783–86, a member of the convention which framed the federal constitution, and secretary of war from 1796 to 1800. Fort McHenry, off Baltimore, is named after him.

MACHIAS, a t. in Maine, near the mouth of the Machias river; pop. '80, 2,203. It was settled in 1763, and incorporated in 1784. The inhabitants are somewhat engaged in the fisheries, and there are a few manufacturing establishments.

MACHIAVEL'LI, NICCOLO. See MACCHIAVELLI, *ante*.

MACHICOLA'TIONS, the apertures between the corbels supporting a projecting parapet. The machicolations are for the purpose of allowing projectiles to be hurled at an enemy when he approaches near the wall, as in scaling, undermining, etc. Such defenses are very common in castellated architecture, especially over gateways, towers, etc.

MACHINE-ENGRAVING has within recent years been introduced for the purpose of superseding, in whole or in part, the manual operations of the engraver. The first step in this direction was the invention of the ruling-machine by Wilson Lowry for the purpose of engraving plain backgrounds, skies, or any other portions where the work was purely mechanical. The saving of labor effected by this instrument was very great, and as its work was performed in a most satisfactory manner, it soon came into very general use. But what is properly denominated machine-engraving is executed wholly by machinery. This department consequently excludes all artistic work, and is generally restricted to the engraving of patterns, bank-notes, etc. For the engraving of bank-notes several machines have been invented, but their mechanism cannot here be described, as, besides being very complex, it is, for obvious reasons, kept secret as far as possible. The Americans have particularly distinguished themselves in this branch of engraving, and, in fact, it is to one of that nation, Mr. Perkins, that the introduction

of the bank-note engraving-machine is due. Perhaps the most perfect machine for engraving is that invented by Wagner of Berlin, and called by him the "universal rose engine, or guilloche machine," which consists of a number of machines capable either of separate or of combined action, the number of distinct instruments being co-extensive with the number of species of lines composing the pattern. The number and arrangement of the different instruments can be so varied that a practically unlimited number of patterns may be obtained, and the correctness and delicacy of these patterns is such as can hardly be surpassed.

MACHINE AND MACHINERY. See MECHANICAL POWERS.

MACHINERY, POLITICAL ECONOMY OF. It has never been questioned that machinery has added greatly to the productive power and the possessions of mankind, and has thus tended to place the poor more nearly on a par with the rich, by enabling them to obtain, at a cheap rate, articles of comfort and luxury of so good a quality as not to be capable of improvement by increase of expenditure. A mischievous fallacy has, however, often taken possession of the uninstructed, to the effect that machinery has a tendency to dispense with hand-labor, and so to benefit the consumer at the expense of the workmen. To clear away this fallacy, it is only necessary to remember that machinery itself must be made with hands; that the capital of a country will not be diminished by the employment of machinery; and that such capital must continue to be employed in paying wages, as of old. It is true that there is a shifting of the parties to whom the wages are paid. When the power-loom was invented, much of the capital that went to hand-weaving was spent on iron and wood for the construction of power-looms. It is a specialty of machinery that it is apt to train the hands to do but one thing, and that thing is liable to fluctuations. The remedy for this is in the working-man not supposing, as he too often does, that he has a right to be employed all his days in one special form of work, but in learning a variety of occupations, or rather learning the faculty possessed by intelligent people of turning the hand to a new function when that is necessary. It is of the more importance to keep this in view that some kinds of manufacture accumulate in certain districts where they can be best executed, and in these there arises a sort of monopoly in the manufacture for the time being, but this monopoly is liable to be broken and affected by many accidents. Thus, the war with America has lately in this way powerfully affected the cotton manufacture, and driven a large body of people either to find another occupation or to become paupers.

MACHINERY, POLITICAL ECONOMY OF (*ante*). The various questions that have from time to time arisen concerning the relation of machine labor to human labor have been entertained generally on a basis of pure speculation, owing to the absence of statistics whereupon to base positive reasoning. Of course, in the consideration of such a subject, the advocates of the largest use of machinery have the advantage. The blessings of the application of power to the reduction of human labor are prominent and undeniable. The multiplication of manufactures through the use of so powerful a force is a fact which cannot be gainsaid. The reduction of the possibilities of art to an automatic basis, thus relieving the individual mind from tension and the individual morality from responsibility, offers attractions. In the face of the absence of statistical evidence to the contrary, the absolute and positive deductions to be made from observation alone are all in favor of the most widespread employment of steam-power and machinery. It has, therefore, been comparatively easy for the advocates of the largest possible expression of mechanical force in manufacture, to formulate statements as argument, strongly sustaining their view of the question, and against which no well-founded objection could be made. Such statements have gradually assumed the character of the following propositions: 1st, that so-called "labor-saving" machinery enables the laborer to save his muscle and improve his mind; 2d, that it lowers the price of luxuries, and makes them measurably attainable by the laboring classes; 3d, that while displacing certain kinds of labor, it creates a necessity for certain other kinds, thus bringing about merely a change of relation and not of existence; 4th, it enables the prosecuting of vast enterprises, involving only the concentration of capital; 5th, it increases the capacity for foreign trade; 6th, it favors the laborer by procuring for him higher wages with greater purchasing power than were possessed by his forefathers. In support of these propositions, those who make them offer evidence which is patent to all as a matter of universal observation. As simple statements, taken by themselves, they are undeniable. Their acceptance involves, also, by a process of inexorable logic, the acceptance of the largest possible increase of mechanical power and machinery as beneficent agents in the constant improvement of the condition of the race.

But exactly here arises the action of a principle which has been fairly enunciated by Bagehot, in his *Physics and Politics*, to the effect that the tendency of reaction in natural law, which becomes potent when this is carried to an extreme, is, first, to bring about an equilibrium of conditions—which is dangerous; and, next, to produce a preponderance in the exercise of force in one direction or another—which is hurtful. The simplest form of expression of this principle is found in the conditions of life and activity as applied to every class of existence, in the threefold movement of growth, maturity, and decay. Its more complicated expression is the result of an abnormal and artificial activity; and this, it has been claimed, is incidental to the over-use of machinery: and the recognition

of this principle, it is claimed, establishes the possibility of such an over-use, and furnishes the first logical argument against the propositions advanced by the advocates of the largest possible employment of machinery. The application of the laws of mechanics to the construction of machinery dates back in positive history to about the 3d c. B.C. There are also hints at the existence of mechanism of various kinds at a much earlier period among oriental nations. It is worth remarking that the discoveries and inventions prior to the middle of the last century were all in the direction of *aiding* mankind in their labors, and that it was not until the first application of machinery to manufactures—in the period between 1690 and 1750—that this condition was changed, and that of *saving* labor contemplated. It is, however, a fact, that in 1618 a patent (number 6) was granted in England to David Ramsey and Thomas Wildgosse, which included in its specifications engines for plowing without horses or oxen, and for raising water to great heights; and a plan for making boats run "as swifte in calmes and more saff in stormes then boats full sayled in Greate Wynes." But of this and other inventions of the 16th and 17th centuries, there was no recorded result of "labor-saving." Half a century ago, Thomas Carlyle discerned a condition whose continued existence has since given occasion for much discussion of the political economy of machinery. Then he wrote: "Cotton cloth is already twopence a yard lower, and yet bare backs were never more numerous among us. Let inventive men cease to spend their existence incessantly contriving how cotton can be made cheaper; and try to invent, a little, how cotton at its present cheapness could be somewhat justlier divided among us." Following him, Thomas Love Peacock, an English author of distinction, wrote as follows: "Ports resounding with life, in other words, with noise and drunkenness, the mingled din of avarice, intemperance, and prostitution! Profound researches, scientific inventions, to what end? To teach the art of living on a little? To disseminate liberty, independence, health? No! to multiply factitious desire, to stimulate depraved appetites, to invent unnatural wants, to heap up incense on the shrine of luxury, and accumulate expedients of selfish and ruinous profusion. Complicated machinery: behold its blessings! Twenty years ago, at the door of every cottage, sat the good woman with her spinning-wheel. The children, if not more profitably employed than in gathering health and sticks, at least laid in a stock of health and strength to sustain the labor of maturer years. Where is the spinning-wheel now, and every simple and insulated occupation of the industrious cottage? Wherever this boasted machinery is established, the children of the poor are death-doomed from their cradles."

Next Emerson sounded a warning note: "A sleep creeps over the great functions of man. Enthusiasm goes out. In its stead, a low prudence seeks to hold society stanch; but its arms are too short; *cordage and machinery never supply the place of life.*"

And then John Ruskin, whose whole lifetime has been devoted to the exposure of error, the annihilation of sham, and the rooting-up of that which was untruthful, wrote in this wise: "If you find in the city you live in, that everything which human hands and arms are able, and human mind willing to do—of pulling, pushing, carrying, making, or cleaning—is done by machinery, you will come to understand what I have never yet been able to beat, with any quantity of verbal hammering, into my readers' heads, that as long as living breath-engines and their living souls and muscles stand idle in the streets, to dig coal out of pits to drive dead steam engines is an absurdity, waste, and wickedness."

It is thus obvious that to certain minds, and these of the deepest and clearest, the accepted and apparently obvious position of machinery in its relation to human labor has appeared to be at least doubtful. And this conclusion is not confined to the minds of statesmen and political economists. The instinct of the laboring-class scented a dangerous enemy from the period of the first application of power to machinery. The history of manufacturing in Great Britain, France, and Germany, from the date of the first intervention of this force, is pointed by constantly recurring periods of antagonism between the laborer and the machine. Between the political economist and the hand-worker there is a wide distance, which was bridged over in this instance by authors in every department of literature, and orators upon every subject. Adam Smith published his *Inquiry into the Nature and Causes of the Wealth of Nations* in 1766, at which date the use of machinery with the application of water-power was prevalent in England. In the work above-named, he says: "The liberal reward of labor, as it is the natural effect, so it is the natural symptom of increasing national wealth. The scanty maintenance of the laboring poor, on the other hand, is the natural symptom that things are at a stand, and their standing condition that they are going fast backward."

This being the fact, the relative condition of wages in connection with the employment and non-employment of machinery becomes an important factor in the question; so also does the relation of the product of machine-labor to capital; and no less the character of the product of machine-labor, as to whether it be of a better quality than that which can be produced by hand-labor. And the further question arises, whether the acknowledged increase of power to export manufactured articles, the result of the extended use of machinery, be economically beneficial to a country. All these points are to be considered—with others—in the endeavor to reach a just conclusion as to the main question. It is interesting to note that each of them has been considered—separately—by men eminent in different departments of learning. By combining conclusions

formed under such circumstances, it is practicable to gain an expression of opinion which cannot fail to be of value.

A few years since, when the balance of trade had first turned in favor of the United States, and shipments to foreign ports, already enormous, were increasing in a ratio quite unexampled, Mr. Edward Atkinson, an acknowledged authority, expressed himself as follows: "The alleged abundance of money consists of loanable capital in cotton, corn, coal, and the like, seeking use. It finds its first expression in the attempt to open foreign markets, *and the strange picture of an excessive shipment to foreign lands, while thousands in this country are insufficiently supplied.* The normal condition has to be reached, in which process the exports in ratio to numbers now excessive may again decline, and the exports and imports become nearly equal—*a condition far more consistent with true welfare.*"

The situation as here pictured, and which is certainly the direct result of the application of comprehensive mechanical power, will be seen to be analogous to that indicated in the passage heretofore quoted from Thomas Carlyle. Again, the multiplication of the possibilities of machinery is claimed, and justly, to have cheapened the cost of manufactured goods, and it is contended that this result is beneficent. An editorial writer in the New York *Tribune*, Aug. 7, 1878, attacked this question after the following fashion: "Go down the streets where cheap shops abound in any American city, and you will see these girls by the hundred flaunting along the sidewalk, with their sleazy dresses made up in the last fashion, their voices loud and defiant, their whole manner drunken with silliness and vanity. It is time we spoke the truth about this class, for it is from among them that the lowest of all classes is recruited every year. The majority of fallen women in this or any American city are not those who have sold their birthright for love, or who have been tempted to their undoing, but these vain, ignorant girls to whom dress and adventure are the wine of life."

Even the manufacture and use of the sewing-machine have not been without their opponents, prominent among these being Thurlow Weed, who alleges that these have resulted "in throwing tens of thousands of poor women out of employment, and affecting the morals of the country alarmingly." A writer in the New York *Times*, a few years since, made the following extraordinary statement: "The use of machinery not only is a fixed fact, but that use is constantly increasing; every person concerned with it, from the inventor who shapes the machine, to the user of it, acts for his own immediate benefit, and never troubles himself about the community; on the other hand, labor is superabundant, *and the question of social order and progress is really the question of the real effect of machinery on labor.*"

This, again, was more than paralleled by an utterance of ex-secretary Boutwell, to the following effect: "Thus faculty, which is a systematic expression of intellectual power, is recompensed, while *mere persons are becoming less important in the economy of labor.*"

And the following, translated from an article entitled *La Crise*, published in a French paper, the *Globe Illustré*, in Philadelphia, in 1877, is still more significant: "An English manufacturer has said and written: 'The insubordination of our working people has caused us to dream of the possibility of doing without them. We have made and encouraged all imaginable efforts of intelligence to fill the places of men by more docile instruments, and we are almost at the end. Mechanics has delivered capital from the oppression of labor. In fact, where we still employ a man, it is only provisionally; waiting the hour when there shall be invented for us the means of performing his duty without him."

Of course the bearing of all of this on the question of the value of machinery as a cause of positive displacement is obvious. The editor of the French paper quoted above thus expresses his view of the probable result of a condition such as that suggested: "What kind of a system is this which suggests delight to the manufacturer in the hope that society can presently dispense with men. Fool! If your workmen cost you something, are they not also your buyers? What will you do with your products, when, disabled by you, these workingmen no longer consume them?"

The ultimate object of an investigation like the one here undertaken is to discern, if possible, whether the net result of the constant increase in the use of machinery be or be not beneficial to the race. The antagonists to this increase, which, as they contend, has arrived long since at a point where it has become hurtful, respond to the propositions in favor of it, already given, as follows: 1st. That experience shows that there is no time gained to the laborer by the intervention of machinery; while on the contrary its employment is such a strain upon the physical and moral nature of those engaged in running it, *ex necessitate rei*, that so far from being enabled to "improve his mind," the machine-worker depraves both body and mind in the mere struggle for existence. It is claimed by those who make this assertion that "the large manufacturing centers are vortices of vice; and that the lives of those who are appendages to mechanism are not only of less duration than the lives of hand-workers, but that such are forced by the nature of their employment to sustain themselves by the free use of stimulants. The drunkenness, immorality, and general degradation of the slaves of the 'labor-saving' machine, as it is employed in manufactures, is patent in every manufacturing town

from Manchester and Sheffield to Lowell and Pittsburg." 2d. They allege that while machinery "lowers the price of luxuries," what were formerly necessities have now become luxuries to thousands by the operation of the same means, and it is manifest that the reduction of the cost of luxuries through the means of machinery to a price *almost* within the reach of the poor, must breed extravagance through added temptation. To that pleasant thing which is quite beyond our reach, we do not aspire; while for that which seems almost within our grasp, we have an insatiable longing. 3d. As to the displacement of human labor through the employment of machinery being apparent, and not real, they point to the constantly increasing prevalence of "tramping" as a business; to the low rate of wages; to the increased employment of prisons and alms-houses; and to the facts as to the capacity for displacement of the mechanical power in use, mathematically presented; and which must be real and not merely apparent in its application, since the means for restoring the balance must needs work so much more slowly. The number of persons in the United States engaged in manufactures by the use of machinery increased between 1850 and 1860, by 37 per cent, and between 1860 and 1870 by 56 per cent, an increase of 93 per cent in twenty years; of course representing, in combination with the quantity of mechanical power applied by each added individual, an amount of displacement quite incalculable. Meanwhile, the application of machinery to agricultural work caused a falling off of the percentage of increase in the number of hands employed, as between the same two decades, of 30 per cent. An illustration of the working of the application of machinery to farm labor in the matter of displacement occurs in the case of the Dalrymple farm in Dakotah, where, the harvest of 1880—cutting 25,000 acres of wheat, employing 20 steam threshing-machines, each with a man and a team, gotten out at the rate of 30 car-loads a day—returned a profit of $250,000, the yield being 35 bushels to the acre. A little reflection on these figures, as to the number of laborers that could be supported from this farm alone, were it worked by hand-labor, will leave a vivid impression as to the displacement in this direction. It is a fact that farming on this scale has not been found profitable in the long run. According to ex-secretary Boutwell, "the tools upon a farm of any given capacity cost at least four times as much as the tools then in use would have cost in 1840." The subject of displacement is entertained by the same authority, in general terms, as follows: "The steam power of England represents, stands for, is equal to, the muscular force of a hundred million full-grown men." It is further contended for this side of the argument, that the tendency of the use of machinery is to the displacement of intelligent and skilled hand-labor, and that its employment involves a comparatively unintelligent and monotonous application to a purely mechanical vocation. As was said in an editorial article upon this subject in a leading New York journal, speaking for machinery, and on the labor-saving nature of its work, "I will do this for you and save your muscles; do you wait on me, make me, and carry what I produce." But the press has not infrequently reached conclusions adverse to the doctrines held by the advocates of the largest possible use of machinery. An editorial article in the New York *Herald* thus expressed such an opinion: "Ninety per cent of our people can, with the machinery we Americans use, produce all that the whole people can consume. That means that 36,000,000 can produce all that 40,000,000 can use, and that, unless we re-establish our foreign commerce, 4,000,000 at least must remain idle, and are condemned to beggary or starvation." This was written when the balance of trade was against the United States: a reference to the citation from Mr. Atkinson heretofore given will show that an extension of foreign commerce did not remedy the evil. But the chief significance of the *Herald* statement rests in its presentation of the percentage of displacement. Thurlow Weed is responsible for the assertion that the increase in the use of machinery in the prosecution of farm-work "has thrown hundreds of thousands of men out of their ordinary employment." The N. Y. *Evening Post* of April 29, 1878, said, "The average daily wages earned by 2,042,209 working-men, as shown by the last census of 100 cities of America, was only 97 cents, and each had an average of only 180 days' employment a year." In 1850 the average annual wages of operatives in all manufactures, including mining and fishing, in the United States was $247, the net average product per capita $230, and the ratio of wages to gross product 22½ per cent. In 1860 these relations had changed to the following: average wages $288; average product $308; ratio of wages to gross product 20¼ per cent. In 1870 the decline of wages in these relations still continued, the average wages being $383, the average product, $392; ratio of wages to gross product 19½ per cent. Now, while the average wages in these industries combined was in 1870 $383 per annum, in manufactures alone it was $288, and in mining alone $482; while the ratio of wages to gross product in the latter industry was 48.75 per cent. And this clearly shows that as the laboring-man avoids connection with machinery his wages increase: the pay of hands engaged in copper-mining in the United States in 1870 was 67 per cent greater than that of operatives in the manufacturing industries. Carroll D. Wright, chief of the Massachusetts bureau of statistics, presented in his annual report for 1875 the figures resulting from an examination into the condition of 397 families of working-men in that state. By these it is shown that the wages (earnings) of these working-men varied between $221

for a day laborer, and $980 for an iron-roller per annum. Of these the highest earnings were those of blacksmiths, brick-layers, teamsters, carriage-smiths, etc., those who worked without the aid of machinery.

It is interesting to note by the foregoing statistics that with the increased use of machinery between 1850 and 1870 there was a steady relative decrease in the receipts of manufacturing operatives in relation to the net product per capita. Yet, as will be shown hereafter, while the operator lost, the capitalist did not gain. The same difference between the amount of wages of manufacturing operatives and those engaged in mining is found existing in Great Britain as in the United States. There mining wages average $375 per head, while those in manufacturing industries vary between $175 and $200. A further example of this relation is found in the fact that 167,000 persons employed in manufacturing machinery in English factories receive only an average of $4 per capita per week, while men engaged in ship-building get $1 per day. Again, in 1870 there were 5,404 hands employed in copper-mining in the United States, of whom 3,247 worked under ground; the average wages of these hands was $5 per capita. With regard to this whole matter of wages, however, it is only fair to take into consideration the purchasing power of money at different times. The authoritative statement of the superintendent of the census (1870) concerning this subject should certainly be received with respect. Bearing in mind that the estimates of wages given in this paper reach no later than 1870, attention is requested to the following: "After much thought, and extensive inquiry on the subject, the superintendent is disposed to regard 56 per cent as a just statement of the increase in price for all classes of mechanical and manufactured productions between 1860 and 1870." And while prices increased 56 per cent during the decade given, wages increased only 33 per cent ($288 in 1860; $383 in 1870). It may be mentioned, also, that while the wealth of the country, the capital invested in manufactures, and the gross annual yield of that capital, have all doubled in periods of eleven years, the wages of the operative have increased only 52 per cent in twenty years.

These figures, it is contended by those whose argument we are now presenting, tend to show that the over-use of machinery in manufactures reduces wages. Of course, general high wages cannot occur during a period of displacement. Mr. David A. Wells has stated that "the labor of 225 persons (with the aid of the improved machinery in use) is as effective in 1876, in meeting the demands of the country for cloth and food products, as was the labor of 691 persons in effecting similar results in 1838; and as a consequence of this change in the power of production, the labor of 466 other persons has within this time and within the special industries under investigation, been rendered unnecessary; and they have been compelled to enter into relations with new wants and new capabilities of purchase in order to find employment." But, on examining other spheres of employment, we are met by the same state of things, with the ratio against the laboring-man, if anything, enhanced. Thus, we learn from Mr. Wells, that, in the stove manufacture, "3 men can now, with the aid of machinery, produce as many stoves as 6 men unaided could have done in 1860;" also, that in the manufacture of straw goods, through the sewing-machine, 300 hands do more than 1000 could have done a few years ago. Again, Mr. Wells says: "In the manufacture of boots and shoes, 3 men working with machinery can do at present what, prior to 1860, required the labor of 6 men to effect, *while the individual or per capita consumption of boots and shoes in the United States has probably been more uniform during the same period than is the case with any other commodity.*" This last statement is important in showing that there is no abnormal or even healthy increase in the demand for boots and shoes, to compensate for the displacement effected by machinery; this, too, being one of the largest and most important of our manufacturing industries. Mr. Wells further states (quoting the census of 1870) that, "while the gain in the population in the United States from 1860 to 1870 was less than 23 per cent, the gain in the product of our so-called manufacturing industries during the same period, measured in kind, was 52 per cent, or nearly 30 per cent in excess of the gain in population."

Consulting further, on the subject of "displacement," Mr. Carroll D. Wright's admirable report (1877) on the statistics of Massachusetts, we are told that, by the mere *improvements* in machinery since 1845, the productive power of the shoemaker has been trebled, while in 10 years the productive power of the woolen manufacturer has been nearly doubled. According to Mr. Wright the total of steam and water power employed in Massachusetts in driving machinery is equivalent to the hand labor of 1,912,488 persons—the actual hand-labor in use being 266,339 persons in 1875. Here we have an admitted displacement of more than 1,600,000 persons; each hand-laborer having his powers multiplied by 6, through the agency of steam and water (and machinery). But, says Mr. Wright, "the industries of Massachusetts, without the aid of her motive power, would require a population of 7,400,000, or nearly 4½ times as great as it is now, to furnish the hand-labor necessary to carry them on." The ratio, however, according to this authority, differs in the following industries as given: In paper-making, each operative (plus machinery) represents the hand-labor of 18 persons. In the textile manufactures, the relation is 1 to 9. Each lumber-maker represents the power of 50 men. The statement as to the woolen manufacture would be incredible coming from any less authoritative source; 283 *operatives in* 1875, *added to the number*

employed in this industry in 1865, *produced very nearly double the quantity of cloth of the former number—a relation of* 1 *to* 70 *persons as regards displacement.* In 1810 the entire manufacture of carpets in the United States amounted to only 10,000 yards. In 1870 there were 689 carpet manufactories in the United States, employing 13,000 persons, at an average wage of $361 per annum, and producing carpets to the value of $22,000,000 annually. The rate of displacement in carpet manufacture through the use of the power-loom is as 1 to 3 in 2-ply ingrain carpets, and 1 to 9 in tapestry and Jacquard Brussels—this ratio being in regard to the number of yards produced, in comparison with the rate of production by the hand-loom. That is to say, 13,000 persons with power now manufacture what it would require 117,000 to make with the hand-loom.

Says Benson J. Lossing—a close and accurate compiler, and careful observer as well: "Extravagance in dress has become more marked since the civil war than at any time in the history of our country. It is not so much extravagance in taste as extravagance in cost. A fashionable woman now expects 4 or 5 new bonnets each year, costing $25 to $50 each; and some on which rich and rare laces are used may cost $200. Forty to one hundred and fifty dollars are now charged, sometimes, for the making and trimming of a single dress, in addition to the cost of the body material. Only by the use of the wonderful sewing-machine, that does the work of scores of nimble fingers in the same time, could the needle-work on the dresses of women now, even the plainest that are in fashion, be performed." The number of sewing-machines manufactured in the United States in 1874 was 528,503; in the four years preceding the centennial exhibition, the sales of this article averaged half a million a year. The entire sales of the American sewing-machine during the last 25 years are estimated to have numbered as many as ten million machines. The number of patents granted in the United States on sewing-machines and parts of machines since 1842 exceeds 1000, while there are more than 40 separate parts of the article, each of which has been the subject of a patent. The use of the sewing-machine, when compared with hand-sewing, is probably in the relation of 1 to 6; a displacement of the work of 5 persons for every machine used. The relation of machinery in the manufacture of watches to hand-labor is as 1 to 3½. Mr. Edward Atkinson mentions that a factory that uses 2,400 bales of cotton in a year, employs 300 to 500 working-men in the field; whereas in the mill it only employs 100 men, women, and children.

In 1856, M. Leplay, writing on the subject of labor in France, characterized the condition of things in a certain district by stating that the position of its manufactures —"ruined by machinery, had driven the working-people of the district to subsist on public charity. In witnessing the marvels of industry produced at the cost of so much suffering," the author demands "*Whether progress thus realized be not actually decay?*" The following pertinent remarks on this subject occur in an address of hon. Hugh McCulloch, July 4, 1878, at Woodstock, Conn.: "Idleness, especially enforced idleness, brews mischief and is dangerous to the state. Honest employment promotes virtue; idleness vice. Manual labor is reputable, although in no country is it properly respected. Laboring-men, as a class, are honest men. . . . . It is work that so many idle men—idle not through their own fault, but idle by the substitution of machinery for hands—are begging for, that families are starving for. . . . . It is not strange, therefore, that the laboring-man looks upon labor-saving machinery and implements as his enemies; and it is by no means certain that they are not. Looking at the labor question as humanitarians regard it, it is, indeed, questionable if labor-saving machinery is not working against the security of society and the welfare of the race. Political economists do not take this view of it. They care nothing for instrumentalities. They look only to results, and to results in a particular direction—the increase of the national wealth—as if the greatness of a nation consisted of its wealth alone, and not in the character and condition of its people."

We recur to the propositions of the friends of machinery. 4th. "It enables the prosecuting of vast enterprises, involving only the concentration of capital." This, as a simple statement of fact, is not disputed. The construction and consolidation of railroads; the foundation of vast manufacturing industries; the supplying of enormously increasing populations (to a certain extent) with the necessaries of life; and the providing of a smaller and more fortunate number with its luxuries,—these are demonstrable incidents which may be fairly included among the uses of machinery. But other questions occur; and when the investigator is met by the assertion that only 2 per cent of the business houses of the United States avoid bankruptcy; when it is known that nearly all the older railroads in the country have been at one time or another in the hands of receivers; when factories are periodically shut down, operatives on strike, and blast furnaces out,—it becomes, in the minds of a certain class of investigators, a question whether this consolidation and concentration of capital be not in itself a force reacting to the injury and loss of the very capital thus forced to unnatural uses. The employment of machinery in farm labor has greatly grown during the decade between 1870 and 1880. Comparison in this respect, made prior to 1870, shows some remarkable facts. In 1860 the amount of product (less material) from the capital invested in the manufacturing industries of the country, including mining and fishing, was $854,256,584, being 15¼ per cent less than the capital itself—$1,009,855,715. In 1870 the amount of capital employed had more than doubled (being $2,348,063,198), while the number of hands

employed had increased 56 per cent. Yet the ratio of product to capital in this latter year had fallen 4 per cent, the product, $1,891,575,749, being 19¼ per cent less than the capital. This is certainly a remarkable change in relation, when it is considered that the number of establishments, also, had increased 80 per cent—*a direct and tremendous increase in machinery.* Again, the amount of capital invested in machinery and buildings for manufactures being, as above stated, $2,348,063,198 in 1870: that invested in farming implements and machinery was $336,878,429. The product on the investment in manufactures (less the material used) was $1,891,675,749: that of agriculture was $2,447,538,658. The average product of each farm laborer was $850. The average product of each operative in the manufactures, backed by a capital invested in machinery six times as great as that similarly employed in farming, was $848. Deducting wages and interest on capital in each of these instances:

Manufacturing, share of wages	$377
" " " interest	73—450
Farming, share of wages	300
" " " interest	8—308

—we have a return to the manufacturer of $398 per operative, and to the farmer of $542. But whereas in the one case there is no important diminution of this net product, in the other we have the enormous expenditures for repairing and sustaining the vast organism of machinery involved, and the very large sums annually expended in improved machinery in order to sustain the competition which is a part of the very essence of mechanism. By this time the net return of the capitalist who has invested his money in manufacturing is reduced by a still further percentage below that of the farmer, who also has employed machinery, but has not so abused its use. But giving no consideration to these elements, there is still a difference in the net product per capita employed, as between the farmer and the manufacturer, of more than *one-third in favor of the farmer.*

Still another comparison to display the relation of profits with and without the over-use of machinery. The number of mining hands employed in the United States in 1870 was 154,328, their product $152,598,994, or $988 per capita. Making the same deduction of wages and interest on capital made in relation to agriculture and manufacturing, we have as a result a net annual return per capita of $471, an increase on that of the manufacturer of 10 per cent, *although the miner receives an average of* $483 *wages to the* $377 *of the manufacturing operative.*

Now, as precluding the claim that it is *over-use* of machinery which produces these curious results, it is only necessary to refer to the U. S. census for 1860 and 1870 to establish the following facts. (It is very likely to be generally assumed by the uninitiated that there was no such tremendous addition between 1860 and 1870 to the quantity of machinery previously existing in the country—as the tenor of this paper would seem to indicate. The facts and figures of the construction of machinery during the decade under consideration very clearly demonstrate the inaccuracy of any such assumption.)

In 1860 the amount of capital invested in the manufacture of machinery was	$35,959,068
In 1870 it was	101,183,597
The number of hands employed in 1860 was	41,172
In 1870	83,514
The wages paid in 1860	16,155,416
In 1870	47,866,882
Cost of material in 1860	21,405,673
In 1870	60,423,643
Number of establishments in 1860	1,383
In 1870	2,897
Gross product in 1860	51,887,266
In 1870	138,519,246

Thus it appears that the capital employed, the wages paid, and the material used in manufacturing machinery, had grown in 1870 to three times the amount of these in 1860; while the gross product on this investment had increased two and seven-tenths times during the same decade. *We had* 170 *per cent more machinery in the country in* 1870 *than we had in* 1860.

But now uprise some marvelous phenomena, by which it might be fairly reasoned that the lesson of 1870 should have closed every machine-shop in the land—*in the interest of capital.* There was a falling off in the gross product in this business, of 30 per cent; and in the average net product per capita of each of the hands employed, from $286.80 to $277.14 per annum. Meanwhile the average of wages had increased from $392.38 in 1860 to $573.16 in 1870. So that the operative returned to the capitalist in 1860 37 per cent less than his wages, and in 1870 less than half his wages. Here may properly be quoted the following statement recently made by Mr. Edward Atkinson: "It is in a quick distribution and ample consumption of products, rather than in the amount of accumulated capital, that the welfare of a community lies." The fact that

there may exist and seemingly thrive large business operations involving the employment of great numbers of human beings, hundreds of thousands of horse-power in steam or water, and tremendous capital, proves nothing, either in favor of hiving the human race, concentrating the natural forces, or limiting the movement of the circulating medium. Any large undertaking, once established, will run itself on its own momentum for a long period of time, without the slightest apparent regard for economic laws or scientific methods, and yet may fail at last. In such cases the capitalist, instead of living and saving from the profits of his business, exists merely on the usance of the large sums of money which pass through his hands—all this ending with failures, dishonesty, and general financial disaster.

"5th. It increases the capacity for foreign trade:" this statement is generally answered as already given in quotations from Carlyle and Edward Atkinson, and with the counter-statement that the increase of foreign trade which is fostered at the expense of home consumption cannot be healthy. The fact that American prints are sold on the market at Manchester, Eng., for 6d. per yard, while the same goods are gathering dust on the shelves and counters of stores in the place of their production, for lack of purchasing power in the American people to exhaust the supply, can hardly be esteemed an illustration of good political economy. "6th. It favors the laborer by procuring for him higher wages with greater purchasing power." While even this statement may be accepted as it stands, it is with a proviso that annihilates its value as an adjunct to the argument. And this because of the claim which is set forth and diligently sustained by the antagonists of too much machinery, viz., that the result of machine labor, the quality and character of its product, are so inferior that a great increase of expenditure is required in the direction of manufactured goods, to supply the same necessities which would be fully satisfied by the product of hand labor at a greatly lessened cost; thus rendering nugatory all possible advantage of increased wages (in certain directions), with increased purchasing power. When to this is added the fact of displacement through the concentration of wages in a few hands, it is claimed that the proposition is practically confuted. Says Charles Eastlake in his *Hints on Household Taste:* "But it is to be feared that instead of progressing we have, for some ages, at least, gone hopelessly backward in the arts of manufacture. And this is true, not only with respect to the character of design, but often in regard to the actual quality of the material employed. It is generally admitted by every housewife who has attained a matronly age, that linen, silk, and other articles of textile fabric, though less expensive than formerly, are far inferior to what was made in the days of our grandfathers. Metal-workers tell us that it is almost impossible to procure for the purpose of their trade, brass such as appears to have been in use a century ago. Joinery is neither as sound nor as artistic as it was in the early Georgian era. A cheap and easy method of workmanship, an endeavor to make a show of finish with the least possible labor, and, above all, an unhealthy spirit of competition in regard to price, such as was unknown to previous generations, have combined to deteriorate the value of our ordinary mechanical work." Mr. G. Phillips Bevan, in his admirable *Industrial Classes and Industrial Statistics*, article, "Paper," says: "The making of paper by hand is but seldom practiced now in this country (England), except by a few makers who have a specialty for best writing and drawing paper, the hand-made in these cases being considered superior to the machine-made" (p. 198). Mr. G. W. Smalley, the London correspondent of the New York *Tribune*, in a letter to that journal dated "London, Feb. 25, 1878," on book-binding at the Paris exposition, writes: "Machinery is largely employed, and the use of machinery is fatal. Commercially, perhaps, it is indispensable, but it is none the less destructive to artistic excellence in binding, as in most other things in which art has any share." Again, Mr. Bevan: "For many years the textile industry was carried on in the rural districts only. The power used was water. Water on the hill-sides was irregular in its flow; work was therefore irregular. When the stream was full, work was brisk (we should have called it excessive); when it was dry, the factory hands were employed on the lands, in hay-making, or other like operations. Thus the operatives were farm laborers as well as factory workers, and as manufacturing was not the complicated affair it is now, they were free from many of the evils which afterwards arose from the introduction of steam, and the immense enterprise and energy of our manufacturers." Speaking of the cotton-dust in the mills, he says: "The operatives showed the effect of this dust in their pale, emaciated faces, and in the bronchial irritation from which they constantly suffered, causing cough, anæmia, debility, diarrhea, and other formidable symptoms of pulmonary mischief, including expectoration, in which the cotton fiber was plainly visible by the microscope." "The physical strength suffers much in factories from confined heated atmosphere, loaded with fine cotton fibers, flinty sand, and cutaneous exhalations; the number of gas-lights, each light destroying oxygen equal to one man; transitions from the mills and their irregular temperature to their own dwellings; diet and drinks adapted to a heated employment, and stimulants to soothe an excited, nervous tension; vision always on the move; perception and volition, from the nature of their work, always in action. . . . No doubt factory physique is not good, but it is made worse by factory associates of vice and iniquity." Mr. Bevan adds that a series of questions addressed in 1873 to the certifying surgeons proved beyond doubt the fact of the degeneracy of the factory population.

The conclusion of the opponents of what they deem to be the abnormal employment of mechanism in manufactures may be set forth in the following authoritative statement: The superintendent of the census estimates the loss to the gross product of the wealth of the country to be $604.89 per capita of those not counted as producing (see p. 376 *Ninth Census*, vol. 3). This sum includes wages, and therefore the producing power per capita. The displacement of 3,000,000 of laboring-men by the over-use of machinery would therefore mean a loss to the annual product of the country of more than $1,800,000,000. When there is added to this sum the cost of supporting these 3,000,000 of idle men —say at 25 cents per day per head—we have a trifle over $2,000,000,000 per annum as the amount to be placed to the debit of the country, being, in fact, as much as the entire capital invested in the manufacturing industries of the United States. Against this it is set forth that no evidence has ever shown that there were 3,000,000 unemployed laboring-men at any one time in the United States. Admitting this, the computation as to the amount of existing idleness is open to any one, whenever it may seem desirable to make it. Those rejecting the figures afforded by the leading American journals, hereinbefore quoted, can easily obtain such data as may be procurable and establish results that will satisfy them. The application to these, whatever they may be, of the per capita loss in such a case as estimated by the superintendent of the census of 1870, will be found to be of value. It is evident that this important subject covers an immense field, and embraces a complexity of elements, physical, intellectual, social, and moral. To its solution all these departments must contribute.

MACHRAY, ROBERT, D.D., LL.D., b. England, 1830; graduated at Sidney-Sussex college, Cambridge, 1855; became dean and fellow of his college; vicar of Madingley, near Cambridge, which he resigned in 1865 to enter upon the bishopric of Rupert's Land, to which he had been appointed.

McILVAINE, CHARLES PETTIT, D.D., LL.D., D.C.L., 1798–1873; b. N. J.; son of Joseph, who was U. S. senator from New Jersey; graduated at Princeton, 1816; ordained in the Protestant Episcopal church, 1820, and officiated at Georgetown, D. C.; chaplain to the military academy at West Point and professor of ethics and history, 1825–27; rector of St. Anne's church, Brooklyn, N. Y., 1827–32, and, in 1831, professor of the evidences of revealed religion in the university of the city of New York; in 1832 consecrated bishop of the diocese of Ohio, in connection with which he was also president of Kenyon college at Gambier, 1832–40, and afterwards of the theological seminary there. Among his published writings are *Lectures on the Evidences of Christianity*, 1832, and in many subsequent editions; *Oxford Divinity; The Holy Catholic Church; The Truth and the Life; Valedictory Offering; Family and Parish Sermons;* and contributions to many religious periodicals. His name is held in honor, without as well as within his own denomination, for Christian fervor as a preacher and writer, and for his combined gentleness and strength of spirit.

McILVAINE, JOSHUA HALL, D.D., b. Del., 1815; of Irish Presbyterian descent; graduated at the college of New Jersey, 1837; studied theology at Princeton theological seminary until 1840; pastor at Little Falls, N. Y., 1841–43; of the Westminster church, Utica, N. Y., 1844–48, during which time published *The Tree of the Knowledge of Good and Evil;* of the First Presbyterian church, Rochester, N. Y., 1848–60, towards the close of which years, delivered a course of lectures in the Smithsonian institution at Washington, D. C., on "comparative philology in relation to ethnology;" professor of belles-lettres in the college of New Jersey, 1860–70, in the last of which years published a work on elocution; since 1870 has been pastor of the High Street Presbyterian church, Newark, N. J. While performing the stated duties of these various positions, Dr. McIlvaine has also been a frequent contributor to the *Princeton Review* and the *Bibliotheca Sacra*. He is a brilliant and original thinker, having a forcible and graceful style, and is enriched with a wide range of learning.

McINTOSH, a co. in s.e. Georgia, on the Atlantic ocean, and having the Altamaha river on the s.w.; traversed by the Atlantic and Gulf railroad, and watered by the Sapelo river and Jones's and Doctor's creeks; 550 sq.m.; pop. '80, 6,241. It has a generally level surface and fertile soil; the productions are rice, Indian corn, sweet potatoes, and cane molasses; there is a large lumber interest. Co. seat, Darien.

McINTOSH, JOHN, 1745–1826; b. Ga.; an officer in the war of the revolution with the rank of col., and a maj.gen. of the Georgia militia in the last war with England, 1814–15. After the revolutionary war was over he settled in Florida, then in possession of the Spaniards, was seized by them on the supposition that he had designs against the Spanish government, and imprisoned a year in Moro castle at Havana. On his return he conducted a reprisal against a Spanish fort on the St. John's, opposite Jacksonville.

McINTOSH, JOHN B., b. Fla., 1838; a cavalry officer in the U. S. army in 1861, and actively engaged in the service in the campaigns in Virginia, Maryland, and Pennsylvania from 1862 to 1865. He was promoted to brig.gen., July 21, 1864, and brevet maj.gen. in 1865. At the battle of Opequan he lost a leg. In 1866 he was made lieut. col. of the 46th infantry. He retired from the service July 30, 1870, with the rank of brig.gen.

McINTOSH, LACHLAN, 1727–1806; b. Scotland; a son of John More McIntosh, who came to Georgia with Oglethorpe in 1736. Lachlan entered the mercantile house of Henry Laurens at Charleston, but was afterwards a land surveyor. At the beginning of the revolutionary war he was col. of a Georgia regiment, and in 1776 was made a brig.gen. In 1778 he led an expedition against the western Indians, was present at the siege of Savannah the next year, and was taken prisoner at the capture of Charleston in 1780. After the war he was a member of congress.

McINTOSH, MARIA J., b. Ga., 1803; removed to New York in 1835, and in 1841 published her first work, *Blind Alice*. Of her numerous works we may mention: *The Lofty and the Lowly*, 1853; *Meta Gray*, 1858; and *Two Pictures*, 1863.

McINTOSH, WILLIAM, 1775–1825; b. Ga.; a half-breed, who led the Creek Indians who adhered to the United States in the war of 1812. On account of his share in the treaty of Indian Springs, made in 1825, which granted to the United States large portions of the Indian lands, he incurred the hostility of many members of the Creek tribe, to which his mother had belonged, and was murdered by some of them at his own house.

McINTOSH, WILLIAM, 1796–1858; b. Ga.; an Indian of the Cherokee tribe, who became a Methodist preacher and missionary in Arkansas and the Indian reservation.

MACKARNESS, JOHN FIELDER, D.D., b. 1820; studied at Mereton college, England; fellow of Exeter college, Oxford; vicar of Tardebigge, Worcestershire, 1845–55; rector of Honiton, Devonshire, 1855–58; prebendary of Exeter, 1858; proctor in convocation for the clergy of the diocese of Exeter, 1865; advocated the disestablishment of the Irish church; was made bishop of Oxford, 1869. His brother, George Richard Mackarness, D.D., having been vicar of Ilam, Staffordshire, became bishop of Argyll and the Isles, 1874.

MACKAY, CHARLES, an English author, b. in Perth in 1812; educated in London and Brussels. From the age of 22 to 32 he was engaged on the London *Morning Chronicle;* then for three years editor of the Glasgow *Argus*. He lectured in the United States in 1858; established the London *Review* in 1860; was correspondent of the London *Times* from the United States during the great rebellion. He has subsequently resided in London. Mr. Mackay's prose style is remarkably terse and clear, abounding in poetical forms of expression. He published volumes of poems in 1834 and 1840; *Memoirs of Popular Delusions*, 3 vols., 1841; the *Salamandrine*, a poem, 1842; *Legends of the Islands and Other Poems*, 1845; *The Scenery and Poetry of the English Lakes*, and *Voices from the Crowd*, 1846; *Voices from the Mountains*, 1847; *Town Lyrics* and *The Battle*, poems, 1848; and a considerable number in volumes published since. *Lost Beauties and Perishing Graces of the English Language*, 1874, is one of his latest works.

McKAY, DONALD, b. Shelburne, Nova Scotia, 1809; learned the trade of ship-builder in New York; went into the business in Newburyport, Mass.; and in 1845 established a shipyard at East Boston that became famous for the splendid improvements introduced in the models of clipper ships of great size, built for the California and Australia trade. In 1853 he produced the ship *Great Republic* of 4,500 tons burden, which, for a time, was the largest in the world.

McKEAN, a n.w. co. of Pennsylvania, on the border of New York, traversed by the Philadelphia and Erie, and Buffalo, Bradford and Pittsburg railroads; 1000 sq.m.; pop. '70, 8,825. It is a mountainous region, containing coal and iron, and heavily timbered. The inhabitants are occupied in lumbering and dairying. Co. seat, Smethport.

MACKEAN, THOMAS, LL.D., 1734–1817; b. Penn.; called to the bar in 1757, and a member of the state assembly, 1762–79. In 1765 he was a member of the committee appointed by the congress of the colonies held at New York to draw up an address to the house of commons. From 1774 to 1783 he was a member of the continental congress, and in 1781 its president. From 1777 to 1799 he was chief-justice of the Pennsylvania supreme court, resigning his place to become governor of the state, which office he retained till 1808. He was the author of the state constitution of Delaware.

McKEESPORT, a borough of Alleghany co., Penn., on the Pittsburg, Washington and Baltimore railroad, 14 m. from Pittsburg, at the junction of the Youghiogheny river with the Monongahela; pop. 2,523. It is the center of an extensive coal-mining region; has 7 churches, good schools, 2 banks, 1 newspaper, 2 foundries, and manufactories of locomotives, railroad cars, lap-welded iron tubes, window-glass, lumber, etc.

McKEEVER, ISAAC, 1793–1856; b. Penn.; entered the navy in 1809, and in 1814 was in command of an American gunboat which was captured, after a severe struggle, by a British force in barges and boats upon lake Borgne, Louisiana. The American fleet consisted of 5 gunboats with 182 men, and the English force numbered more than a thousand. McKeever afterward rose to be commander and capt. and he was in command of the Brazilian squadron, 1851–54.

MacKELLAR, THOMAS, b. N. Y., 1812; early a proof-reader for the Harpers, and subsequently foreman and proprietor of a large stereotype foundry in Philadelphia.

He is the author of 3 volumes of verse: *Droppings from the Heart; Tam's Fortnight Ramble;* and *Lines for the Gentle and Loving.*

McKEN'DREE, WILLIAM, D.D., 1757–1835; b. King William co., Va.; was adjutant and commissary in Washington's army for several years, and was present at the surrender of Cornwallis at Yorktown in 1781; in 1788 joined the itinerant Methodist ministry; accompanied Asbury in his tour of South Carolina; in 1801 was sent by the bishops to preside over the Kentucky district, and to have the general supervision of the western conference, embracing Ohio, Kentucky, Tennessee, Virginia, and part of Illinois. He traveled extensively and preached with great eloquence and power. In 1808 he was made bishop. In 1809 he visited with Asbury a large part of the west and Canada. He preached nearly 50 years, 12 years he was presiding elder, and 27 years a bishop. He was a man of vigorous mind, great modesty, and devoted piety, and was honored by every class of society.

MACKENZIE, Sir ALEXANDER, 1755–1820; b. Scotland; emigrated to Canada, and was employed by the Northwestern fur company. In 1789 he set out on an exploring expedition from lake Athabasca, and followed to its mouth the river which has since been named after him. In 1792 he started on another expedition; this time towards the Pacific, to which he came in 1793. An account of both these expeditions is to be found in his *Voyages*, etc., 1801. He was knighted in 1802.

MACKENZIE, ALEXANDER SLIDELL, 1803–48; b. New York. His family name was Slidell; he entered the U. S. navy in 1815; became lieut. in 1825, commander in 1841; served in the West Indian, Brazilian, Pacific, and Mediterranean squadrons. He changed his name to Mackenzie in 1837 in honor of a maternal uncle. Capt. Mackenzie became celebrated in 1842 by an event on board his ship that for a time produced great excitement in the United States. While in command of the brig *Somers*, which had been manned chiefly by naval apprentices from the U. S. naval academy and school-ships, on its return voyage from the coast of Africa a serious mutiny was discovered among them. Its ringleader was a son of John C. Spencer, the secretary of war. After a trial he and two others were hung from the yard arm. Young Spencer had been a dangerous character from his boyhood, but was so well connected that the action of capt. Mackenzie was severely criticised as hasty and cowardly. But a court of inquiry fully sustained his action, and revealed a skillful plot of the youths to turn the brig into a piratical craft as soon as they should achieve their object. Capt. Mackenzie was ordnance officer in the Mexican war, and participated in the storming of Tobasco in June, 1847. He possessed decided literary ability as the following works will show: *A Year in Spain*, 1829–36; *Popular Essays on Naval Subjects*, 1833; *The American in England*, 1835; *Spain Revisited*, 1836; *Life of John Paul Jones*, 1841; *Life of Oliver Hazard Perry*, 1841; and *Life of Stephen Decatur*, 1846.

MACKENZIE, CHARLES FREDERICK, D.D., 1825–62, b; Scotland; took his first degree at the university of Cambridge in 1848, and became a clergyman in the church of England; after some service as a parish minister, obtained a fellowship at Cambridge and lectured there; 1854–59 was archdeacon at Natal, South Africa, under bishop Colenso; having returned to England to promote the extension of missions in Africa, he was appointed bishop of Central Africa, and was consecrated at Cape Town, Jan. 1, 1861; went to the Zambesi river with a company of missionaries and began his work at Magomero, but soon fell a victim to the climate, so fatal to Europeans.

MACKENZIE, Sir GEORGE, an eminent Scottish lawyer and politician, son of Simon Mackenzie, brother of the earl of Seaforth, was b. at Dundee in 1636, studied Greek and philosophy at St. Andrews and Aberdeen, and civil law at Bourges, in France, then—as he himself calls it—"the Athens of Scottish lawyers." In 1661 he acted as counsel for the marquis of Argyle, then tried by a commission of parliament for high treason. About the same time he was made a justice-depute, and among his other duties we find him, in 1661, appointed to repair "once in the week at least to Musselburgh and Dalkeith, and to try and judge such persons as are there or thereabout delated of witchcraft." He was soon after knighted, entered the Scottish parliament in 1669 as member for Ross-shire, and in 1677 was named king's advocate. Up to this point his career had been marked by a decidedly patriotic spirit, and he was even one of the most popular men in the country. In the midst of his professional labors, he prosecuted literature with great assiduity. In 1663 appeared his *Religio Stoici, or a Short Discourse upon several Divine and Moral Subjects;* in 1665 his *Moral Essay upon Solitude;* and in 1667 his *Moral Gallantry.* He also composed some poetry. His style is admirable for the time in which he lived; he was among the first Scotchmen who wrote the English language purely. Mackenzie cultivated the friendship of the great English writers of his day, and his own taste appears to have been excellent. Dryden, in his *Discourse on the Origin and Progress of Satire*, alludes to him as "that noble wit of Scotland." Unhappily, in the popular mind he is better known as criminal prosecutor in the memorable days of the covenant, in which capacity he earned for himself the ugly name of the "bluidy Mackenzie;" nor, we fear, can it be disproved—in spite of his liberal antecedents—that he became a willing instrument of despotism. He has, however, written a defense of himself, entitled *A Vindication of the Government of Charles II.* In 1678 appeared his *Discourse on the Laws*

ana Customs of Scotland in Matters Criminal; in 1684 his *Institutions of the Laws of Scotland;* and shortly after, he took the leading part in founding the Advocates' library. He then retired to Oxford, and died in London, May 2, 1691.

MACKENZIE, HENRY, a British novelist; was b. in Edinburgh in 1745; received his education at the university of his native city, and practiced as an advocate there. In 1804 he was appointed comptroller of taxes for Scotland. He died Jan. 14, 1831, at the advanced age of 86. His *Man of Feeling*, 1771, *Man of the World*, 1783, and *Julia de Roubigné* won him rather a high place among the authors of his time. There is in all of these works something of the minuteness of Richardson, with a peculiar soft and sentimental tone, partly derived from Sterne, but without much evidence of high genius. In 1778 Mackenzie began to edit a periodical called the *Mirror* (modeled after the *Spectator*), which lasted for 17 months, and was followed by the *Lounger*, in 1785, which lasted for two years. His contributions to these display a greater manliness of style than his fictions, and a considerable measure of wit and humor. He had the credit of being the first to direct public attention, by an article in the *Lounger*, to the merits of the poems of Burns. He afterwards entered into the controversy concerning the poems of Ossian, the authenticity of which he denied, and also wrote political pamphlets in support of Pitt's administration.

MACKENZIE, ROBERT SHELTON, LL.D., D.C.L., b. Ireland, 1809; educated at Fermoy, where he taught school after having studied medicine at Cork. In 1829 he edited an English country paper. The next year he went to London, where he was engaged in literary and journalistic work for 22 years. He had already contributed to a number of American periodicals, and had been, since 1834, the regular London correspondent of the New York *Star*. He came to New York in 1852, and wrote for various papers there till 1857, when he became the literary editor of the Philadelphia *Press*, so continuing till 1879, when he assumed a similar position on the Philadelphia *Evening News*. H. has published among other works, *Lays of Palestine*, 1829; an edition of the *Noctes Ambrosianæ*, 1854; *Bits of Blarney*, 1855; *Life of Charles Dickens*, 1870; and *Sir Walter Scott*, 1871.

MACKENZIE, RONALD S., b. New York, 1840; graduated at West Point in 1862, and appointed second lieut. of engineers; was engineer of the 9th corps in the second battle of Bull Run, where he was wounded, and of Sumner's division at Fredericksburg; engaged at Chancellorsville in laying bridges in advance of the army; followed the confederate forces through Maryland into Pennsylvania, took part in the battle of Gettysburg, and in following Lee after his retreat; was in the battles of the Wilderness; wounded before Petersburg in June, 1864; commanded a regiment during Early's attack on Washington, and a brigade in the battles of Opequan, Fisher's Hill, and Cedar Creek, where he was again wounded; was appointed brig.gen. of volunteers, and resumed command before Petersburg in Nov., 1864; commanded a division of cavalry at Five Forks, where he rendered important service, being brevetted maj.gen. for gallantry. At the close of the war he returned to duty with his corps, with the rank of capt., and in 1867 was appointed col. of infantry; but in 1870 was again transferred to the cavalry service, and assigned to duty on the Mexican frontier.

MACKENZIE, WILLIAM LYON, 1795–1861; b. in Scotland; emigrated to Canada in 1820, and was employed first on the works of the Lachine canal. In 1824 he became editor of the *Colonial Advocate*, a journal published at Niagara in opposition to the governing party. He was elected in 1828 to the provincial parliament, but was refused his seat on the ground of disloyalty to the crown. He was re-elected four successive times, until the government refused to issue another writ of election. In 1832 he appealed to the home government in England for redress of grievances, carrying with him the petitions of the Canadian reform party. He was first mayor of Toronto in 1836. In 1837, he headed an armed force in Toronto and demanded of governor Head that a convention should be called to discuss Canadian grievances and reforms, which was not acceded to. He resolved to open the revolution by seizing arms with a view to arrest the governor and his cabinet, and to declare Canada a republic. But his force was insufficient. The government troops drove him from Montgomery hill, near the city, Dec. 7, 1837, and after some skirmishing forced him to retire to Navy Island, in the Niagara river. From this safe retreat, within the limits of the United States, he issued a proclamation for volunteers, offering lands—to the value of $100 to $300—in Canada, when the revolution should be successful. Some American sympathizers joined him, and a larger number of Irish. The Canadian government outlawed him, and the U. S. government took steps to stop his violation of American soil for war on Canada. He was arrested by gen. Scott's order and sentenced to 12 months' confinement in the Rochester jail. When again at liberty he became a contributor to the New York *Tribune*, and his vigorous pen was always interesting if not instructive. In 1849 the Canadian government published a general amnesty. Mackenzie at once returned to Canada, was elected to parliament, where he made a useful member, and on his retirement from that body, until his death, published a weekly journal entitled *Mackenzie's Message*.

MACKEN'ZIE RIVER, an important river of the Dominion of Canada, discovered and first navigated by Alexander Mackenzie—from whom it derives its name—in 1789, has its origin under the name of *Athabasca river* (q.v.), in Mt. Brown, and after a n.n.e. course of 687 m. falls into lake Athabasca. Emerging from this lake as the *Slave river*, it receives the Peace river, and after another course of 210 m. falls into Great Slave lake (q.v.). It now assumes the name of Mackenzie river, and conveys the waters of the Great Slave lake to the Arctic ocean at Mackenzie bay, after a final course of 876 m., making a total of 1773 miles. In many places it is more than a mile in width, and it is navigable for steamboats throughout the greater part of its course from Great Slave lake. There is only one obstruction, and that not a material one, occurring near fort Hope, in lat. about 66° north. Its chief affluent is the Liard, which rises on the w. side of the Rocky mountains, and after a course of 380 m., forces its way through a pass, and after flowing first e. and then n., joins the Mackenzie river after a total course of 690 miles. The mouth of the river is closed from October to June by ice. See ATHABASCA and GREAT SLAVE LAKE and RIVER.

MACK'EREL, *Scomber*, a genus of fishes of the family *scomberidæ* (q.v.); having a spindle-shaped body; the tail becoming very slender, and slightly ridged or keeled on each side. Some of the species have, and some have not, air-bladders.—One species, the COMMON MACKEREL (*S. scomber*), is plentiful on the coasts of Britain, and of Europe, from the Mediterranean to the furthest n., also on those of Greenland, and on the American side of the North Atlantic ocean. It is a very beautiful fish, of brilliant green and blue, the males having nearly straight dark transverse bands, the females having the bands elegantly undulated. The tail is crescent-shaped. The mackerel is said sometimes to attain a length of 20 in., but is usually about 14 to 16 in. long, and about 2 lbs. in weight. It is highly esteemed for the table, and the mackerel fisheries of the s. of England and of the southern parts of Europe are very important. Mackerel is readily caught by bait, and particularly by any kind of bait moving swiftly through the water—a long slice cut from one of its own kind, or even a slip of red leather, or a piece of scarlet cloth. Boats engaged in mackerel fishing are therefore often under sail, and a smart or "mackerel" breeze is preferred. But the greatest quantities of mackerel are taken by nets; seine-nets wrought by two boats, and inclosing shoals of fish, or drift-nets—20 ft. deep by 120 ft. long—well corked at the top, and without lead at the bottom. Mackerel, after being taken, must be sent very quickly to market, as they very soon cease to be quite fresh. Fast-sailing boats are employed for this purpose, which purchase from the fishing-boats, and often employ the aid of steam. In France and some other parts of Europe, mackerel are often salted.—It was formerly supposed that great migrations of mackerel took place; but it is now believed, as in regard to herring, that they merely leave the deep water and approach the coast for the purpose of spawning. The time when they appear varies in different latitudes: in the s. of England, the mackerel season is in the end of spring and beginning of summer; in Orkney, it is in the end of summer. —Another species, the SPANISH MACKEREL (*S. colias*), which attains the weight of 4 or 5 lbs., and is more obscurely banded, is sometimes caught on the southern coasts of Britain, but is little esteemed. It has an air-bladder, which the common mackerel has not.—The Scad (q.v.) is sometimes called HORSE-MACKEREL.—The MACKEREL-MIDGE, a very small fish, is a species of rockling (q.v.), of the family *gadidæ*.

MACKEY, ALBERT GALLATIN, 1807; b. Charleston, S. C., where he was educated for the practice of medicine, but relinquished it for literature, especially pertaining to freemasonry. In 1850 he established a masonic monthly magazine in Charleston, and in 1858 a quarterly in the same interest. His works devoted to this order are: *Lexicon of Freemasonry; The Mystic Tie; Principles of Masonic Law; The Book of the Chapter; Text-book of Masonic Jurisprudence; Cryptic Masonry and Masonic Ritualist; The Symbols of Freemasonry and Manual of the Lodge;* and *Book of Constitutions of the Grand Lodge of Ancient Freemasons of South Carolina.* An enlarged edition of the Lexicon appeared in 1875 under the title of the *Encyclopædia of Freemasonry.*

MACK'IE, JOHN MILTON, 1813; b. Wareham, Mass.; a graduate of Brown university, and author of *Life of Godfrey William von Liebnitz; Life of Samuel Gorton; Cosas de España; Life of Schamyl, the Circassian Chief; Life of Tai-Ping-Wang, Chief of the Chinese Insurrection; From Cape Cod to Dixie;* and numerous contributions to the *North American Review.*

MCKIM, JAMES MILLER, 1810–74; b. Carlisle, Penn.; graduated at Dickinson college, and entered the ministry of the Presbyterian church. Soon after the organization of the American antislavery movement, he left the pulpit to devote himself to the cause of emancipation, which he served with marked ability and soundness of judgment until near the close of the war of the rebellion. As lecturer, organizer, corresponding secretary of the Pennsylvania antislavery society, and editor at times of the *Pennsylvania Freeman*, his labors were of great value. Near the close of the war of the rebellion, when the emancipation of the slaves had been proclaimed by president Lincoln, he resigned his office in the antislavery society to devote himself to the work of the Freedmen's aid commission. His earnest devotion, united with his soundness of judgment, clear moral insight, and wide experience, qualified him for eminent service in the work

of the new society. He was one of the founders of *The Nation* newspaper. Died in Llewellyn Park, Orange, N. J.

MACKINAW, a co. in Michigan, on the s. part of the n. peninsula; 1100 sq.m.; pop. '80, 2,902. It comprehends a number of islands, besides the mainland, the entire region being rough and uncultivated, and heavily wooded. The principal industry is lumbering. Co. seat, Mackinaw.

MACK'INAW, or MICHILIMACK'INAC, a village on an island of the same name, in the n.w. part of lake Huron, belonging to Michigan, 320 m. w.n.w. of Detroit, is an old French trading post, now a fashionable summer resort. Fort Mackinaw, on a bluff 150 ft. high, commands the village and harbor. It has extensive fisheries, and is a stopping-place for steamers plying between the lower and upper lakes. Pop. about 1000.

MACKINAW (*ante*), capital of Mackinaw co., Michigan; present pop. about 1500. The island is 3 m. in its longest diameter, and is n.e. of the strait of the same name. Many of the inhabitants are of French descent, as the place was early occupied by the French, and a missionary station established in 1699. The inhabitants were massacred by the Indians under Pontiac, the Ottawa chief, at the time of his attack on Detroit, 1763. The harbor is deep and safe, though small. The fish industry is very large and the village is a pleasant resort for summer tourists.

McKINSTRY, JAMES P., 1809–73; b. N. Y.; entered the navy in 1826, was made lieut. in 1837, commander in 1855, and capt. in 1862. He was in command of the the Monongahela at Port Hudson in 1863, and received severe injuries. He was appointed a commodore in 1866.

MACKINTOSH, Sir JAMES, a philosopher and politician, was the son of capt. John Mackintosh of Kellachie, in Inverness-shire, and was b. at Aldourie in that county, Oct. 24, 1765. He studied at King's college, Aberdeen, where his most intimate companion was Robert Hall, afterwards the celebrated Baptist preacher. From King's college he proceeded to Edinburgh in 1784, for the purpose of studying medicine; and after obtaining his diploma, settled in London, and for some time supported himself by writing for the newspapers. The first work that brought him into notice was his *Vindiciæ Gallicæ*, (1791), in reply to Burke's *Reflections on the French Revolution*. In sober philosophic thought, sound feeling, and common sense it greatly surpassed the splendid philippic against which it was directed, and was enthusiastically lauded by the liberal party; Burke himself thought highly of it. Fox, Sheridan, and other leading whigs sought the author's acquaintance; and when the "association of the friends of the people" was formed he was appointed secretary. About this time, he began to turn his attention to the legal profession, and was called to the bar in 1795, and attained high eminence as a forensic lawyer. In 1799 he delivered a course of lectures on the law of nature and of nations, before the benchers of Lincoln's inn, which were attended by audiences of the most brilliant description. His defense of Peltier (Feb. 21, 1803), charged with a libel on Bonaparte, was superb. It was translated into French by Mme. de Staël, and scattered broadcast over Europe. In 1804 he was appointed recorder of Bombay, for which place he sailed in the beginning of the year, arrived there in May, was appointed judge of the admiralty court in 1806, and remained till 1811. His Indian career was highly creditable to his capacity and honorable to his character. After his return to England he entered parliament as whig member for Nairn (1813), accepted the professorship of law in the college of Haileybury in 1818, and in 1830 became a member of the board of control under the Grey ministry, and spoke in favor of the reform bill. This was his last great political effort. He died not long after, on May 22, 1832. Every one *now* will regret that sir James Mackintosh ever turned aside to a political life. He was essentially a literary moralist and philosopher, and might have won a far higher and more enduring reputation than he has if he had resolutely prosecuted the calling for which nature intended him. His *Dissertation on the Progress of Ethical Philosophy*, written for the *Encyclopædia Britannica*, although very incomplete, and lacking that precision and profundity that can only be acquired by rigorous and extensive research, shows the admirable powers of the author, his breadth of view, tolerance, impartiality, love of truth and virtue, and his gift of calm and measured eloquence. For Lardner's *Cyclopædia* he wrote a brief but excellent survey of the history of England. An historical fragment (intended to form portion of a large work) entitled *History of the Revolution in England in* 1688, appeared after his death, and was pronounced by Macaulay to be the best history of the reign of James II. A collection of his miscellaneous works, including his contributions to the *Edinburgh Review*, was published at London, in 3 vols. See *Memoirs* of his life by his son, 2 vols. (Lond. 1835).

MACKLIN, CHARLES, 1690–1797; b. Ireland; changed his name from McLaughlin to the one under which he is generally known. After a rather reckless and wandering youth, during which period he was for a time identified with a dramatic company in the capacity of harlequin, he appeared at the Lincoln's Inn theater, London, in a small part, and from that time seems to have continued in the theatrical profession. In 1735 he was embroiled with a brother actor, and becoming the accidental cause of his death, was tried for manslaughter and convicted. Six years later, however, he was at Drury

Lane theater, where he made a successful appearance in the character of Shylock, occasioning Alexander Pope to write concerning his performance,

> This is the Jew
> That Shakespeare drew.

In 1753 he left the stage, and kept a tavern, varying this occupation by lecturing on oratory in Covent garden, in which vocation he was not successful. He returned to the stage in 1758, and continued to act until he had reached his century, when his strength failed him, and he made his final retirement. His powers of facial expression were so comprehensive, and his features so marked that Quin said of him, "If God writes a legible hand, that fellow's a villain." He wrote 10 plays, of which but two have remained to us, *Love à la Mode*, and *The Man of the World:* the latter of these pieces was revived, and produced at Wallack's theater, New York, a few years since.

MACKNIGHT, Dr. JAMES, an eminent divine of the church of Scotland, was b. at Irvine, in Ayrshire, Sept. 17, 1721; studied at Glasgow university, and afterwards at Leyden, in Holland; and in 1753 was ordained minister of the parish of Maybole. In 1769 he was translated to Jedburgh, and thence to Edinburgh in 1772, where he died, Jan. 13, 1800. Macknight was a superior scholar, a liberal, wise, and prudent ecclesiastic, and one of the most respectable writers that the church of Scotland has produced. His principal works are: *Harmony of the Four Gospels* (1756); *The Truth of the Gospel History* (1763); and *A New Translation of the Apostolical Epistles, with Commentary and Notes* (1795).

MACK VON LEIBERICH, KARL, Baron de, 1752–1828; an Austrian noted for his skill in the seven years' war against the Turks. He directed the allied armies against the forces of the first French republic and was noted for the excellence of his plans more than for their successful execution. He was utterly beaten in Italy by the French in 1798 and made prisoner; escaped and was in command of Austrian armies in Tyrol, Dalmatia, and Italy in 1804. In Oct., 1805, while in command of troops in Ulm he was compelled to surrender his entire force to the French under Napoleon. An Austrian court-martial condemned him to death; the government commuted the sentence to imprisonment for life, and in 1819 pardoned him out. He died near Vienna.

McLANE, ALLEN, 1746–1829; entered the American army as a volunteer in 1775, and served through the revolutionary war. He was a lieut. under Cæsar Rodney of Delaware, where he had settled just before the revolution. He distinguished himself at Long Island and White Plains, participated in the campaign in New Jersey, and was promoted to a captaincy in 1777. He next commanded the American outposts about Philadelphia, and was present at the battle of Monmouth, June 28, 1778. The next year he was a maj. in gen. Henry Lee's "legion," assisted in surprising the garrison of Paulus Hook, and was with Wayne at the capture of Stony Point, the same month. He was with the American army before Yorktown, till Cornwallis surrendered; but the close of the war found him comparatively poor, as he had sacrificed to the cause of the colonies a valuable estate near Philadelphia. After the close of the war he held a number of important civil offices; he was chosen a member, and afterwards speaker, of the Delaware legislature; a justice of the court of common pleas, and from 1808 till his death, collector of Wilmington.

McLANE, LOUIS, 1786–1857; b. Del.; at first entered the navy, but was afterwards called to the bar. He was a member of congress 1817–27, and was then chosen senator. From 1829 to 1831 he was minister to England, and on his return took a place in Jackson's cabinet as secretary of the treasury; but in 1833, having refused to give his consent to the removal of the government deposits from the U. S. bank, he was transferred by Jackson to the department of state. He retired from public life in 1834, and was made president of the Baltimore and Ohio railroad in 1837. In 1845 he was sent to London to take charge of the Oregon negotiations, and resigned on their conclusion.

McLANE, ROBERT MILLIGAN, b. Del., 1815; educated at Washington college and St. Mary's college, and at West Point. He was in the army from 1837 to 1843, when he resigned and was admitted to the bar. He was a member of the Maryland legislature 1845-47, and in the latter year was elected to congress, where he served two terms. President Pierce appointed him minister to China in 1853, and he remained there two years. He was U.S. minister to Mexico from Mar., 1859, to Nov., 1860, and has since practiced law in Baltimore.

MACLAURIN, COLIN, an eminent mathematician, was b. in 1698 in Kilmodan, in Argyleshire, Scotland. He was educated at Glasgow university, where he took the degree of M.A. in 1713; and after four years of close study obtained, in 1717, after a severe competitive trial, the professorship of mathematics in Marischal college, Aberdeen. In 1719 he visited London, and was received as member of the royal society, at the same time making the acquaintance of many eminent men, Newton among the rest. Here he published his *Geometria Organica* (1720), an elaborate treatise on the "description" of curves. He afterwards visited France in the capacity of tutor to a son of lord Polwarth, and while there wrote a dissertation *on the impact of bodies*, which gained the prize of the academy of sciences in 1724. The following year he was appointed assist-

ant to James Gregory, professor of mathematics in the university of Edinburgh, and soon after succeeded him in the chair. He died in 1746. His writings, distinguished for their originality, profundity, clearness, and elegance of style, gave a strong impetus to the study of mathematical science in Scotland. His works, besides those above-mentioned, are: *A Treatise of Fluxions* (Edinburgh, 1742), a work written in defense of Newton's discoveries against the attack of Berkeley, and the first in which the principles of fluxions were logically arranged; *A Treatise on Algebra* (1748), left incomplete by the author; *An Account of Sir Isaac Newton's Philosophical Discoveries* (Lond. 1748), also incomplete and posthumous, which contains explanations of all Newton's discoveries, the optical ones excepted; and a number of papers which were published in the Edinburgh *Philosophical Transactions*. His most important scientific investigations related to the "form of the earth," the "tides," and the action of the wind on the sails of ships and wind-mills. His memoir on the tides was, in 1740, presented in competition for the prize offered by the academy of sciences; but three other competitors, Euler, Daniel Bernouilli, and father Cavalleri, having appeared, the academy divided the prize among them.

MACLAY', ARCHIBALD, D.D., 1778–1860; b. at Killearn, Scotland; became a minister of the national kirk in 1802. He came to New York in 1805, and was pastor of a Presbyterian church in Rose street, but in 1808 he became a Baptist and founded a church in Mulberry street (since removed to Second avenue and called the Tabernacle), of which he was the pastor until 1837, when he became the agent of the American and foreign Bible society, which he served until 1850, and then became president of the American Bible union.

MACLE, a term employed in mineralogy to designate what are also called *twin crystals*, which are crystals united according to some precise law, yet not having their faces and axes parallel, so as to render the one a mere continuation of the other. In some macles the axes are parallel; in some they are inclined at an angle. Crystallization in macles is very characteristic of some minerals.

MACLE is the name of a mineral, also called CHIASTOLITE, a silicate of alumina, containing a little magnesia and oxide of iron. Macle has been much used for making beads for rosaries, etc.

McLEAN, a co. in central Illinois, watered by affluents of the Illinois river; intersected by the Illinois Central, Toledo, Peoria and Warsaw, Chicago and Alton, and Indianapolis, Bloomington and Western railroads; 1132 sq.m.; pop. '80, 60,115. The surface is generally prairie land, and the soil fertile; the productions are Indian corn, wheat, rye, oats, barley, potatoes, wool, hay, and butter. There are a large number of manufactories, including carriages, agricultural implements, cars, machinery, iron castings, saddlery and harness, etc. Co. seat, Bloomington.

McLEAN, a co. in n.w. Kentucky, watered by the Green river, and intersected by the Owensboro and Nashville railroad; 320 sq.m.; pop. '80, 9,293. It has a varied surface and fertile soil, and produces freely tobacco, wheat, Indian corn, wool, and butter. This county is heavily timbered. Co. seat, Calhoun.

MACLEAN, JOHN, D.D., b. at Portsey, Banffshire, Scotland, in 1828; studied at the university of Aberdeen; appointed curate at London, Ontario, in 1853; archdeacon of Manitoba, and professor of divinity in St. John's college in 1866, and bishop of the diocese of Saskatchewan in 1873.

MACLEAN, JOHN, LL.D., 1785–1861; b. N. J.; settled in Virginia in 1799. He at first worked on a farm, but in 1803 began to study law in Cincinnati, and was called to the bar. He was a member of Congress from 1813 to 1816, and then was made an associate justice of the Ohio supreme court, which office he retained until 1822, when he accepted from president Monroe the place of land commissioner; and the next year he became postmaster-general. He brought the post-office department to a high degree of efficiency for those times, and in recognition of his services congress raised his annual salary from $4,000 to $6,000. In 1829 Jackson, who had previously offered him a place in his cabinet, appointed him an associate justice of the U. S. supreme court. His most famous judicial opinion was delivered in the Dred Scott case, when, dissenting from the chief-justice (Taney) and a majority of the court, he held that slavery exists by force and not as of right, and that its regulation is a matter of local law. From his well-known opposition to the extension of slavery, he was a candidate for the presidential nomination of the free-soil party in the convention at Buffalo in 1848, and for the Republican nomination in 1856 and 1860. His only publications, besides his occasional addresses, are a number of volumes of law reports.

MACLEAN, LETITIA ELIZABETH (LANDON). See LANDON, LETITIA ELIZABETH, *ante*.

McLENNAN, a co. in central Texas, watered by the Brazos river; intersected by the Houston and Texas Central railroad; 960 sq.m.; pop. '80, 26,933. It has an undulating surface, comprising rich bottom lands and rolling prairies, the soil being remarkably fertile. The productions are Indian corn, wheat, oats, sweet potatoes, and cotton. Co. seat, Waco.

McLEOD, a co. in s. central Minnesota, drained by the s. fork of the Crow river, and intersected by the Hastings and Dakotah railroad; 504 sq.m.; pop. '80, 12,343. It has an undulating surface and fertile soil; productions: Indian corn, oats, wheat, barley, potatoes, wool, butter, and hay. Small lakes, prairies, and timber land afford diversity to the character of the surface; valuable timber abounds, including oak, elm, and ash. Co. seat, Glencoe.

McLEOD, ALEXANDER, D.D., 1774–1833; b. in the island of Mull, Scotland; emigrated to the United States in 1792; graduated at Union college in 1798; was ordained and installed pastor of the First Reformed Presbyterian church in New York in 1801, where he remained until his death. He was assistant editor with Dr. John Mason of the *Christian Magazine*. His chief works are: *Negro Slavery Unjustifiable; Ecclesiastical Catechism; Lectures upon the Principal Prophecies of the Book of Revelation; View of the Late War; The Life and Power of True Godliness*; *The American Christian Expositor; Messiah Governing the Nations*. He was prominent in the organization of the American colonization society in 1816, and wrote its constitution.

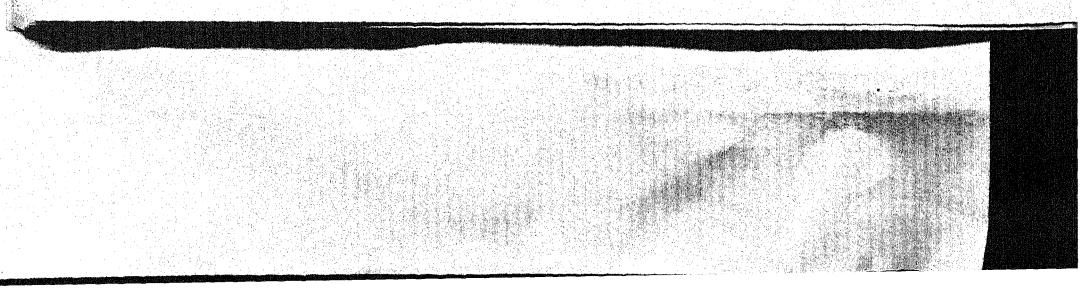
MACLEOD, HENRY DUNNING, b. Scotland, 1821; educated at Eton and Cambridge, and admitted to the English bar in 1849. He attained considerable distinction as an authority on economic and financial subjects, to which a number of his books are devoted, as: *Theory and Practice of Political Economy; Elements of Political Economy;* and *A Dictionary of Political Economy*. He has also been active as a law reformer and codifier; many of the changes and improvements in the poor laws of Scotland were originated by him; and between the years 1868 and 1870 he was employed, at the request of the British government, in digesting and codifying the law of bills of exchange.

MACLEOD, NORMAN, D.D., a divine of the church of Scotland, eminent for his pulpit oratory, his writings, and his liberal Christianity, was b. at Campbeltown, in Argyleshire, in 1812. He was educated at the university of Glasgow, and entering the church, became successively minister of Loudon in Ayrshire, Dalkeith, near Edinburgh, and the important barony church, Glasgow. He gained the degree of D.D. in 1858, was appointed one of the queen's chaplains in Scotland, and in 1869 was moderator of the general assembly of the church. In 1850 he visited Canada, and in 1867, India, on missions connected with the business of the church of Scotland. From 1850 to 1860 he edited the *Edinburgh Christian Magazine*, and from 1860 onwards was the conductor of *Good Words*, to which he contributed numerous tales, essays, verses, etc., many being republished. Among the most important and popular of his works are: *Reminiscences of a Highland Parish; The Old Lieutenant and his Son; Eastward; The Gold Thread; The Starling; The Earnest Student; The Home Education; Sermons*, etc. Dr. Macleod died at Glasgow June 16, 1872. See *Memoir*, by his brother, the rev. Donald Macleod (1876).

McLEOD, XAVIER DONALD, 1821–65; b. New York; son of Alexander; graduated at Columbia college, and admitted to orders in the Protestant Episcopal church in 1845. After preaching for a short time in a country parish, he traveled and studied in Europe. While abroad he became a Roman Catholic, and on his return engaged in literary pursuits. His publications are: *Pynnshurst: his Wanderings and Ways of Thinking; Life of Sir Walter Scott; The Bloodstone; Life of Mary, Queen of Scots; The Elder's House, or the Three Converts; Château Lescure, or the Last Marquis; The Weeder* and *The Saga of Viking Torquil*, two poems which have much merit. In 1857 he became professor of belles-lettres at Mount St. Mary's college, near Cincinnati, and was ordained as a priest.

MACLISE, DANIEL, R.A., an eminent painter of Scotch extraction, was b. at Cork, Ireland, Jan. 25, 1811; entered the royal academy, London, in 1828, and acquired a high reputation as a student. In 1833 he exhibited his first picture at the British institution, "Mokanna unveiling his Features to Zelica;" and in the same year, "All-Hallow Eve," and "A Love Adventure of Francis I. with Diana of Poictiers," at the royal academy. Since then, among his principal works may be mentioned: "Robin Hood and Richard Cœur-de-Lion," and "Merry Christmas in the Baron's Hall" (1838); "The Banquet Scene in Macbeth," and "Scene from Twelfth Night" (1840); "Play Scene in Hamlet" (1842); "Ordeal by Touch" (1846); and his design of "Shakespeare's Seven Ages" (1848); "The Gross of Green Spectacles" (1850); "Caxton's Printing-office" (1851). The frescos—each 45 ft. long and 12 ft. high—in the royal gallery of the house of lords, depicting "The Meeting of Wellington and Blücher on the Evening of the Battle of Waterloo," and "The Death of Nelson at Trafalgar," are admitted to be the finest mural paintings hitherto executed in Britain. The only pictures worthy of note exhibited by Maclise after the completion of these great works were: "Othello," "Desdemona," and "Ophelia" (1867); "The Sleep of Duncan," and "Madeline after Prayer" (1868); "King Cophetua and the Beggar Maid" (1869); "The Earls of Desmond and Ormond," posthumously exhibited in 1870, the year in which he died.

MACLURE, Sir ROBERT JOHN LE MESURIER, the discoverer of the north-west passage, was b. at Wexford in Jan., 1807, and was sent for his education first to Eton, and afterwards to Sandhurst. Intended for the military profession, but having no great love for it, he secretly left Sandhurst, and through the good offices of a friend, was entered as a midshipman on board the *Victory*. He volunteered for the Arctic expedition in H.M.S.



Terror, capt. Back, in 1836, returning to England in 1837. In Nov., 1837, he received his commission as a lieut.; and on June 18, 1842, was appointed to the command of the *Romney* receiving-ship at the Havana, where he remained until the early part of 1846. In 1848 he joined sir James Ross's expedition in search of Franklin; and upon its return in 1849 he was promoted to the rank of commander. This expedition had barely returned to England when it was resolved by the admiralty to dispatch the vessels composing it—viz., the *Enterprise* and the *Investigator*—on a fresh search for the Franklin party by way of Behring's strait. Accordingly, capt. Richard Collinson, C.B., was appointed as senior officer to the *Enterprise*, and commander Maclure to the *Investigator*. On Jan. 20, 1850, the vessels set sail, with instructions to make the best of their way to cape Virgins, in order to arrive at Behring's strait in July. The *Investigator* could not keep up with the *Enterprise*, which was towed through the strait of Magellan by a steamer some time before the *Investigator* got there. After rounding cape Horn, the *Investigator* met with her consort lying at anchor in Fortescue bay; but soon again they separated, and met no more during the voyage. Capt. Maclure now proceeded alone, in the *Investigator*, towards the ice-regions. On Aug. 2, after passing through Behring's strait, he spied, in lat. 72° n., ice right ahead. On the 8th his men first met with Esquimaux, close to point Pitt, where a party was sent ashore to erect a cairn, and place a notice of the *Investigator* having passed. These Esquimaux encouraged them in the belief that, as they proceeded eastward, they would find an open channel. As they proceeded, however, along the coast of America, the ice became troublesome and even threatening. There were also numerous shoals, which made the navigation intricate and dangerous. On Aug. 31 the *Investigator* reached cape Bathurst, from which she continued to advance for several days in a north-easterly direction. On Sept. 11 unmistakable signs of winter presented themselves. On the 17th the *Investigator* reached her most advanced position in lat. 73° 10′ n., and long. 117° 10′ w., about 30 m. from the waters of that series of straits called Melville, Barrow, and Lancaster, communicating with Baffin's bay. The ice now almost hemmed the vessel in on every side; and capt. Maclure determined to winter in his present position. The *Investigator* became finally fixed in the ice in lat. 72° 50′ n., and long. 117° 55′ west. On Oct. 22, capt. Maclure determined to reach the sea, if possible, by a sledge-journey. He accordingly set out with a party of men and officers; and, after sustaining much fatigue and privation, was at last rewarded on the 26th by a sight of the north-west passage. "The position of mount Observation, from which the important discovery had been made, was ascertained to be in lat. (observed) 73° 30′ 39″ n., long. 114° 39′ w., and by lunar 114° 14′ west." After this discovery the party returned to the *Investigator;* but that vessel was not destined herself to sail homewards through the passage discovered by her commander. All that winter and spring she remained frozen up in the ice. In July she began to move again, but the nearest she could get to the passage was 73° 43′ 43″ n. lat., and long. 115° 32′ 30″, 25 m. from the waters of Barrow strait. This was on Aug. 15, 1851. On the following day commander Maclure resolved to abandon this course, go round the s. end of Banks's land, and endeavor, by passing to the westward of it, to reach Melville island by that route. For 300 m. and more, the *Investigator* sailed in this direction without being once checked by ice. On Aug. 19, however, a sudden change came; the ice pressed against both sides of the vessel, and immense masses threatened to topple over and sink her with their weight. By Sept. 1 the *Investigator* became completely ice-bound about 50 yards from the shore. On the 10th, however, there was another change; the ice broke from the coast, carrying the *Investigator* with it, and she slowly sailed along for several days, until eventually she settled in a bay, where commander Maclure resolved to winter. To this bay he gave the name of bay of Mercy, in gratitude for the escape of the ship and crew from numerous dangers, as also because the neighboring land abounded in reindeer, hares, and other animals, which gave them good supply of food. In this bay they passed their second Christmas, and the time wore on until April, 1852, when commander Maclure visited Melville island with a sledge-party, in the hope of finding some of capt. Austin's ships, or at least a depot of provisions, but was disappointed. He returned to the vessel, where all was still well; but in May the scurvy broke out among his crew, and increased during the summer. Aug. came and still there was no open channel, and in the following month it became clear that they must pass a third winter in the ice. It now became necessary to decide what they should do for the future, as provisions were failing; and, accordingly, commander Maclure announced to his men that, in the following April, he would send away 30 of the crew to make their way homewards in two parties—one by way of North America up the Mackenzie river; the other by way of cape Spencer, Beechey island; while he himself, with the remainder of the officers and crew, would stay by the ship, spend a fourth winter, and then, if not relieved, endeavor to retreat upon Lancaster sound. The men cheerfully acquiesced; and when April came the sledges were got ready for the retreating parties. On the 6th of that month commander Maclure and his first lieut. were walking near the ship conversing, when they perceived a figure rapidly approaching them from the rough ice at the entrance of the bay. When within a hundred yards of them he shouted and gesticulated, but without enabling them to guess who it could be. At length he came up to them, and, to their joy and astonishment, announced himself thus: "I am lieut. Pim, late of the *Herald*, and now in the *Resolute*. Capt. Kellett is in

her at Dealy island." Pim had come from Melville island, in consequence of one of capt. Kellett's parties having discovered an inscription left by commander Maclure on Parry's famous sandstone rock in Winter harbor. Commander Maclure now resolved, although reluctantly, to abandon his ship altogether and return with capt. Kellett to England. He reached England Sept. 28, 1854. His first reward was to receive his commission of post-capt., dated back to the day of his discovery of the north-west passage. Shortly afterwards he received from her majesty the honor of knighthood. A reward of £10,000 was also granted to the officers and crew of the *Investigator*, as a token of national approbation of the men who had discovered *a* north-west passage from the Pacific to the Atlantic ocean. In Mar., 1856, sir Robert Maclure was appointed to the command of H.M. steam-corvette *Esk*, serving in the East Indies and China, but which returned to England in 1861. He died Oct. 17, 1873.

MACLURE', WILLIAM, 1763–1840; b. Scotland; came to this country in 1782, but returned to London, and engaged in mercantile business, from which he retired with a fortune. He made the United States his home after 1796, and went abroad in 1803 as a U. S. commissioner to settle the French spoliation claims. During this visit to the continent he pursued a course of geological study, making large collections of specimens. He had already determined to make a general geological survey of the United States, and on his return traveled extensively in furtherance of that object. The first account of his researches is found in his *Observations on the Geology of the United States*, which he read before the American philosophical society in 1809. He published a second paper in 1817, with a geological map of the United States. About this date he settled in Philadelphia, and was elected president of its academy of natural sciences, an office which he retained till his death. In the *Journal*, which he had founded as the organ of the academy, he published a description of the geology of the Antilles, which he visited in 1816. Three years later he went to Spain, where he bought a large tract of land from the government, then in the hands of the revolutionists, and endeavored to found a sort of agricultural school; but on the downfall of the provisional government the title to his land failed, and the experiment was abandoned. He afterwards entered upon a scheme of the same kind at New Harmony, Ind., which also was unsuccessful. In 1827 and again in 1828, he went to Mexico, and there he died. His library and most of his collection of maps and charts, with the sum of $20,000 to erect a building for their reception, were bequeathed to the Philadelphia academy of natural sciences; and many of his specimens were given to the American geological society of New Haven, Conn.

MACMAHON, MARIE EDME PATRICE MAURICE DE, Marshal of France, of Irish descent, was b. at Sully, July 13, 1808. Entering the army, he led a distinguished career in Algeria, and commanded the division that stormed the Malakoff at Sebastopol in 1855. He took a conspicuous part in the Italian campaign of 1859, received a marshal's baton, and was created duke of Magenta in commemoration of the battle of that name. He was nominated governor-general of Algeria in 1864. In the Franco-German war of 1870–71, he had command of the first army corps, was defeated at Wörth, and captured, wounded, at Sedan. In 1871, after the close of the war, he was made commander-in-chief of the French army, and in 1873 he was elected president of the republic, his powers being confirmed to him for a period of seven years. His sympathies were conservative, and at times seemed to be reactionary; suspicions of a *coup d'état* were more than once excited, especially in 1877. His refusal to sanction the dismissal of several generals known to be hostile to the now firmly established republican *régime*, led to his resignation in Jan., 1879.

MACMAHON, MARIE EDME PATRICE MAURICE DE, Duke of MAGENTA, Marshal of France (*ante*), and President of the republic of France; b. Sully, *Saone-et-Loire*, June 12, 1808; son of a *maréchal de camp* under Louis XVIII. in 1814, who was made a peer in 1827. He was of an Irish family, who took refuge in Burgogne on the fall of the Stuarts. He graduated at the college of St. Cyr in 1825, and entered the army; was in the campaign of Algiers in 1830; at the siege of Antwerp in 1831; returned to Africa, and acted as aid-de-camp to several generals; was wounded severely in 1837; resumed active service in 1840; and, in consequence of brilliant and arduous service in Algeria, was rapidly advanced from that time till 1849, when he had become a gen. of division and commander of the legion of honor. In 1855 Napoleon III. recalled him from Africa, and gave him a command in the n. of France. In August he was sent to the Crimea to command a division under Bosquet. He arrived at Sebastopol on the eve of an assault, and had the command of the most exposed and aggressive division of the army, which stormed the great citadel, Sept. 22, 1855. On returning to France he was made senator. In a body distinguished principally for its servility to Napoleon, MacMahon was remarked for the good sense and sturdy independence of his votes. In 1857 he was placed in command of a part of the army of Algeria, and in 1858 made supreme in command. In 1859, on the breaking out of the war with Austria, MacMahon was put in command of the 2d corps. June 2 his forces pushed back the advance of the Austrians, and two days afterwards he was the chief director of the battle of Magenta, in which he turned into a victory a defeat impending through Napoleon's inefficiency. At the battle of Solferino, a few days later, he again signalized his generalship by victory. In Nov., 1861, he was sent to Berlin to represent France at the

crowning of William III., king of Prussia. In Oct., 1862, he was commander of the 3d army corps at Nancy; and in Sept., 1864, was named governor-gen. of Algeria. In 1869 the plan of regal military government for Algeria was abandoned, and gen. MacMahon tendered his resignation. The war with Germany soon afterward opened. He was placed at the head of the 1st army corps, July, 1870. With 32,000 men and headquarters at Strasbourg, he seems to have separated his command strangely from the main army, and in the battles of Wissenberg and Reichshoffen suffered a crushing defeat by the Prussians. He conducted the retreat of 18,000 of his demoralized army to Châlons. There, placed at the head of a newly organized force of 120,000, he was ordered, Aug. 23, to march to the relief of Bazaine. Thiers had remonstrated against the order, and MacMahon's advice had not been asked. The army marched into the gulf of Germans prepared for it, without power either to help or to be helped by Bazaine. On Sept. 1 the German environment was complete, and resulted in another crushing defeat of the French and a severe wound to MacMahon.

After the treaty of peace in Mar., 1871, Thiers called him to the command of the army of Versailles, to recover Paris from the commune. After an energetic siege MacMahon entered the city May 21, and on the 28th, after seven days of sanguinary fighting with the desperate forces of the commune and their conflagrations, he was master of the city. In September, in submitting to an examination concerning the cause of the disasters of the French army in the beginning of the war with the Germans, he generously took upon himself the blame of the first defeats. When Thiers announced that he favored the establishment of a conservative republic, MacMahon was urged to assume dictatorial powers. He refused, and gave his hearty support to the Thiers government. But the clerical and royalist parties combined to place Thiers in such a minority that, after his definitive resignation in May, 1873, as chief executive, they united to elect MacMahon provisional president of France. The object was to insure the peace of France, while each royalist faction was preparing to bring in its king. MacMahon accepted the functions of president of the republic, with the remark that the vote "brought no modification of the laws or of existing institutions." His message to the assembly breathed a simple desire to conform his acts to its will as their sentinel, servant, and executor. His military habits and predilections made his administration seem to tend to monarchical reaction. But the subsequent years proved that, whatever may have been his private predilections, he intended to conform conscientiously to his inaugural promise to obey and to enforce the laws. Nov. 19, 1873, his term of office was extended to 1880. His powers were almost imperial. He alone, during his term, had the right to propose a revision of the laws. Jan. 13, 1876, he addressed a letter to the French people on the eve of the first general election under the constitution of 1875. In this address he announced his policy as "conservative and liberal"—a policy of repose for France, whose "institutions ought not to be revised before they are honestly tried;" all whose parties, therefore, were urged to rally around his government. This frank appeal was met by an unexpected return of a largely increased number of republicans to the assembly. There was a growing fear in France that the personal government of MacMahon, however honest he might be, was too like the imperial *régime*, and tended to some new form of despotism. The pronounced republicans had a clear majority over their combined opponents. MacMahon, in deference to public opinion, changed his cabinet in part to represent the views of the republican majority, and the new assembly, at its convention, gave a hearty support to the executive, and emphasized the desire of France to preserve order at home and peace abroad. On the second session of the assembly, Dec., 1876, the government found itself in a minority, and some friction took place between the president's desires and those of the majority, which resulted in a compromise, by which Jules Simon, a sterling republican, was made vice-president of the council of ministers, and Martel minister of justice and religion. The president had opposed and secured the defeat of a motion of Victor Hugo for the pardon of the banished communists; but during the year following he pardoned a large number of them by virtue of his powers under the constitution. In April, 1877, the bishop of Nevers wrote to the president, calling upon him to draw the sword against Italy for "the prisoner of the Vatican," to which he sent an answer that the bishop had exceeded the functions of his office. May 16 a crisis in the government was precipitated by a letter from the president to his chief minister, Jules Simon, suggesting that his policy was not satisfactory. The latter immediately tendered his resignation, which was at once accepted. This action was supposed to mark a determination to break with the republicans, and to support one of the parties of the right. At the opening of the chamber the following day, Gambetta made a motion: "that the confidence of the majority can be accorded only to a cabinent free in its action, and resolved to govern according to republican principles, which alone can guarantee order and prosperity at home and peace abroad." This was adopted by a vote of 355 to 154. A new cabinet was announced May 18, and the president addressed a message to the chambers in explanation of his policy, in which he called attention to his scrupulous adherence to the constitution of 1875 and to his selection of two successive ministers, Dufaure and Simon, for the supposed harmony of their views with the majority of the assembly; but that neither of them had been able to carry their measures by a majority; and that after these two attempts, equally devoid of success, he "could not take a step further in the

same path without appealing to, or demanding support from, another section of the republican party—that which thinks the republic cannot be firmly established without having, as a complement and consequence, the radical modification of all our great institutions—judicial, financial, and military administrations. This programme is well known. Those who profess it are agreed on all it contains," etc. . . . "Neither my conscience nor my patriotism permits me to share, even afar off and as regards the future, in the triumph of these ideas. I do not think it opportune, either to-day or to-morrow or at any period, that they should prevail. . . . I will neither try its application myself, nor facilitate its trial by my successors. As long as I am the depositary of power, I shall make use of it to the whole extent of its legal limits to oppose what I regard as the ruin of my country. But I am convinced that the country thinks as I do. It was not the triumph of these theories which it wished at the last elections." With much more of the same tenor, outspoken and decisive as to his distrust of the republic as outlined by Gambetta and the left, he decreed, by virtue of his power under the constitution, the adjournment of the chambers for one month. Within four days after the new ministry assumed office, prefects were changed in 62 departments, 225 out of 227 sub-prefectures received new offices, and all the influence and power of the government was developed to create a pressure of public opinion in its support. The day the message was read in the chambers, the deputies of the left, with Thiers at their head, prepared an address to the country, expressing the hope that "the nation will show, by its coolness, patience, and resolution, that an incorrigble minority cannot wrest from it its own government." Thus, the issue was fairly made up between the republicans and the bold and frank statement of the president that he wished to be supported in the singleness of his power. May 28, de Broglie, now chief minister, issued a circular, explaining that the president, in exercising his constitutional prerogative, intervened to arrest the progress of radical theories, etc., etc., and authorizing officers under the government to be vigilant to repress apologies for the commune and abuse of the president, and for the protection of morality, religion, and property. The president's new cabinet savored strongly of an intention to mold politics in France so as to promote the return of the young Napoleon to the imperial throne. Legitimists were excluded from it. June 11, their leader questioned the president as to the meaning of this action and as to a report, gaining credence, that he meditated a prolongation of his own power. They were assured that, "As to the legitimist candidates" (to the chamber of deputies), "they belong to the conservative groups, and any legitimist candidate really having any chance of success will be openly and loyally supported by the administration. With respect to schemes of prolonging my tenure of office during the prorogation, you may rest assured that I entertain none. I have received my right to remain in office until 1880 from the assembly, and I shall remain, unless a contingency I shall immediately point out to you shall arise. . . . I shall lend myself to no *coup de main* whatever. Let me also tell you that I shall lend myself to no venture of imperial, of monarchic restoration. . . . I shall participate in nothing favorable to the restoration, either of the prince imperial or of the comte de Chambord or of the comte de Paris. I am until 1880 invested with definite power by the constitution. I shall exercise that power, according to circumstances, to its full extent. . . . It will, perhaps, be necessary to demand a dissolution. If you accord it me, I shall use it as well as possible. If you refuse it, I should then have two forces out of three against me, and should withdraw."

When both chambers reassembled, June 16, the duc de Broglie ascended the tribune of the senate and read a message from the president asking their assent to the dissolution of the chamber of deputies. The message alluded to the manifesto signed by more than 300 deputies, protesting against the use made of his constitutional prerogative in proroguing the assembly, and to their appeals to their constituencies to oppose his measures, and deprecated the agitation which they were producing. It foretokened a prompt dissolution of the assembly, and an appeal to the country in a general election for new delegates. "Warned in time, guarding against all misunderstanding and ambiguity, France, I am sure, will do justice to my intention, and will choose for her representatives those who will promise to second me." To the chamber of deputies the president addressed a message, of which the following is a part, which was read from the tribune by Fortou, minister of the interior: "The president of the republic remains convinced, after two sincere but fruitless trials, that no ministry can hope to muster a durable majority in this assembly without asking to be backed by the party which professes radical doctrines, and without thereby promoting the progress of them. Full of respect for the institutions which govern us, and resolved to maintain them intact, he thinks himself entitled to employ all the prerogatives which they gave him to resist another step being taken in a path which seems to him to lead to the ruin and degradation of the country. He has chosen ministers who share his idea in this respect, and assume in the eyes of France the responsibility of it." The debate which followed between Fortou, Gambetta, and Decazes was stormy, and the right undertook to stifle it with their turmoil. The vote on the dissolution passed the senate by 150 to 130. The chamber of deputies was therefore dissolved, and by the same decree fresh elections for the new chamber were ordered within three months. The 363 deputies who joined in a protest against the first prorogation of the chamber, united to offer themselves as

one body for re-election. Nothing in politics can exceed the frankness of both parties in stating their positions and the clearness with which the issue was placed before the country. The canvass which followed was the most vigorously contested that had ever taken place in France. The republicans of all shades united on single candidates. The president was not so successful in securing unity of action, though the government pressure was used with an open energy that made its servants feel that they must leave nothing undone. The minister of the interior, Fortou, in his circular to them, said: "Functionaries of every kind are knit to the government which has appointed them by ties which they are bound not to forget. We cannot permit any of them to be hostile to us. Any who will use against the government the authority which they hold from it, need expect neither toleration nor indulgence." The death of M. Thiers, Sept. 3, was momentarily a blow to the republicans, but was turned to a source of strength by the grateful feelings of all France in reviewing his life, and by the knowledge that his hand had sketched the plan of the campaign against the measures of president MacMahon. On Sept. 19 the latter issued a manifesto to the French people, in which he drew the line against the "radicals," and called upon Frenchmen to sustain him personally in defense of the constitution and conservatism. The address was answered by one from Thiers, which, though prepared before his death, was suitable to the occasion. He pictured—as with a hand stretching from the tomb—how all the words recently used to create fear of the republicans had been used by every ruler who had by turns used and abused the confidence of the people of France. The means taken by the government of MacMahon to carry the election as the day approached were more tyrannical. Gambetta's expression that after the election "the president would have to submit or resign," brought him a penalty of three months' imprisonment and 4,000 francs fine.

The election, Oct. 14, resulted in a republican victory, by the return of 315 to 199 of the government candidates. The new chambers met Nov. 7, and elected Jules Grévy president. The government was at once called to account for its abuse of the system of official candidatures, and de Broglie was ready for the question. On the 20th the president changed his ministry again, to eliminate those whom the popular verdict had made without power in the chamber, and nominated men of moderate views who had not become obnoxious to the country. The following statement, made by gen. Grimaudet de Rochbouet, the newly appointed minister of war and "president of the council, was an illy conceived defiance of the republican sentiment. . . . . President McMahon has intrusted the ministry to men outside the political struggle. They will faithfully observe the law, and afford the marshal the support which he requires to facilitate commercial intercourse and the preparations for the exposition. We shall respect and require respect for the republican laws by which we are ruled. The constitution will pass intact from us to our successors *when president MacMahon judges opportune to replace us by parliamentary ministers.*" Jules Ferry moved "that the chamber consider that the ministry, by its composition, is a denial of the national rights of parliamentary law, and declined to enter into relations with it;" which was carried by 323 to 208. MacMahon's new effort to maintain his personal government under the constitution was thus signally unsuccessful; and Dec. 14, 1877, he yielded to the republicans, and gave Dufaure full power to form a cabinet from the left. Peace was thus restored; and the assembly, after passing essential appropriate bills, adjourned a week after the new ministry came into power. Eighty-two prefects were changed to represent the new republican control. On the reassembling of the chambers Jan. 8, 1878, de Rumilly, president of the senate, alluded to the president's message of December, as showing that he was not a tool of the ministers of the 16th of May.

In succeeding elections the republicans gained largely, and MacMahon seemed to conform so loyally to the verdict of the country against his former policy that Gambetta supported a motion of confidence in the executive council, which passed the chamber by a vote of 436 to 34. So strong was the reaction in the president's favor that, about this time, the republicans suggested him as an available candidate for a second term. MacMahon had the honor of opening and closing the great exposition of Paris of 1878. By the perfect order of the city, its marvelous cleanliness, and the harmony in the working of all the departments of the government, France showed that the republic had at last settled into a permanent beneficence. On the assembling of the chambers, Jan., 1879, a difference occurred between the president and his prime minister, Dufaure, concerning a decree for the removal of government subordinate officials not in sympathy with the republic. He yielded to his ministers on the civil lists prepared by them for removal, but when it came to the officers of the army designated to be superseded he refused, and declared he would rather resign. The council of ministers remained firm, and insisted on the removals. At 1 P.M., Jan. 30, the marshal sent in to the council his formal resignation as president of the republic. The ministers in council then offered their resignations, conditioned that he could form another ministry that would satisfy the chambers without executing their decrees of Jan. 20. The president replied in effect that he did not believe that possible. In the afternoon of the same day the ministers presented to the chambers the letter of resignation of the president. It contained these words: "The cabinet, in the belief of responding to the majority in the two chambers, now proposes to me, as regards the great commands, general measures which I deem contrary to the interests of the army, and consequently to those of the country. I

cannot subscribe to them. In view of this refusal the cabinet resigns. Any other cabinet taken from the majority of the chambers would impose the same conditions on me. I accordingly . . . . . resign the presidency of the republic. In leaving office I have the consolation of believing that, during the fifty-three years I have devoted to the service of my country as a soldier and as a citizen, I have never been guided by other sentiments than those of honor and duty, and by perfect devotion to my country." At 4.30 P.M. the two chambers assembled for joint-action to elect a president. Jules Grévy received 563 out of 713 votes, and was declared elected. Thus, within three hours and a half, the change in the executive head of the government had been made in accordance with constitutional forms, and marshal MacMahon retired to private life honored by all parties. In March following, when the question of the impeachment of the de Broglie ministry was under discussion in the chambers, marshal MacMahon wrote to president Grévy a letter, assuming the responsibility of the acts of his ministers of May 16, 1877, and claiming that, if they were to be impeached, he must be placed with them. The impeachment project was negatived. The ex-president is still living (1881), and regarded as an honest and able man, whose military education and life unfitted him, to a certain degree, to understand a republican form of government, and that order and stability among a people do not altogether depend on force or require a military *régime* to insure them.

McMICHAEL, MORTON, 1807–79; b. in Burlington co., N. J.; began at an early age to write for the press, and in 1844 became editor-in-chief of the Philadelphia *North American*, a daily journal of wide influence. He was an able writer and an eloquent speaker, and as a politician wielded a large influence. He was mayor of Philadelphia from 1865 to 1868, and died in that city.

MACMILLAN, HUGH, LL.D., b. Scotland, 1833; educated at Breadalbane academy and Edinburgh university. He was minister of the free church in Kirkmichael, Perthshire, in 1859, and five years later was transferred to the free St. Peter's church in Glasgow, where he remains. He has published *Bible Teachings in Nature* (1866), a work which met with great success, and has been translated into several continental languages; *First Forms of Vegetation; The True Vine; The Ministry of Nature; The Garden and the City; Sunglints in the Wilderness; The Sabbath of the Fields*, which has been translated into Danish and Norwegian; and *Our Lord's Three Raisings from the Dead*. He has also been a prolific contributor to periodical literature. He is an LL.D. of the university of St. Andrews.

McMINN, a co. in s.e. Tennessee; 480 sq.m.; pop. '80, 15,064. It is drained by the Hiawassee river and Chestna creek, and traversed by the Tennessee, Virginia and Georgia railroad. Corn and whisky are the staples. Capital, Athens.

McMULLEN, a co. in s.w. Texas, traversed by the Nueces and Frio rivers; 1250 sq.m.; pop. '80, 701. The breeding of stock is almost the only industry. The only town is McMullen.

McMURROGH, DERMOT, King of Leinster, Ireland. He became king in 1140, but was expelled by his subjects in 1168. Henry II. of England refused to aid him, but Richard de Clare, earl of Pembroke (surnamed Strongbow), restored him to power in 1170. The earl married the daughter of the king, and when the latter died, in the same year, the former succeeded him as king and as a vassal of England; laying thus the foundation of the English claim of supremacy in Ireland.

McNAB, Sir ALAN NAPIER, 1798–1862; entered the royal navy as a midshipman in 1813, and took part in the British expedition against Sackett's Harbor and other American towns. He left the navy, and became an ensign in the army, commanding the advance at the battle of Plattsburg. At the close of the war 1812–15 he remained in Canada, studied law, and was admitted to practice at the Canadian bar. He was elected to the legislature, became speaker of the legislative assembly, and prime minister in the government of the earl of Elgin, and that of sir Edmund Head, which followed. He was prominent in sustaining the government against the insurrection of 1837–38, being appointed col. of militia. While in command at Niagara he ordered the seizure of the steamer Caroline, which was conveying supplies to the rebels, from the American side, set fire to her, and sent her over Niagara Falls. This daring act was approved by the British government, and McNab was rewarded for it by being knighted. In 1841 he was speaker of the legislature; in 1858 was made a baronet; and in 1860 became a member of the legislative council.

McNAIRY, a co. in s.w. Tennessee, watered by affluents of the Big Hatchie river, and reached by the Mobile and Ohio, and Memphis and Charleston railroads; 620 sq.m.; pop. '80, 17,271. The productions are Indian corn, wheat, oats, wool, cotton, and sweet potatoes. A large proportion of this county is covered with a dense growth of ash, chestnut, hickory, oak, and other timber. Co. seat, Purdy.

MACNEIL, HECTOR, 1746–1818; b. Scotland; educated by his parents at home, and at a commercial school in Glasgow. After spending some time in the mercantile house of one of his relatives at Bristol he sailed for the West Indies, where he remained for six years. Some two years after his return to England, having lost the little property left him by his father, he secured the place of assistant secretary on the flag-ship of

admiral Geary; and afterwards held the same position on the flag-ship of sir Richard Bickerton, with whom he sailed to the East Indies. While in India he visited the sculptures at Elephanta, which he described in *Archæologia* for 1787. He spent five years in India, and on his return to Scotland settled near Stirling, and composed his poem called *The Links of Forth*. He next went to Kingston, Jamaica, to accept an office in the custom-house there, but ill-health compelled him to return, and on the homeward voyage he wrote a canto of his poem *The Harp*. For the next six years, still suffering from ill-health, he lived in retirement near Bannockburn, and composed *Scotland's Skaith*, his best work, published in 1795. At the end of this period he again sailed for Jamaica, where he recovered his health; and about the same time he received a legacy sufficient to enable him to live at ease for the rest of his life. He had written *The Scottish Muse*, a sort of poetical autobiography, while in Jamaica; and at Edinburgh, which he made his home henceforth, he published in 1812 *The Pastoral or Lyric Muse of Scotland;* in 1810 two satires under the name of *Town Fashions;* in 1811 *Bygone Times and Late Come Changes;* and in 1812 *The Scottish Adventurers*, an historical novel.

McNEIL, JOHN, 1784–1850; b. N. H.; capt. and afterwards maj. in the 11th regiment U. S. infantry in the war of 1812. The battle of Chippewa, July 5, 1814, was mainly decided in favor of the Americans by the bayonet charge made by McNeil's regiment, to whose command on that day, after the death of its col., he succeeded. For his gallantry in that action, and at Lundy's Lane, July 25, where he was severely wounded, he was brevetted lieut.col. and col. He continued in the service till 1830, was brevetted brig.gen. in 1824, and made col. of the first regiment of infantry in 1826. In 1829 he was made surveyor of the port of Boston, and retained that office till his death.

McNEILE, HUGH, D.D., 1795–1879; b. at Ballycastle, Antrim, Ireland; educated at Trinity college, Dublin, where he received the degrees of M.A. and D.D. in after years. He studied for the law, but in 1820 took orders, and after holding several preferments, was made canon of Chester, and in 1868 dean of Ripon. He was a popular preacher, of powerful diction and elegant delivery. Among his published works are lectures on the *Church of England, Prophecies of the Jews*, and sermons on the *Second Advent*, and many other topics.

McNEILL, Sir JOHN, D.C.L., b. Scotland, 1795; assistant ambassador to the Persian court in 1881, secretary of the Persian embassy in 1834, and envoy extraordinary to the Persian court in 1836. On his return to Great Britain in 1844 he was made chairman of the committee appointed to take charge of the operation of the Scotch poor-law act; and in 1851 he made a report to the government upon the condition of the western Highlands and islands. Four years later, under the Palmerston administration, he was put at the head of the board of inquiry appointed to investigate the proceedings of the commissary department during the Crimean war; and for his services in that capacity, he was sworn in of the privy council. He published in 1854 *Progress and Position of Russia in the East to* 1854.

McNEILL, WILLIAM GIBBS, 1800–53, b. N.C.; graduated at West Point, and entering the army, was attached at first to the artillery, and afterwards to the topographical engineers. He resigned from the army in 1837, and took up the profession of a civil engineer, in which he was eminently successful. He was chief engineer of a number of railroads, and of the dry dock in the navy-yard at Brooklyn. He assisted in making the survey for the Baltimore and Ohio railroad, and was president of the Chesapeake and Ohio canal company.

MACNEVEN, WILLIAM JAMES, 1763–1841, b. Ireland; studied medicine at Vienna, and practiced at Dublin. He was a member of the "United Irishmen," and for his participation in the designs of that organization was arrested in 1798, and imprisoned. Released in 1802 he traveled through Switzerland, writing a description of his travels in his *Ramble through Switzerland*. Soon afterwards he took a commission in the Irish brigade attached to the French service. Finding that his expectations of a French invasion of Ireland were baseless, he threw up his commission, and went to New York, where he resumed the practice of his profession. He was one of the editors of the New York *Medical and Philosophical Journal;* from 1808 to 1830 a professor in the college of physicians and surgeons, and at the medical school connected with Rutgers college in New Jersey. He published *Exposition of the Atomic Theory*, and *Pieces of Irish History*.

MACNISH, ROBERT, 1802–37; b. Glasgow, where he passed his life in practice as a physician. He contributed to *Blackwood's* and *Frazer's Magazines*, and became very popular. He published *The Metempsychosis*, 1825; *The Anatomy of Drunkenness*, 1827; *The Philosophy of Sleep*, and other works.

MACOMB', a co. in e. Michigan on lake St. Clair, traversed by Clinton river and the Grand Trunk railroad; 375 sq.m.; pop. '70, 27,616; co. seat, Mt. Vincent. The products are all the cereals, wool, butter, and hay. There are some manufactures.

MACOMB', a t. and vill., the capital of McDonough co., Ill., on the Chicago and Quincy railroad, 200 m. from Chicago; pop. of vill., 2,748; of t. 4,313. The McDonough normal college is here, and the place has good schools, a fine court-house, 3 newspapers, 2 banks, a foundry, and several wagon and carriage manufactories.

MACOMB', ALEXANDER, 1782–1841, b. Mich., entered the cavalry service of the United States in 1799, and rose to be lieut.col. of engineers and adj.gen. When the second war with England broke out he was transferred to the artillery at his own request, and in 1813, at the head of the 3d artillery, was at fort Niagara and the surrender of fort George. In January of the next year he was made a brig-gen. commanding the n. frontier along lake Champlain. In September of the same year he successfully defended Plattsburg, which was besieged by sir George Prevost, who had invaded New York with a force of 12,000 men. Upon the same day that Plattsburg was attacked, the British fleet on lake Champlain was defeated by commodore McDonough, and the British army retreated to Canada forthwith. For his conduct at Plattsburgh Macomb was made a maj.gen, and congress voted him its thanks and a gold medal, in recognition of his services. After the war he was commissioned a col. of engineers in the regular army, of which he became commander-in-chief in 1835. He was the author of *A Treatise on Martial Law.*

MACOMB', WILLIAM H., 1820–72, b. Michigan; entered the U. S. navy in 1834, and was appointed lieut. in 1847. He was on the *Plymouth* when the Chinese forts were bombarded in 1856, and was made a commander in 1862. He was on duty at various points on the Mississippi river through the year 1863, and in 1864 at the head of a squadron of gunboats took possession after a sharp struggle of Plymouth, N. C.; and was officially thanked by the navy department for his conduct on that occasion. He was appointed commodore in 1870.

MACON, an e. co. of Alabama, watered by branches of the Tallapoosa river, intersected by the Montgomery and West Point railroad; 700 sq.m.; pop. '80, 17,373. The surface is varied and the soil fertile; productions are Indian corn, rye, cotton, rice, sweet potatoes, and oats. Co. seat, Tuskegee.

MACON, a co. in s.w. central Georgia; drained by Flint river, and many creeks; traversed by the South-western railroad; 370 sq.m.; pop. '80, 11,675. The principal products are corn and cotton; chief town, Oglethorpe.

MACON, a co. in central Illinois, traversed by the Illinois Central, and Toledo, Wabash and Western railroads, and by a fork of the Sangamon river; 549 sq.m.; pop. '80, 30,672. The surface is level, and the soil fertile. The productions are tobacco, wool, cotton, Indian corn, wheat, Irish and sweet potatoes, and butter. There are a large number of manufactories, chiefly of agricultural implements and carriages. Co. seat, Decatur.

MACON, a co. in n.e. Missouri, traversed by Chariton and the e. fork of Salt rivers, and by the Hannibal and St. Joseph, and Northern Missouri railroads; 830 sq.m.; pop. '80, 26,223; co. seat, Macon city. There are mines of iron, lead, and coal, the latter very plentiful. Grain and tobacco are the chief products. The soil is well watered and fertile.

MACON, a co. in s.w. North Carolina, on the boundary line of Georgia, drained by the head-waters of the Tennessee river, having the Blue ridge range of mountains on the s.e.; 600 sq.m.; pop. '80, 8,064. The surface is generally elevated, and the soil is fertile, producing wheat, Indian corn, oats, Irish and sweet potatoes, tobacco, wool, butter, and hay. Co. seat, Franklin.

MACON, a co. in n. Tennessee, bounded by Kentucky on the n.; watered by branches of the Cumberland and Big Barren rivers; 260 sq.m.; pop. '80, 9,274. It has a varied surface, and fertile soil in most parts; and produces largely of tobacco, besides Indian corn, wheat, oats, Irish and sweet potatoes, cotton, etc. Co. seat, Lafayette.

MACON, a city of Georgia, U. S., at the head of the navigation, and on both sides of the river Ocmulgee. Pop. '70, 10,810.

MACON (*ante*), chief t. of Bibb co. in s. central Georgia; in size the fourth city of the state; pop. '80, 12,748. It is pleasantly situated on both sides of the Ocmulgee river, 85 m. s.e. of Atlanta and 30 m. s.w. of Milledgeville, on the Georgia Central railroad. It has a number of iron and other manufactories, 3 newspapers, 7 churches, and 6 banks. It is the seat of the Wesleyan college for women, and Mercer university. It is especially noted for the taste with which its streets and parks are laid out, and the great abundance of its shade trees. Several artificial mounds are found in the vicinity.

MACON, chief t. in Macon co., Mo., 175 m. from St. Louis, at junction of the Hannibal and St. Joseph, and St. Louis, Kansas City and Northern railroads; pop. '70, 3,678. It has 2 banks, 4 weekly papers, a factory, several schools and churches, and does a good country trade.

MACON (ancient *Matisco*), a t. of France, capital of the department of Saône-et-Loire, on the right bank of the Saône, 38 m. n. of Lyons. Macon carries on an extensive trade in wines known as Macon, as well as in corn, cattle, etc., and there are various manufactures. Pop. '76, 16,579. Macon has some Roman antiquities.

MACON, NATHANIEL, 1757–1837, b. N. C.; educated at the college of New Jersey, where he was an undergraduate when the revolutionary war broke out. Leaving Princeton in 1777 he enlisted as a private soldier in a volunteer company, but

after a short term of service returned to his home in North Carolina, where he began to read law. But he soon abandoned his legal studies, and declining all offers of a commission re-enlisted as a private in the regiment of his brother, col. John Macon. He remained in the army as a common soldier without pay till the treaty of peace in 1782; and at the close of the war could not be prevailed upon to accept any compensation or pension for his service. While the war was still going on he had been elected, though but 23 years of age, a member of the senate of his native state; and he retained his seat for five successive years. He served on some of the principal committees of that body, and he was conspicuous in his advocacy of measures to maintain the credit of the state, and to redeem and withdraw from circulation the paper currency. About this time he removed to a plantation on the Roanoke river, and devoted to agriculture all of his time left free by the care of public affairs. When the adoption of the new U. S. constitution came before the people of North Carolina, Macon opposed its ratification, as conferring too great powers upon the general government. He was a member of congress 1791–1815, and its speaker 1801–06. He was twice offered, by Jefferson, the office of postmaster-general, but refused it. He was chosen to the U. S. senate in 1816; was its president *pro tem.* 1825–27; and resigned his seat in 1828. While in congress he was in favor of the embargo, and was a qualified supporter of the war with England; but he would not vote for appropriation to increase the navy beyond a point sufficient to protect our line of coast, nor sanction the construction of additional forts. Throughout his congressional career he steadily opposed the policy of internal improvements. In 1824 he voted against the bill to make Lafayette a grant out of the public lands in consideration of his services in the revolution. The same year he received the electoral vote of Virginia for the office of vice-president. In 1835 he was president of the North Carolina constitutional convention, where he opposed state aid to internal improvements, a property qualification for the suffrage, and the extension of the right of suffrage to free negroes. The last public office which he accepted was that of a presidential elector in 1836.

MÂCONNAIS, the name of an ancient department of France, in the kingdom of Bourgogne, or Burgundy, and corresponding with what is now the arrondissement of Mâcon. It was conquered by Julius Cæsar from the Ædui, and fell into the hands of the Burgundians in the 5th century. It afterwards became a part of the empire of Charlemagne; St. Louis (IX.) purchased it in the 13th c., and united it to the domains of the crown; but in the middle of the next century it fell into the hands of the duke de Berry; then the crown obtained possession of it again; it was given to Philip the good, duke of Burgundy, by Charles VII.; and in 1477 again reverted to the crown. Capital, Mâcon.

MACOU'PIN, a co. in central Illinois; 864 sq.m.; pop. '80, 37,705; traversed by the Chicago and Alton, and Indianapolis and St. Louis railroads. The soil is fertile and diversified; there is some coal-mining, but the staple products are wool, grain, and cattle.

MACOY'A or MACAHUBA PALM, a South American and West Indian palm, called also macahuba palm and great macaw tree. It yields an oil used in making soap, to which it imparts a pleasant perfume. It is also used as an embrocation in rheumatism and other painful affections. It may be combined with hartshorn, when it forms a white liniment.

MACPHERSON, a co. of central Dakotah, 1260 sq.m.; recently formed. It is watered by the Maple and Elm rivers, branches of the Dakota. The surface is generally elevated, and in the w. part is the plateau du coteau of the Missouri.

McPHERSON, a co. of central Kansas, watered by the Smoky Hill and Little Arkansas rivers; 1080 sq.m.; pop. '80, 17,143. It comprises prairie lands, with a fertile soil, producing wheat, Indian corn, potatoes, and hay, and well adapted for stock-raising. Co. seat, Lindborg.

McPHERSON, EDWARD, LL.D., b. Gettysburg, Penn., 1830; graduated at Pennsylvania college in 1848; entered the profession of journalism at Harrisburg, Penn., and was elected to congress in 1858, serving a single term. He was clerk of the U. S. house of representatives from 1863 to 1869; secretary of the union national committee from 1860 to 1864; president of the republican national convention at Cincinnati in 1876; and is at present editor-in-chief of the Philadelphia *Press*. He has the repute of the foremost American political statist, having published a *Political History of the United States* and a *Political Manual*, and edited several numbers of *The Tribune Almanac*.

MACPHERSON, JAMES, a person who has obtained a remarkable notoriety in literature, was b. in 1738, at Ruthven, in Inverness-shire. After finishing his studies at King's college, Aberdeen, he became a schoolmaster in his native village, published a poem entitled *The Highlander* in 1758, contributed about the same time verses to the *Scots Magazine*, and in the following year, having met with the rev. Dr. Alexander Carlyle, minister of Inveresk, and John Home, the author of *Douglas*, he showed them some fragments of Gaelic verse, of which he also gave them "translations." These "translations" (16 in number) appeared in 1760, and were so much relished, that the faculty of advocates in Edinburgh raised a subscription to enable Macpherson to make a tour through the Highlands for the purpose of collecting more of the same. Macpherson was very zealous and successful in the "discovery" of literary treasures. *Where* he made his discoveries, however, no man knows. He found ancient MSS. in regions where no one before

had suspected their existence, and where no one since has been fortunate enough to obtain them. The result was the appearance at London, in 1762, of the so-called "Poems of Ossian," under the title of *Fingal, an Epic Poem, in Six Books;* and in 1763, of *Temora, an Epic Poem, in Eight Books.* A storm of controversy soon arose in regard to their genuineness, which has hardly yet subsided, but on the whole, we may safely say the verdict is unfavorable to Macpherson. See OSSIAN, POEMS OF. These poems were, however, the making of him in a worldly point of view. He was appointed surveyor-general of the Floridas (in 1764) with a salary for life, and agent to the nabob of Arcot—a very lucrative office—in 1779; entered parliament in the following year as member for Camelford, sat for ten years, and then retired to an estate which he had purchased in Inverness-shire, where he died Feb. 17, 1796. His body was brought back to England, and was actually interred (at his own request and expense) in Westminster abbey. Macpherson wrote in the latter half of his life a variety of historical compilations, pamphlets, etc., and translated Homer's *Iliad* into prose.

McPHERSON, JAMES BIRDSEYE, 1828–64; b. Ohio; graduated at West Point in 1853, and was appointed to the engineers. For a year after his graduation he gave instruction in engineering at the academy, and was next engaged as assistant engineer upon the defenses of the harbor of New York, and the improvement of Hudson river. In 1857 he superintended the building of fort Delaware, and of the fortifications in the harbor of San Francisco. In 1861, having been made first lieut. three years previous, he was assigned to duty at Boston, where he raised a force of engineers; and in Aug. of the same year he was promoted to a captaincy of engineers. The following Nov. he was made assistant engineer of the department of the Missouri, with the rank of lieut.col. Made chief engineer on the staff of gen. Grant, he took part in the capture of fort Donelson, Feb. 19, 1862, and in the battle of Shiloh, April 6, 7. In May he was appointed brig.gen. of volunteers, and col. in the regular army. He was with Halleck at the "siege of Corinth;" and when, after its capture by the federal forces, the confederates with a force of nearly 40,000 men, under Van Dorn and Price, attempted to retake it in Oct., 1862, McPherson succeeded in penetrating their lines and reinforcing Rosecrans, who had fortified Corinth with additional defenses, and was holding it with 20,000 men. For his services at Corinth, McPherson was promoted maj.gen. of volunteers, Oct. 8, 1862. In December he was put at the head of the 17th corps, and he had a most distinguished share in Grant's Mississippi campaign, which terminated in the surrender of Vicksburg. He led the advance up the left bank of the Big Black river, defeating the confederates at Raymond, May 12, 1863. The 17th corps was at the front of every movement in the campaign; it drove the confederates from their position at Port Gibson, after an all day's fight; it was engaged in almost continual skirmishes from the bayou Pierre to the Big Black river; it won the battle at Raymond without any aid from the rest of the army; and two days afterwards, with the help of Sherman's corps, which had joined Grant early in the month, it won another battle at Jackson. McPherson's corps was likewise conspicuous in the repulse of Pemberton at Champion hills, May 16, in the unsuccessful assault by the federal army before Vicksburg, May 22; and throughout the siege. After the capture of Vicksburg, McPherson was appointed a brig.gen. in the regular army, and commander of the district of Vicksburg. In Feb., 1864, he was next in command to Sherman in the latter's expedition to Meridian; and Mar. 12 was made commander of the army and department of the Tennessee. In that command, he kept up the reputation he had won in Mississippi, and rendered the most valuable services during Sherman's campaign in Georgia. The army of the Tennessee engaged the confederates at Dallas, May 28, 1864; and June 27, McPherson and Thomas made an unsuccessful assault upon Johnston's position at Kenesaw mountain. Early in July, Johnston abandoned Kenesaw, and retreated in the direction of Atlanta, closely followed by the federal forces. The confederates now took the offensive, and made almost daily attacks upon the union army; and in one of these, July 22, 1864, McPherson was killed. Gen. Grant, in a letter recommending him for promotion, in 1863, praises him as "one of the ablest engineers and most skillful generals."

MACQUA'RIE, a river of e. Australia, rises about 80 m. w. of Sydney, in the co. of Westmoreland, and has a n.w. course of 280 miles. Its waters are lost in marshes, whence issue tributaries of the Darling, of which river the Macquarie may be said to be one of the head waters.

MACQUER, PIERRE JOSEPH, b. at Paris in 1718, of a family originally Scotch, has acquired a reputation as a chemist and physician. He died Feb. 15, 1784. Macquer's principal works are *Eléments de Chimie théorique* (Par. 1741); *Eléments de Chimie pratique* (Par. 1751); and a *Dictionnaire de Chimie* (Par. 1776). See GASES.

MACRAUCHENIA, a genus of extinct ungulate animals allied to the tapirs, found in the tertiary deposits of Buenos Ayres and Patagonia. See PERISSODACTYLS.

MACREADY, WILLIAM CHARLES, an English tragedian, whose father was a manager of a provincial company, was b. in London Mar. 3, 1793, educated at Rugby, and made his first appearance as Romeo at Birmingham in 1810. For four years he was connected with his father's company, and for two years thereafter he sustained leading parts in the provinces. In Sept., 1816, he made his first appearance before a London audience, and

gained the applause of Kean, who was one of his auditors. His progress in the higher walks of the drama was slow, principally, it is understood, from professional jealousies. In 1819 he made a hit in the character of Richard III., and he afterwards adventured on other of Shakespeare's characters with success. In 1826 he made a tour in the United States, and he visited Paris in 1828. He became lessee of Covent Garden theater in 1837, and relinquished it two years thereafter. He afterwards undertook the management of Drury Lane, but gave it up after encountering considerable pecuniary loss. He visited America for a second time in 1843–44; and again in 1848–49, when he barely escaped with his life from a riot which took place in the theater at New York, caused by the jealousy of Mr. Forrest, an American actor. On his return home he was engaged at the Haymarket, and his theatrical career was brought to a conclusion on Feb. 3, 1851. He took his benefit at Drury Lane on the 26th of the same month. Shortly afterwards, a public dinner was given to the great actor, which was attended by 600 guests, and presided over by sir E. L. Bulwer. Macready died April, 1873. *Macready's Reminiscences and Selections from his Diaries and Letters* appeared in 1875.

Macready was a fine and impressive actor, but he was more indebted for his success to art than to nature. He succeeded best in the graver characters of the drama. He inherited more of the stateliness of Kemble than the fire of Kean.

McREE, WILLIAM, 1788–1832, b. Wilmington, N. C.; graduated at West Point in 1805; entered the army as second lieut. of engineers, and rose by regular promotion to the rank of lieut.col. in 1818. Prior to 1812 he was employed in the survey and construction of fortifications on the Atlantic coast. In the war of that period with Great Britain he served first as chief of artillery in gen. Hampton's northern army, and later as chief engineer of the army of gen. Brown, winning distinction in the capture and defense of fort Erie, and in the battles of Chippewa and Niagara, for which he was successively brevetted lieut.col. and col. After the war was over he visited Europe with maj. Thayer, under direction of the government, for professional observation and the purchase of professional works. After his return, in 1816, he was made a member of the board of engineers to which was assigned the duty of preparing a system of defenses for the Atlantic coast. He was engaged in this service until 1819, when the French engineer, gen. Barnard, was appointed "assistant engineer of the United States." Sharing with other officers of his corps the feeling that it was unjust to overlook the merits and claims of American officers and appoint a foreigner over them, he resigned. He afterwards rendered valuable service as surveyor-general of Illinois, Missouri, and Arkansas. Died in St. Louis.

MACRI'NUS, M. OPELIUS, 164–218 A.D., a native of Mauritania; became pretorian prefect under Caracalla, whom he assassinated on the expedition against Parthia in 217 A.D. He was at once chosen emperor by the army, and the senate confirmed the choice. He fought the Parthians, neither side gaining a decisive victory; made terms with them and returned to Antioch. His severe discipline aroused the anger of his soldiers, who were also united by the relatives of Caracalla, and after a reign of 14 months he and his son were put to death at Chalcedon and Heliogabalus ascended the throne.

MACRO'BIUS, AMBROSIUS AURELIUS THEODOSIUS, a Latin grammarian of the 5th century. He appears to have been by birth a Greek, but literally nothing whatever is known of his life. Two of his works remain, entitled *Commentarius ex Cicerone in Somnium Scipionis*, and *Saturnaliorum Conviviorum Libri Septem.* The former is the best known, and was much read during the middle ages; the latter is in the form of a dialogue, and contains many valuable historical, mythological, antiquarian, and critical observations. Of a third work, *De Differentiis et Societatibus Græci Latinique Verbi*, we possess only extracts made by one Joannes—thought by Pithou to be Joannes Scotus—in the 9th century. It has been warmly discussed—as if it were of consequence to mankind—whether Macrobius was a Christian or a pagan. The evidence for his being the former is that he speaks of God as *omnium fabricator* (the maker of all things), which must be reckoned as extremely slender; and of the latter his great admiration for the piety and wisdom of one Prætextatus, a heathen priest, and his reverence for Greek divinities. The *editio princeps* of Macrobius appeared at Venice in 1472; of later editions, the best is that of Gronovius (Leyden, 1670), reprinted by Zeunius at Leipzig in 1774.

MACROPIDÆ, a family of marsupial animals including the kangaroos and kangaroo rats. See KARGAROO and MARSUPIALIA *ante.*

MACROOM', a post and market town of the county of Cork, Ireland, situated on the river Sullane, 21 m. w. from Cork, with which it is connected by railway. The pop. in '71 was 3,193. The town consists merely of a single street, nearly a mile long, and contains some good houses and shops, but the great majority of the dwellings are mean and poverty-stricken.

McSPARRAN, JAMES, D.D., 1695–1757, b. in the n. of Ireland, and came to Narragansett, R. I., in 1721, as a missionary of the Episcopal society for the propagation of the gospel in foreign parts; was an intimate friend of bishop Berkeley at Newport; visited England in 1736; was an eloquent and popular preacher; wrote *America Dissected*, a historical and geographical treatise, which Updike has republished in his *History of*

the Episcopal Church in Narragansett, R. I. He was engaged at the time of his death upon an extended history of the colonies.

MACTRA, a genus of lamellibranchiate mollusks, having a somewhat triangular shell, broader than long, the valves equal; the animal with the siphons united to the extremity, and a large compressed foot. They are sometimes called trough shells. The species are numerous, and widely distributed; they burrow in the sand and mud of sea-shores, and of the bottom of the sea. The foot enables them also to move with activity, after the manner of cockles. Some of the species have shells of considerable beauty, others are coarse. Several small species are very abundant on the British shores, so that in some places they are gathered for feeding pigs, but not by those who have much regard to the quality of the bacon. The fossil species are few. The genus mactra is the type of a family, *mactridæ*.

McTYEIRE', Holland Nimmons, b. S. C., 1824; graduated at Randolph-Macon college, Virginia, in 1844, in which year he entered the ministry. He became pastor of a church (Methodist Episcopal) in Mobile, and in 1847 married Amelia Townsend, cousin of the widow of the late Cornelius Vanderbilt, whose family were members of his pastoral charge. During the years between 1848 and 1858 he was appointed to churches in New Orleans, and distinguished himself by being among the few pastors who remained with their people during the yellow fever epidemics which devastated that city. In 1851 he was made the first editor of the New Orleans *Christian Advocate*. In 1858 he was called to Nashville, Tenn., to take editorial charge of the central organ of the Methodist Episcopal church, south, there published. At the general conference he was elected and consecrated bishop, and fixed his residence in Nashville. When Cornelius Vanderbilt founded the university named after him, situated at Nashville, he named bishop McTyeire as the first president of the board of trust controlling the affairs of the institution, and intrusted to him the fullest powers and discretion as to its establishment and control. The deed of gift contained the only instance on record of vesting the veto power in the president of a board of trustees. This was done by commodore Vanderbilt in the instance of bishop McTyeire, at once to signify his profound confidence in him personally, and perhaps not less to indicate his faith in a "one-man power." To the president of the new university fell the chief responsibility concerning all its details of construction, organization, and adaptation to its comprehensive uses. Its success has been the best evidence of the sound judgment displayed by the founder in his selection.

MA'CULÆ is the term given by Willan and Bateman, and some other dermatologists, to one of the orders of skin-diseases. The affections included in the term maculæ can, however, hardly be regarded as diseases; they are merely discolorations of the skin, resulting from some change in the production of the coloring matter. The following varieties are recognized.

1. *Lentigo.*—This term is applied to those small yellowish or brownish-yellow irregularly rounded spots which are denominated freckles, and which are most abundant on the parts chiefly exposed to the light, as the face, hands, etc. In some cases, these spots are congenital, while in other cases they seem to be produced by exposure to the sun's rays; and in both cases they chiefly occur to persons of fair complexion with light sandy hair. When patches of a larger size than that of ordinary freckles are produced by exposure to the sun, the affection receives the name of *ephelis*. Congenital spots cannot be removed by any applications; but those which depend on exposure may be treated with soothing lotions or liniments, as an emulsion of sweet almonds, or a mixture of lime-water with almond oil.

2. *Pigmentary Nævus.*—This is a congenital dark discoloration of the skin, with little or no elevation of the surface, and often covered with hair. It usually occurs in small spots, but sometimes appears in large patches. It is perfectly harmless, and should not be interfered with.

3. *Albinism* or *Leucopathy.*—This affection has been already noticed in the article Albinos. When congenital it may be considered irremediable, but cases of partial albinism, occurring after birth, may sometimes be relieved by local stimulants.

MacVEAGH, Wayne, b. Penn., 1833; educated at Yale college, where he graduated with a high rank in the class of 1853. He studied law in the office of James J. Lewis, at Westchester, Penn., and began practice in that town. As a boy he had already exhibited much force as a debater, and by his oratorical powers and keen argument he soon gained a high place among the members of the state bar, and was intrusted with several cases before the U. S. supreme court. At the outbreak of the civil war he volunteered, and was commissioned maj. of a cavalry regiment, but was soon forced to resign by ill-health. He resumed his practice and took a prominent part in politics, being chairman of the republican state committee in 1868. Shortly after he was appointed minister to Turkey by president Grant. Mr. MacVeagh soon became noted for the independence of his political views, and was an influential member of the young men's reform club of Philadelphia. On Mar. 5, 1881, president James A. Garfield sent in his name to the senate as attorney-general of the new cabinet, and the nomination was confirmed upon the same day.

McVICKAR, JOHN, D.D., 1787–1868; b. N. Y.; educated at Columbia college, and ordained to the ministry of the Protestant Episcopal church. He was rector of St. James's church in Hyde Park from 1811 to 1817, when he was elected professor of moral philosophy, rhetoric, and belles-lettres in Columbia college, where he remained till 1864, when he was made professor emeritus. He published, among other works, *Outlines of Political Economy*, 1831; *Early Years of Bishop Hobart*, 1834; *Professional Years of Bishop Hobart*, 1836.

McWHORTER, ALEXANDER, D.D., 1734–1807; b. New Castle co., Del.; graduated at the college of New Jersey in 1757; studied theology under William Tennent; was installed pastor of the Presbyterian church at Newark, N. J.; went on a mission to North Carolina in 1764; became chaplain in Knox's artillery brigade in 1778; in 1779 became pastor at Charlotte, N. C., and president of Queen's museum college, then called Liberty hall; returned to Newark in 1781; aided in preparing the constitution of the American Presbyterian church in 1788; was 35 years a trustee of the college of New Jersey; labored to collect funds in New England to rebuild his church that had been burnt in 1802; published a centennial sermon in Newark in 1800, and 2 volumes of sermons in 1803.

McWHORTER, ALEXANDER, b. New York, 1822; graduated at Yale college in 1842 and at the divinity school in 1845; was professor of English literature and metaphysics at the university of Troy from 1856 to 1860; author of *Yahveh Christ, or the Memorial Name*. Toward the last of his life his mind was disordered.

MADAGAS'CAR, an island situated to the s.e. of the African continent, and extending over an area larger than the British isles. It is in lat. 11° 57′ to 25° 38′ s., and long. about 43° to 51°; length, 1030 m., greatest breadth, 350 m.; area estimated at 225,000 sq. miles. Although well known to Europeans since the beginning of the 16th c., Madagascar has even now been imperfectly explored. The coasts were surveyed by capt. Owen between 1823 and 1825, and the outline of the island correctly laid down in our maps; but there has hitherto been a great lack of knowledge as to the geography of the interior. Most of the information we possessed was owing to a distinguished French explorer, M. Alfred Grandidier, who, in 1869 and 1870, crossed the island in several directions. Now, however, Dr. Mullens and Mr. Pillans have brought home some beautiful specimens of cartography, from which a new map of Madagascar has been prepared.

M. Grandidier states that Madagascar comprises two distinct parts—the northern, which is mountainous, and the south-western, which is comparatively flat. Five great mountain chains traverse the island, all in a n.n.e. and s.s.w. direction. The three chains farthest to the w. are prolonged southward, and belong to the secondary formation. They have a very sterile soil. The two eastern chains are prolonged northwards, and form a great mountain tract of granitic rocks. They form a rugged region on the eastern slope of the island. From the observations of Dr. Mullens, it is now discovered that the central provinces of Madagascar have been the scene of volcanic phenomena on an immense scale. The Ankárat mountains, forming an extinct volcanic center, cover an area of 600 sq. miles. In a region 25 m. from this range, Dr. Mullens and his companion visited and mapped more than 40 craters. Fifty m. to the s. are three groups of volcanoes. This volcanic belt is continued towards the n., and is evidently connected with that volcanic system of which Comoro is now the active vent. Madagascar has been celebrated for its luxuriant vegetation; but it appears that it is sterile and desolate in the central and south-western parts. In the n. and e. the climate is moist. Magnificent forests clothe the hills. Elsewhere this belt of vegetation forms a narrow skirt along the shore.

The climate is temperate and healthy in the highlands of the interior, but low fever renders the hot sea-coast undesirable as a residence for Europeans. The flora and fauna of Madagascar, although resembling those of Africa, and more remotely of India, are so peculiar as to form a region apart. They comprise many species, and even many genera nowhere else to be found. The number and variety of the *lemuridæ* is a prominent characteristic.

There has been much discussion about the branch of the human family to which the Malagash belong. M. Grandidier believes that three distinct races are to be recognized in the island—namely, the original inhabitants, allied to the negroes; the free inhabitants on the w. coast, resembling the white races; and a third race belonging to the Malay stock. Dr. Mullens believes that the Malagash or Malagasy are a single race of Malay origin, and divides them into three tribes—the Betsimasarakas, the Sakalavas, and the Hovas. He estimates the total pop. at 2,500,000. The Malagash language, spoken all over the island, contains such a number of Malay words that it has been classed with the languages spoken in the Malay peninsula.

The exports of Madagascar are horned cattle, and a small quantity of rice, shipped principally to Mauritius and Bourbon. The island is rich in iron, but the present means of working it are very deficient. At present, the only mode of traveling is in palanquins, borne on the shoulders of men; and the paths by which this simple method of journeying is performed are often so bad as to cause much delay. Madagascar is now divided politically into two nearly equal parts: 1st, that n. of 22° s lat. and e. of 46° e. long., which is dependent on the Hovas; and 2d, the remainder of the island. The first part

is by far the richest and most fertile, and is peopled by seven-eighths of the whole population. The French retain possession of the island of Ste. Marie, on the n.e., and Nossi Be on the n.w. coasts. The capital of Madagascar is Tananarivo, with a pop. of 80,000.

The early history of Madagascar is involved in obscurity. It is supposed to have been known to the ancients, by whom it was generally considered as an appendage to the mainland. When it was invaded and peopled by the Malays, from whom the Hovas descend, is unknown. It was referred to in the 13th c., by Marco Polo as Madgastar or Madaigascar. In 1643 the French took possession of the Ile Ste. Marie, and thus formed a connection with Madagascar which they have ever since retained. It was not till 1810, when Radama I., king of the Hovas, extended his influence over the greater part of Madagascar, that Madagascar became important to the commercial countries of Europe. The English entered into a treaty with him in 1816, and in consideration of his promise of assistance to suppress the slave-trade with Mozambique, English drill-sergeants were sent to him to discipline the native troops. Missionaries had previously established themselves, and by their aid a few English mechanics found the means of introducing useful arts among the inhabitants. With the ostensible object of carrying out his agreement, Radama was furnished with fire-arms for his troops, which he quickly, however, made use of in the reduction of such tribes as yet remained in opposition to his supremacy. Upon the death of Radama, in 1828, he was succeeded by Ranavalo I., a woman whose reign was marked by every cruelty possible to be practiced against the native Christians. She closed the missionary schools, and banished Europeans from the island. In consequence of the outrages to which her orders gave rise in 1845, English and French troops made an attack on Tamatave, the usual trading port on the east coast, but without any satisfactory result. In 1862 the queen died, and her son was proclaimed king under the title of Radama II. He concluded a treaty granting concessions of territory to M. Lambert, a French merchant acting in the name of France. A conspiracy was formed against the king, and he was strangled in 1863. His wife, Rosaherina, then ascended the throne. The change was favorable to English as opposed to French interests in the island. In 1865 treaties were concluded with England and America, while that which M. Lambert had negotiated was declared null. On the death of Rosaherina, disputes again broke out as to a successor, between the native or Hova and the European parties. With the aid of the prime minister, Rainitaiarivoy, a female relation of the late queen, was raised to the throne, under the name of Ranavalo II. She showed great favor to the Protestant missionaries, had herself instructed in the Christian religion, and on Feb. 21, 1869, she, the prime minister, whom she had married, and a large number of the nobility, were baptized. Towards the close of the year, a body of mounted officers, by order of the government, set fire to the Kalimalaza, the chief idol, and the temple in which it stood. The destruction of other idols followed. The effect was most favorable to the Protestant missionaries.—See *History of Madagascar* (Lond. 1838); *Three Visits to Madagascar* (Lond. 1858); and *Madagascar Revisited*, 1867, by the rev. W. Ellis; *Voyage à Madagascar*, by Ida Pfeiffer (Paris, 1862); *Histoire physique naturelle, et politique de Madagascar*, by Grandidier (vol. i. Par. 1876); *L'Ile de Madagascar*, by E. Blanchard; and *Twelve Months in Madagascar*, by Joseph Mullens, D.D. (1875).

MADAME (plural, *Mesdames*), the French word or title of respect and honor formerly applied exclusively to ladies of high rank, but now employed in addressing all married ladies. It is derived from the two French words *ma*, my, and *dame*, lady. In nearly every country in Europe and in the United States, it has come into use to distinguish married from unmarried ladies; and it is certainly a better word than the old English title of mistress, which we abbreviate to Mrs. and mispronounce missis. The French consider it a mark of respect to address ladies whose condition, whether married or unmarried, is not known, by the title of madame. Though the regular plural is *mesdames*, there are many phrases in French which permit the use of *madames* and *madame* in the plural: as "The Mrs. Smiths were numerous there," would be translated—*Les madame Smith y étaient nombreuses.* "There are many ladies without a gentleman," would be expressed by—*Il ya bien de madames sans messieur.* The word lady alone would be expressed in French simply by *dame*, and not *madame*, except when personally addressed, either orally or in writing, when the prefix *ma* is invariably added

MAD-APPLE, a name sometimes given to the apple of Sodom (*solanum Sodomeum*), sometimes to the fruit of the egg-plant (q.v.), and sometimes to the large galls (q.v.) known as *Mecca* or *Bussorah galls*, and which are also called apples of Sodom.

MADAR'. See MUDAR, *ante*.

MADAWAS'KA, a co. in n.w. New Brunswick; 1500 sq.m.; traversed by branches of the St. John, which separates it from Maine on the s.w.; was formerly part of Victoria co. The surface is hilly but fertile.

MADDALO'NI, a city of southern Italy, in the province of Caserta, 14 m. n.n.e. of Naples. Pop. 17,798. It stands in a finely irrigated and fertile district, and enjoys a most salubrious climate. It is an industrious and thriving place, with several fine palaces and churches. It is now connected by railway with Naples and Gaeta.

MADDEN, Sir FREDERICK, 1801–73; b. Portsmouth, Eng.; entered the service of the British museum in 1826 as a cataloguer; two years later was made assistant-keeper of the department of manuscripts, and in 1837 became keeper of the department. He was made a knight of the Hanoverian order by king William IV. in 1832, and in 1834 was gazetted one of the gentlemen of the privy chamber. He continued to hold his post in the British museum until 1866, when he retired; the remainder of his life was devoted to antiquarian and literary study. He edited for the Roxburghe club the metrical romance of *Havelok the Dane;* he also edited *Layamon's Brut, or Chronicle of Britain; Illuminated Ornaments Selected from MSS. and Early Printed Books from the 6th to the 7th centuries;* and other works.

MADDEN, RICHARD ROBERT, b. Dublin, 1798; studied medicine, and was a fellow of the royal college of surgeons. His life has been passed in various official positions in the civil service, the latter part of it as secretary to the loan fund board in Dublin castle. He is best known as a fertile and versatile writer of biography, fiction, travels, history, etc. His principal works are *The Infirmities of Genius; Shrines and Sepulchres of the Old and New World; The Life and Martyrdom of Savonarola; The Turkish Empire in its Relations with Christianity and Civilization;* and *The United Irishmen of* 1798.

MADDER, *Rubia,* a genus of plants of the natural order *rubiaceæ,* very nearly allied to the genus *galium* or bed-straw (q.v.), and differing from it chiefly in having a juicy fruit resembling two small berries growing together. The species are found in the tropical and warmer temperate parts, both of the old and new worlds, and are important for the coloring matter of their roots. The most important is the COMMON MADDER or DYER'S MADDER (*R. tinctorum*), a native, probably, of the s. of Europe as well as of Asia; and now very extensively cultivated in most European countries, and also in the East Indies, China, etc. It is a perennial, with weak stems and whorls of 4–6 elliptic or lanceolate glossy leaves, the stem and leaves rough with sharp prickles; small greenish-yellow flowers, and black fruit. Munjeet (q.v.), or INDIAN MADDER (*R. munjista* or *cordifolia*), ranks next to it in importance. The roots of *R. peregrina* and *R. lucida* are also used in some parts of the Levant. *R. peregrina* is found in the s.w. of England, and is called WILD MADDER. It is very similar to *R. tinctorum.* The roots of *R. relbun* and *R. Chilensis* are used in Chili and Peru.

There is no material of greater importance to dyers than madder (*R. tinctorum*), not only from the great beauty of the colors obtainable from it, but also from the ease with which it can be worked, and the great variety of its applications. Although the madder plant thrives best in warm climates, it may be, and is successfully cultivated in northern districts. The Dutch province of Zeeland has long been celebrated for the large crops of madder produced there; and until about 40 years since, our dyers rarely used any other than Dutch madder, which was always sent ground and packed in large casks; but with the improvements in dyeing, it was discovered that the roots grown in warmer localities possessed not only much superior qualities, but could be made to produce other and more beautiful shades of color. Besides a genial temperature, madder requires a rich, deep soil and careful cultivation. It is usually propagated by cuttings or by shoots from the stocks of old plants; these are set about a foot apart, and in rows, 3 ft. from each other; the planting takes place in spring; and sometimes the roots are lifted at the usual harvest-time for madder (Oct. or Nov.). In France and Germany the markets are supplied with one-year-old (called by the Germans *röthe*), 18 months old, and three years old, which is the best, and called by the Germans *krapp,* or madder *par excellence.* The roots are carefully raised with forks, to prevent breaking them as much as possible; and after the soil is thoroughly shaken off, they are dried in stoves, and afterwards thrashed with a flail to remove the loose skins and any remaining soil still adhering; they are then cut, or broken in pieces, and packed for sale, or they are sent to the mills to be ground. In Turkey and Italy, where the solar heat is great, the stove is dispensed with, the roots being dried in the sun. The more the roots are freed from the epidermis, the better the quality of the madder; hence, before it is ground in France, many manufacturers employ mechanical means, chiefly sieves worked by machinery, which rub off and separate the soft, dark-brown skin which covers the roots; this process is called *robage.* One-year-old roots cannot be profitably dressed in this way, and are therefore ground with the epidermis. Much of the inferior Dutch madder is also ground without dressing, and such is called *mull* in trade. The grinding is effected in mills with vertical stones, and the meal is passed through sieves of different degrees of fineness, which gives rise to various qualities in the market. These qualities are numerous, and have special marks to distinguish them, well known to merchants, but are of no general interest. The madder from Turkey and from India never comes to us ground; the roots are merely broken up into pieces an inch or two in length, and packed in bales. Very small quantities of madder occasionally reach us from Russia; it is the produce of the government of Baku, on the Caspian sea, and is said by our dyers to be the finest in the world.

As might be expected of a substance of such vast commercial and manufacturing value, madder has undergone the most elaborate chemical researches. Its dyeing quality has been known for at least 2,000 years, and its medicinal qualities are also mentioned by Pliny and Dioscorides. The former writer, referring to its value as a dyeing

material, says: "It is a plant little known except to the sordid and avaricious, and this because of the large profits obtained from it, owing to its employment in dyeing wool and leather. The madder of Ravenna was, according to Dioscorides, the most esteemed. Its cultivation in Italy has never been discontinued; and under the present enlightened government it has received such an impetus that the exports of the Neapolitan provinces alone, in one year, exceeded in value a quarter of a million sterling. It was about the beginning of the present century that the coloring matter of madder began to attract very especial attention. It had long before been noticed that cattle which used the green parts of the plant as fodder had a red color communicated to their bones, which was only removed by discontinuing this kind of food for a considerable time. This showed the coloring matter to be capable of isolation; dyers also began to suspect that the color produced was a combination of two—one red, and the other a purplish brown. But Roubiquet, a French chemist, about 1820, demonstrated that madder contains two distinct colors, capable of being isolated and used separately; he called them alizarine and purpurine; the former, he asserted, gave the bright red, and the latter the purple red colors. Practically, Roubiquet's statement may be held to be correct; but the recent and more elaborate researches of Dr. Schunck, of Manchester, have shown the composition of madder to be very complicated indeed. At the meeting of the British association in 1861 he showed the following chemical principles, all obtained from this remarkable root: 1. Rubianine; 2. Rubianic acid; 3. Rubianite of potash; 4. Purpurine; 5. Chlorrubian; 6. Pthalic acid; 7. Alizarine; 8. Rubiadine; 9. Chlorrubiadine; 10. Rubiafine; 11. Rubiacine; 12. Rubian; 13. Verantine; 14. Perchlorrubian; 15. Rubiagine; 16. Grape-sugar; and 17. Succine. Within the last three years, artificial alizarine has been produced, and is now extensively used by dyers. It is one of the numerous series of aniline colors.

Dyers employ madder for giving the celebrated Turkey-red to cotton goods, and for this purpose employ means for developing the alizarine; and for purples, lilacs, and pinks, which are obtained by means of the purpurine. Manchester, Glasgow, Paisley, Alexandria, and other places on the banks of the Clyde, are the chief seats of this industry; the imports of madder into Britain in 1875 amounted to 126,152 cwt., amounting in value to the sum of £410,993.

MADDER-LAKE, a painter's color, made from madder, by boiling it in a solution of alum, then filtering the liquid, and adding sufficient carbonate of soda to cause precipitation of the alizarine or red coloring matter of the madder, which alone has been dissolved by the boiling solution of alum. This lake is used either as an oil or water color.

MADEI'RA, an island in the n. Atlantic ocean, off the n.w. coast of Africa, from the nearest point of which it is 390 m. distant, in lat. 32° 43′ n., long. 17° west. It lies 280 m. n. of Teneriffe, in the Canaries, and 620 m. s.w. of Lisbon. Madeira and the other islands of the group form a province of Portugal, with an area of 345 sq.m., and pop. '72, 115,000—including the adjoining small island of Porto Santo—of whom 186 are English resident. It has been compared, in appearance, to the island of Arran, in the Firth of Clyde, but is wilder and grander. Its coasts are steep and precipitous, rising from 200 to 2,000 ft. above sea-level, comprising few bays or landing-places, and deeply cut at intervals by narrow gorges, which give to the circumference the appearance of having been *crimped*. From the shore, the land rises gradually to its highest point, the Pico Ruivo, 6,050 ft.; there are several other peaks upwards of 4,000 ft. high. It is remarkable for its deep valleys, the most noted being that of "Curral," which from brink to bottom has a depth of 2,060 feet. Madeira is of volcanic origin, and slight earthquakes sometimes, though rarely, occur. The lower portions of the island abound in tropical plants, as the date-palm, banana, custard-apple, mango, sweet-potato, Indian corn, coffee, sugar-cane, pomegranate, and fig. The fruits and grains of Europe are cultivated to an elevation of 2,600 ft. above the sea-level, and the vine and sugar-cane on the lower grounds; above these are found timber (including the chestnut, whose fruit is used extensively by the inhabitants as food), pine (*pinus maritima*) used as fuel, fern, grass, and heath, and the scant herbage of alpine regions. Madeira produces 80 or 90 plants peculiar to itself, but the flora in its general characteristics resembles that of the countries around the Mediterranean sea. The grape disease has, within recent years, been almost universal, and wine has not been made in such quantity as formerly. Madeira has no indigenous mammalia, but the ordinary domestic animals, together with rabbits, rats, and mice, have been introduced by the Portuguese. The climate is remarkable for its constancy. There are only 10° difference between the temperatures of summer and winter, the thermometer in Funchal (the capital of the island) showing an average of 74° in summer, and of 64° in winter. At the coldest season, the temperature rarely is less than 60°, while in summer it seldom rises above 78°; but sometimes a waft of the *lesté*, or e. wind, rises it to 90°. The temperate and constant warmth of its climate has made it a favorite resort for invalids affected by pulmonary disease. Besides the English church, there are other places of worship, including a Presbyterian church in connection with the Free church of Scotland. The educational institutions comprise the Portuguese college and Lancasterian and government schools. Funchal (q.v.) is the port of the island. In 1877, 619 vessels, chiefly British, of 437,823 tons,

entered and cleared the port. The imports in 1877, consisting chiefly of cotton, woolen, and linen manufactured goods, iron, flour, earthenware, Indian corn, rice, oil, and timber, amounted to £276,327; the exports for the same year, consisting of wine, sugar, citron, embroidery, and wicker-work, coal, salt-beef, and hides, amounted to £232,656. The vintage of 1877 was scanty, only yielding about 6,000 pipes of wine. The sugar-cane crop yielded about 667 tons of sugar, and 240,000 gallons of spirits. The trade is chiefly with Great Britain.

The inhabitants of Madeira are of mixed Portuguese, Moorish, and negro descent; they are of vigorous frame, lively and industrious, but totally uneducated. Madeira was formerly covered with forests, whence its name—the Portuguese word *madeira* signifying timber. The group to which this island belongs, sometimes called the northern Canaries, was discovered in 1416, and was shortly afterwards colonized by the Portuguese. (Compare White's *Madeira, its Climate and Scenery*.)

MADEIRA, or MADERA, or CAYARA, an important river of Brazil, South America, and an affluent of the Amazon, has its origin in the confluence of several rivers, the chief of which are the Beni, Mamore, Madalena, and Stanez, in lat. about 10° south. It has a n.e. course of 700 m., for the last 500 m. of which it is navigable, the remaining 200 being obstructed by numerous cataracts; and it falls into the Amazon in lat. 3° 25′ s., long. 59° 45′ west. Including the Mamore, the entire length is about 1500 miles.

MADEIRA NUT, the fruit of the *Juglans regia*, a large timber tree. It is an edible nut, popularly known as the English walnut. A drying oil, of much value in the manufacture of varnishes, is made from its kernel.

MADEIRA WINE is produced on the Portuguese island of Madeira in the Atlantic ocean. The introduction of vines dates from 1421, and wine was until within recent years exported in large quantities. The valley of the Cama de Lobos became known for its excellent Malmsey wine, besides which the dry Maderia, the sercial, and the *tinto* were much sought after. The grapes are almost all white, and ripen in the shade of trellises, where they are allowed to become half dry before being gathered. It is said that they all come from stocks which were brought from Candia in 1445. The principal wine growers are Englishmen, as Madeira wine has always been consumed in large quantities in England. There is an enormous proportion of wine, manufactured in Europe, sold as genuine Madeira, which, together with the destruction of the vines by the *oidium*, reduced the production from 22,000 pipes in 1813 to 3,000 in 1844; in consequence of which many of the inhabitants have emigrated to the West Indies and Guiana. From 1847 to 1855 the vintages decreased as follows: 1847-50, 16,000 pipes; 1851, 12,000; 1852, 1000; 1853, 754; 1854, 187; 1855, 29. In 1857, however, the sulphur remedy was tried with great success, and a decided improvement was noticed in the wine production of 1861. At the present time there are favorable signs that the vintage of Madeira may, with judicious cultivation, reach its former prosperity.

MADHAVA is an apellation of the Hindu god Vishnu (q.v.), one by which he is very frequently designated in Hindu mythology and in Sanskrit poetry.

MÂDHAVÂCHÂRYA (i.e., *Mâdhava*, the Achârya, or spiritual teacher) is one of the greatest Hindu scholars and divines that graced the mediæval literature of India. He is famed for his numerous and important works relating to the Vedic, philosophical, legal, and grammatical writings of the ancient Hindus, and also for his political connection with the history of some renowned kings of the Deccan. His learning and wisdom were so eminent, that he was supposed to have received them from the goddess Bhuvaneswarî, the consort of Siva, who, gratified by his incessant devotions, became manifest to him in a human shape, conferred on him the gift of extraordinary knowledge, and changed his name to Vidyâranya (the forest of learning), a title by which he is sometimes designated in Hindu writings. All the traditions about Mâdhavâchârya, however differing from one another, agree in ascribing the origin of Vijayanagara to Mâdhava. His birthplace is said to have been Pampa, a village situated on the bank of the river Tungabhadrâ; and as all the accounts of his life admit his having been the prime minister of Sangama, the son of Kampa, whose reign at Vijayanagara commenced about 1336, and to have filled the same post under king Bukka I., who succeeded Harihara I. about 1361, and as he died at the age of ninety, the date of his birth coincides probably with the beginning of the 14th century. Among his works, the principal are his great commentaries on the Rig-, Yajur-, and Sâma-veda (see VEDA); an exposition of the Mîmânsâ philosophy; a summary account of fifteen religious and philosophical systems of Indian speculation; some treatises on the Vedânta philosophy; another on salvation; a history of Sankara's (q.v.) polemics against multifarious misbelievers and heretics; a commentary on Parâs'ara's code of law; a work on determining time, especially in reference to the observation of religious acts; and a grammatical commentary on Sanskrit radicals and their derivatives. The chief performance of Mâdhava is doubtless the series of his great commentaries on the Vedas, for without them no conscientious scholar could attempt to penetrate the sense of those ancient Hindu works. In these commentaries, Mâdhava labors to account for the grammatical properties of Vedic words and forms, records their traditional sense, and explains the drift of the Vedic hymns, legends, and rites. That in an undertaking almost unparalleled, in the literary history of any nation,

for its magnitude and difficulty, Mâdhava should have committed sundry inaccuracies —the remedy against which, however, is really always afforded by himself—can surprise no one; but when modern Sanskrit philology affords the spectacle of writers haughtily exaggerating these shortcomings, and combining with their would-be criticisms the pretense of establishing the true sense of the Vedas without the assistance of Mâdhava, a mere comparison of the commentary of the latter with what the European public is called upon to accept as its substitute, adds a new testimony to the vast superiority of the Hindu scholar over his European antagonists. See VEDA. Some of Mâdhava's works seem to have been lost.

MADHU'CA. See BASSIA.

MA'DIA, *Madia,* a genus of plants of the natural order *compositæ,* sub order *corymbiferæ,* having seeds without pappus, the outer ones situated between the leaves of the involucre, the flowers yellow, the exterior ones rather shortly ligulate, those of the disk tubular. The plants of this genus are annual, of upright habit, rough with glandular hairs, and very viscid; they are important on account of the utility of the seeds as a source of vegetable oil. *M. sativa,* a native of Chili, is there called *madi* or *melosa,* and is generally cultivated as an oil plant. It is 3 to 5 ft. high, has ovato-lanceolate, entire leaves; the flowers terminal, and crowded upon the leafy branches. It has been known in Europe since the beginning of the 19th c., but first began to be cultivated in fields as an oil-plant in 1839. The results of experiments in its cultivation have not, however, in most cases been so favorable as was expected; yet it deserves attention, as it is only annual, does not suffer from frost, does not demand a very good soil, and produces an excellent oil. Madia oil is richer than poppy oil, almost entirely inodorous, of a bland, agreeable taste, and very suitable for oiling machines, as it does not freeze even at a cold of 10° F. The oil-cake is a good food for cattle. The straw and chaff have poisonous properties. It is, however, a great disadvantage that the flowers ripen gradually in succession, so that the first are already fallen off when the last are not yet ripe. The cultivation of *M. sativa* has not yet been attempted on a considerable scale in Britain. —Another species, *M. elegans,* is cultivated in flower-gardens.

MADISON, a co. in n. Alabama, having the state line of Tennessee for its n. boundary, and the Tennessee river for its s., is drained by the Flint river, emptying into the Tennessee; 800 sq.m.; pop. '80, 37,625—37,433 of American birth, 19,033 colored. Its surface is undulating, rising in the n. into high hills, and in the s. stretching into wide fertile prairies. It has a large proportion of tillable land, as well as extensive forests. Its soil, with a limestone foundation, is fertile, and produces live stock, every kind of grain, tobacco, cotton, wool, sorghum, and sweet-potatoes. In '70, it produced 6,334 lbs. of honey. Cash value of farms in '70, $2,194,834, numbering 2,758. It had in '70, 93 manufacturing establishments, including foundries, manufactories of sashes and blinds, carriages and wagons, cotton goods, flour and saw mills, employing 449 hands, with a capital of $167,440, and an annual product of $501,096. It is intersected by the Memphis and Charleston railroad. Seat of justice, Huntsville.

MADISON, a co. in n.w. Arkansas, having a range of the Ozark mountains for its s. boundary, is drained by the War Eagle, King's river, and the Main Fork, all branches of the White river; 750 sq.m.; pop. '80, 11,455—11,439 of American birth, 124 colored. Its surface is mountainous. Groves of oak, chestnut, pine, and fir grow on the hill sides, in which are found deposits of iron ore, marble, and limestone. The products of its soil are adapted to the raising of live stock; oats, corn, rye, wheat, tobacco, wool, sweet-potatoes, honey, sorghum, and flax are cultivated. Seat of justice, Huntsville.

MADISON, a co. in n. Florida, having the state line of Georgia for its n. boundary, lake Micosuki for its extreme n.w., and the Withlacoochie river, a branch of the Suwanee, for its e. border; 750 sq.m.; pop. '80, 14,798—14,773 of American birth, 9,190 colored. It is also drained by the Ocilla river, forming its s.w. boundary and emptying into Appalachee bay. Its surface is uneven and broken, and largely covered with forests of good building timber, which is an article of export. Its soil, near the water courses, is fertile and suited to the production of live stock, oats, corn, cotton, wool, sweet-potatoes, and sugar-cane. It had in '70, 16 manufacturing establishments, mostly lumber and grist mills, and machine shops, employing 96 hands, with a capital of $75,900, and an annual product of $102,825. It is intersected centrally by the Jacksonville, Pensacola and Mobile railroad. Seat of justice, Madison.

MADISON, a co. in n.e. Georgia, having branches of the Broad river of Georgia for its s. and e. boundary; 400 sq.m.; pop. '80, 7,978—7,973 of American birth, 2,586 colored. Its surface is hilly and two-thirds covered with a dense growth of timber. Granite, gold, and iron are its mineral products. In some localities there are mineral springs of great medicinal value; and its soil, partly fertile, is adapted to the raising of cattle, sheep and swine, oats, corn, wheat, cotton, wool, and sweet-potatoes. Seat of justice, Danielsville.

MADISON, a co. in s.w. Illinois, having the Mississippi river for its w. boundary, separating it from Missouri; the Missouri river emptying into the Mississippi in its vicinity; 750 sq.m.; pop. '80, 50,141—38,518 of American birth. It is drained by

Cahokia creek, and numerous small creeks and rivulets. Its surface is generally level, with well wooded elevations in the w. part, on which elm, walnut, linden, and maple trees are found, as well as oak, hickory, and ash. Its soil is fertile, and rests on strata of carboniferous limestone and bituminous coal, which appears in largest quantities at Alton. Coal, lime, and building stone are exported. It is traversed by the Indianapolis and St. Louis railroad, and the St. Louis, Vandalia and Terre Haute. The Jackson division of the Chicago and Alton railroad forms a junction with the main line in the n.w. section, and its county seat is the s.w. terminus of the Chicago and Alton railroad on the Indianapolis and St. Louis, and the St. Louis, Rock Island and Chicago railroad. It produces every variety of grain, tobacco, wool, sweet-potatoes, sorghum, and the products of the dairy. Its manufacturing product in '70 was $4,794,490. There are flour and lumber mills, carriage factories, plow factories, bell factories, cigar factories, breweries, foundries, woolen-mills, distilleries, manufactories of church organs, and brick-yards. Lime is manufactured; also cement, agricultural implements, plug tobacco, tin, copper, and sheet-iron ware. It had in '70, 15 coal mines. Seat of justice, Edwardsville.

MADISON, a co. in e. Indiana, drained by Fall creek, Pipe creek, and the head waters of the East and West Forks of White river; 475 sq.m.; pop. '80, 27,531—26,877 of American birth. It is traversed by the Cleveland, Columbus, Cincinnati and Indianapolis railroad; the Columbus, Chicago and Indiana Central; the Lafayette, Muncie and Bloomington; the Pittsburg, Cincinnati and St. Louis; and the Cincinnati, Wabash and Michigan, with junctions at Alexandria, Elwood, and Anderson. Its county seat is the terminus of the Anderson, Lebanon and St. Louis railroad. Its surface is generally level, and partially covered with a dense growth of building timber. Its soil is calcareous and very fertile, producing buckwheat, barley, oats, rye, wheat, tobacco, wool, wine, fruit, sorghum, and maple sugar. It produced in '70, 1,028,150 bushels of corn, and 12,110 lbs. of honey. Its extensive water power is utilized by flour, lumber mills, etc., and among its manufactures are carriages, staves and headings, chairs, engines, furniture, sashes and blinds, agricultural implements, saddlery and harness, and woolen goods. It had in '70, 127 manufacturing establishments, employing 446 hands, with a capital of $377,807, and an annual product of $829,250. Cash value of farms in '70, $9,399,441, numbering 2,288. Value of live stock in '70, $1,229,996. Limestone is quarried. Seat of justice, Anderson.

MADISON, a co. in central Iowa, drained by Middle river, and other branches of the river Des Moines, and by the head waters of the Grand river; 576 sq.m.; pop. '80, 17,225—16,460 of American birth, 11 colored. Its surface is rolling, with a large proportion of fertile prairie, much tillable bottom land, and excellent grazing country, containing beds of bituminous coal. Its products are fruit, and all kinds of grain, tobacco, wool, dairy products, hops, flax, maple sugar, sorghum, and honey. Among its manufactories are woolen-mills, grist-mills, and plow factories. The Chicago, Rock Island and Pacific railroad forms a portion of its n.w. boundary, and the Indianola and Winterset branch of that road terminates at its county seat. Seat of justice, Winterset.

MADISON, a co. in e. Kentucky, having the Kentucky river for its n. boundary; drained by Silver creek and other streams; 450 sq.m.; pop. '80, 22,051—21,936 of American birth, 7,290 colored. Its surface is uneven and thinly timbered. Its calcareous soil is suited to the raising of cattle, sheep, and swine, every kind of grain, tobacco, wool, sweet-potatoes, sorghum, and maple sugar. It produced in '70, 5,835 galls. of wine, and 4,715 lbs. of honey. Cash value of farms in '70, $8,981,032, numbering 1,592. Value of live stock in '70, $1,948,277. It had in '70, 103 manufacturing establishments, employing 302 hands, with a capital of $286,375, and an annual product of $707,169; consisting of flour and saw mills, woolen-mills, manufactories of stone ware, of carriages and wagons, of saddlery and harness, plow factories, and distilleries. Seat of justice, Richmond.

MADISON, a parish in n.e. Louisiana, having the Mississippi river for its e. boundary separating it from the state of Mississippi, and the navigable Tensas river, a confluent of the latter, for its w. boundary; also drained by the Macon bayou; 600 sq.m.; pop. '80, 13,908—13,754 of American birth, 12,657 colored. Its surface is mostly level and low, with large forests of cypress and the kinds of trees generally found in the gulf states. The alluvial soil along the water courses is very fertile, and produces corn, cotton, and sweet-potatoes. Cash value of farms in '70, $1,757,403, numbering 1,543. Value of live stock in '70, $355,598. It is intersected centrally by the Vicksburg, Shreveport and Texas railroad. Seat of justice, Delta.

MADISON, a co. in central Mississippi, having the Big Black river for its s.w., w., and n.w. boundary, and the Pearl river for its e., s.e., and n.e. boundary; intersected centrally by the Chicago, St. Louis and New Orleans railroad; 650 sq.m.; pop. '80, 25,866—25,672 of American birth. Its surface is composed of fertile prairies extending on all sides into rich plains, dotted here and there with groves of timber, growing on the fine bottom land of the river banks. Its county seat is a thriving cotton mart. Its soil is adapted to the raising of cattle and sheep, and produces, tobacco, cotton, wool, sweet-potatoes, the products of the dairy, oats, corn, and wheat. It produced in '70, 5,786

lbs. of honey. Cash value of farms in '70, $2,907,357, numbering 704. Value of live stock in '70, $840,606. Seat of justice, Canton.

MADISON, a co. in s.e. Missouri, drained by Castor creek and the head waters of the St. Francis river; intersected in the n.e. portion by the St. Louis, Iron Mountain and Southern railroad; 440 sq.m.; pop. '80, 8,860—8,506 of American birth, 308 colored. Its surface is hilly and well timbered, with a foundation of limestone, and containing beds of iron and lead ore, nickel, copper, gold, platinum, and silver. Its soil is adapted to the production of live stock, fruit, every variety of grain, tobacco, wool, sweet-potatoes, dairy products, honey, maple sugar, and sorghum. It had in '70 an annual manufacturing product of $77,785. It has steam flouring mills, breweries, lumber mills, railroad repair-shops, and smelting furnaces. Its lead mines in the extreme n.e. section have been worked for more than 100 years, and in the vicinity cobalt, malachite, and other minerals are found. Seat of justice, Fredericktown.

MADISON, a co. in s.w. Montana, having a range of the Rocky mountains for its s. boundary separating it from Idaho; drained in the e. portion by the Madison river running n., in the w. by the Beaver Head, Wisdom, and Passamari creeks which unite to form the Jefferson fork of the Missouri; about 5,100 sq.m.; pop. '80, 3,916—2,890 of American birth, 294 colored. It is a fine agricultural and rich mining district, and an excellent grazing country. The mountains, deep divides, and cañons present scenery of great beauty and grandeur. It is in close proximity to the national park and the valley of the Yellowstone river. Groves of evergreen trees grow on the foot-hills and along the river bottoms. The agricultural products of its valleys are barley, oats, rye, wheat, and live stock. Its principal industries are hydraulic, placer, and quartz mining; and in '70, it had 15 hydraulic gold mines, 10 placer mines, and 8 quartz mines. Whole number of hands employed 219, aggregate capital $672,800, with an annual product of $216,416. Valuable silver mines are found near the Madison river, and are still attracting prospecting parties. Granite and silurian limestone underlie this region, and basalt, feldspar, gneiss, galena, and serpentine are found; also, in the vicinity of the county seat, hot springs with valuable medicinal properties. In the extreme s.e. is Sawtelle's peak, an extinct volcano composed of porphyry, basalt, etc. With the exception of the Utah Northern railroad, extending some distance n. of Red Rock in the s. portion, the transportation is by wagon and coach over roads along the mountain side built at great expense; and the vast amount of freight following the progress of the railroad proves the rapid settlement of the country. Seat of justice, Virginia City.

MADISON, a co. in w. North Carolina, having the Iron or Great Smoky mountains for its n. boundary separating it from Tennessee, is watered by the French Broad river; 450 sq.m.; pop. '80, 12,810—12,798 of American birth, 457 colored. Its surface is hilly and principally covered with a thick growth of timber. It contains mineral deposits of great value. Its soil is adapted to the raising of live stock, tobacco, buckwheat, oats, corn, rye, wheat, wool, sugar-cane, flax, sweet potatoes, and the products of the dairy. It produced in '70, 20,209 lbs. of honey. Its scenery presents many attractive features, notably where the French Broad river flows through a gorge of the Smoky mountains, near the celebrated Warm springs of North Carolina, and the slopes of Bald mountain rise in the extreme n.e., 5,552 ft. above the level of the sea. Seat of justice, Marshall.

MADISON, a co. in n.e. Nebraska, drained by the Elkhorn river and its north branch in the n. section, and by Taylor creek in the s.; 576 sq.m.; pop. '80, 5,589—4,136 of American birth, 6 colored. Its surface is rolling and thinly timbered. Its soil is adapted to stock raising and the production of grain, wool, dairy products, and sorghum. Its water-power is utilized to some extent, and it has a U. S. land agency. Seat of justice, Madison.

MADISON, a co. in s.w. Ohio, drained by Paint creek, Deer creek, Darby creek, and other tributaries of the Scioto river; 440 sq.m.; pop. '80, 20,129—18,841 of American birth, 1078 colored. Its surface is generally level and thinly timbered. Its soil is suited to the raising of tobacco, wool, wine, dairy products, fruit, sorghum, flax, hops, and all kinds of grain. It produced in '70, 11,683 lbs. of honey. Cash value of farms in '70, $10,713,942, numbering 1263. Value of live stock in '70, $1,644,404. It is traversed by the Cincinnati, Sandusky and Cleveland, the Pittsburg, Cincinnati and St. Louis railroads, the Little Miami railroad, and the Springfield Southern. Flour and carriages and wagons are manufactured. It had in '70, 117 establishments, employing 328 hands, with a capital of $175,316 and an annual product of $405,806. Seat of justice, London.

MADISON, a co. in central New York, having Oneida lake, 20 m. long and 6 m. wide, for its n. boundary; drained by Oneida creek, the Chenango river, the Unadilla river on its s.e. border, the Chittenango river on the s.w., and the Canastota emptying into Oneida lake; also by Cazenovia lake, 3 m. long, in the w. section; 650 sq.m.; pop. '80, 44,372. Its surface is low and uneven, well wooded, in some portions swampy, in others sinking into deep, narrow valleys. Sugar-maple, ash, and oak trees grow in profusion. Its soil has an underlying formation of Niagara limestone and Onondaga limestone, and stone which is quarried for building purposes. Gypsum and water-lime are found, and saline sulphur springs. Hops are exported, the yield in '70 being

3,232,925 lbs. Its productions include every variety of grain, tobacco, maple-sugar, wool, Irish potatoes, and an enormous dairy product. It produced in '70, 8,389 lbs. of honey. Cash value of farms in '70, $26,568,018, numbering 4,140. It had in '70, 736 manufacturing establishments, employing 2,488 hands, with a capital of $2,149,286, and an annual product of $4,798,371. Its leading industries are the manufacture of carriages, wagons, flour, brick, cheese, leather, agricultural implements, lumber, cooperage, steam engines, optical and astronomical instruments, pocket cutlery, boxes, furniture, water-lime, lime, cotton, silk, and woolen goods, ship-building and repairing. It has distilleries, foundries, and knitting-mills. It is intersected by the New York Central and Hudson River railroad and the Utica, Clinton and Binghamton, with their branches, the Cazenovia, Canastota and De Ruyter railroad; the Erie canal and the Chenango canal, connecting Utica with Binghamton, following the course of the Chenango river in the s.e. section. Seat of justice, Morrisville.

MADISON, a co. in w. Tennessee, intersected centrally by the Chicago, St. Louis and New Orleans, and the Mobile and Ohio railroads, forming a junction at Jackson; watered by the Middle fork of Forked Deer river, forming its n. boundary; 600 sq.m.; pop. '80, 30,874—30,632 of American birth, 15,465 colored. It is drained by the South fork, flowing diagonally through it, and its generally level surface is well wooded with groves of the tulip tree, beech, and ash, and forests of oak, hickory, and walnut. Its soil is fertile, producing oats, corn, rye, wheat, cotton, wool, sweet potatoes, dairy products, and honey. Cash value of farms in '70, $3,953,675, numbering 1547. Value of live stock, $956,719. Cotton is exported. Among its manufacturing establishments are tanneries, iron foundries, and railroad repair shops, flour and lumber mills, numbering in '70, 107, employing 392 hands, with a capital of $137,265, and an annual product of $370,022. Seat of justice, Jackson.

MADISON, a co. in s.e. Texas, having the Trinity river for its e. boundary, and the Navasota river for its w., is drained by numerous rivulets emptying into them; 550 sq.m.; pop. '80, 5,395—5,351 of American birth, 1703 colored. Its surface is undulating and well wooded with oak, pine, and other building timber. Its soil is fertile; products are live stock, corn, tobacco, cotton, wool, sweet potatoes, wine, honey, and sorghum. Seat of justice, Madisonville.

MADISON, a co. in n. Virginia, having the Blue Ridge mountains for its n.w. boundary, is bounded on the s., s.e., and s.w. by the Rapidan river, and drained by Oriskany creek and Robertson's and Hazel rivers; 280 sq.m.; pop. '80, 10,562—10,551 of American birth, 4,557 colored. Its surface is mountainous, and presents features of great natural beauty, attracting many tourists. A large proportion of the land is covered with forests of hard wood. Its soil is fertile in some sections, and produces live stock, hops, tobacco, wool, sweet potatoes, dairy products, honey, sorghum, oats, corn, rye, and wheat. Cash value of farms in '70, $1,753,087, numbering 489. It had it '70, 42 manufacturing establishments, employing 85 hands, with a capital of $35,950 and an annual product of $108,960; represented by cheese factories, tanneries, etc. Seat of justice, Madison Court-House.

MADISON, a city of Indiana, on the Ohio river, founded in 1808, lies 100 m. w.s.w. of Cincinnati. It is finely situated on an elevated, plateau, with a background of hills; has a court-house, 2 markets, 3 banks, 15 churches, cotton, woolen, and iron factories, several flouring-mills, large pork-packing establishments, and a flourishing trade. Pop. '70, 10,709.

MADISON (*ante*), a city in s.e. Indiana, the terminus of one branch of the Jeffersonville, Madison and Indianapolis railroad; pop. '70, 10,709. It is delightfully located 45 m. n. of Louisville, 86 m. s.e. of Indianapolis, and 45 m. s.e. of Columbus. The hills at the n. are 400 ft. high, overlooking the valley 3 m. in length. It is regularly and substantially built, lighted with gas, and abundantly supplied with water by an aqueduct. Its brick-yards furnish a large proportion of the building material. It has several public halls, a public library of 4,000 vols., excellent public schools, 2 national banks and a state bank, with an aggregate capital of $650,000. It supports 1 daily, 1 semi-weekly, and 2 weekly newspapers, and is accommodated by a daily line of steamers plying between its port and Cincinnati and Louisville. Its leading industries are represented by manufactories of engines and boilers, furniture, breweries, ship-yards, brass and iron foundries, and planing mills.

MADISON, the capital of Wisconsin, United States of America, founded in 1836, is beautifully situated on an isthmus between two lakes, 80 m. w. of lake Michigan, and the same distance e. of the Mississippi river. It contains the state capitol, university (founded in 1849), lunatic asylum, historical society, 4 banks, 2 daily, 1 tri-weekly, and 5 weekly papers, 2 of the latter being in the German language. It is the center of a fertile and salubrious country, and has a large trade. Pop. '70, 9,176.

MADISON (*ante*), a city, the capital of Wisconsin, the junction of the Chicago and North-western railroad, and the Watertown to Madison, and the Madison to Portage branches of the Chicago, Milwaukee and St. Paul railroad. It is the e. terminus of the railway to Prairie Du Chien, an important local shipping point; this railroad being the connecting-link between the Wisconsin and Iowa divisions of the Chicago and North-

western railway. Lying in the Four Lake country, the land on which it is built, between lake Mendota and lake Monona, 132 m. n.w. of Chicago, and 80 m. w. of Milwaukee, rises to an elevation of 788 ft. above the level of the sea, and 210 ft. above lake Michigan, and is about ¾ of a m. in breadth, and 3 m. in length; pop. '80, 10,325. Surrounding this plain are heights from which it is distinctly visible miles away. Lake Mendota on the n.w. border, with a depth of water estimated at 70 ft., is 9 m. in length and 6 m. in width, has a smooth, hard beach, and is navigated by excursion steamboats, from whose decks the most delightful views may be obtained. Lake Monona on the s.e., 5½ m. long and 2 m. wide, is connected by narrow straits with lakes Waubesa and Kegonsa, each about 3 m. long, and by straits farther s. flowing from these into the Fourth lake, forming a chain of beautiful lakes for a distance of 16 miles. The state-house is a stone edifice, with recent improvements costing $550,000, in height 200 ft., standing on a plateau 70 ft. above the water-level, surrounded by a beautiful park of 14 acres, shaded by forest trees left standing when the town was laid out, the foundation of the capitol being laid the following year. The county court-house and jail occupy the s. corner of the park. Westward from this point is College hill about 1 m. distant, 125 ft. above the lake, the site of the university of Wisconsin, open to both sexes. The city has 14 churches, a commercial college, a stereotype foundry, flour and woolen mills, wagon and carriage factories, manufactories of agricultural implements, reapers, mowing-machines, etc. It has a number of fine buildings for purposes of trade, and many elegant private residences in the suburbs. It is a popular summer resort, and its air is recommended as a palliative in diseases of the lungs. The state institution for medical treatment of the insane, 569 ft. in length, occupies an estate of 393 acres of forest, farm, and ornamental garden on the shores of lake Mendota, about 4 m. from the center of the city. The U. S. court-house and post-office here cost $400,000. It has excellent public schools, and several public libraries, among them the state library, of 7,500 vols.; that of the Wisconsin historical society, in a wing of the capitol, 58,000 vols., and a valuable collection of curiosities; those of the university of Wisconsin and its societies, 6,830 vols.; that belonging to the Madison institute, 3,500 vols.; and the state agricultural society library of 1000 volumes. About 1 m. from the capitol is the soldiers' orphans' home, on the shore of lake Monona.

MADISON, a village in n. Georgia, a shipping point for cotton, 104 m. w. of Augusta, 68 m. s.e. of Atlanta, and 175 m. w. of Savannah; pop. '70, 1389—770 colored. It is pleasantly situated on the Central railroad of Georgia, is the largest town between Atlanta and Augusta, and is rapidly increasing in population and business. It is the seat of justice of Morgan co., and has an active trade in cotton, the surrounding country being one of the most productive sections of the state. It is the seat of Georgia female college, established in 1850, an institution controlled by the Baptist denomination.

MADISON, a t. in Morris co., N. J., 17 m. w. of Newark, on the Morris and Essex division of the Delaware, Lackawanna and Western railroad. Its location is healthful and picturesque. It contains a classical institute, a Roman Catholic convent, 5 churches —the oldest of which is the Presbyterian, organized about the middle of the last century —and Drew theological seminary, established 1867, named after its founder, the late Daniel Drew of New York, and occupying what was formerly the Gibbon estate, containing about 100 acres, highly ornamented with walks and drives, shrubbery, and forest grove. The buildings are Mead hall—formerly the mansion-house of the estate—containing the chapel, reading-room, library, lecture rooms, and offices of the professors; Asbury hall, containing 72 rooms for students; Embury hall, containing a dining-room; Society hall, apartments for the matron, and 20 rooms for students; and 5 residences for the president and professors. The faculty are the president, who is also professor of historical theology, and 5 other professors. In addition to the systematic instruction thus furnished, special lectures on collateral topics are given by a large corps of representative men annually appointed. The number of students in 1880 was 104. The library contains 10,000 vols., carefully selected with special reference to the wants of students for the ministry; and in addition to these the libraries of the professors, amounting in the aggregate to about an equal number of volumes, are accessible to the students, under proper restrictions. The large endowment originally designed for the institution by the founder having been, in part, lost by his subsequent pecuniary misfortunes, successful efforts are in progress to make up the full amount by more general benefactions. The location of the seminary makes it the central theological school of the Methodist-Episcopal church, whose zeal, wisdom, and wealth may be relied on to secure for it the highest degree of permanent efficiency in the great work for which it has been established.

MADISON, JAMES, American statesman, and fourth president of the United States, was b. at King George, Va., Mar. 16, 1751. His father, James Madison, of Orange, was of English ancestry. He graduated at Princeton, N. J., in 1771, and studied law. In 1776 he was a member of the Virginia convention, and though too modest for an orator, his life from this time was devoted to politics, and he became one of the most eminent, accomplished, and respected of American statesmen. He was elected to the federal congress in 1779; in 1784 to the legislature of Virginia, in which he supported the measures of Mr. Jefferson in the revision of the laws, and placing all religious denominations

on an equality of freedom without state support. As a member of the convention of 1787, which framed the federal constitution, Mr. Madison acted with Jay and Hamilton, and with them wrote the *Federalist*. He did as much as any man, perhaps, to secure the adoption of the constitution, but opposed the financial policy of Hamilton, and became a leader of the republican or Jeffersonian party. He declined the mission to France, and the office of secretary of state, but in 1792 became the leader of the republican party in congress, and wrote the Kentucky resolutions of 1798, which contain the basis of the state-rights doctrines. Virginia, in the adoption of the constitution, declared her right to withdraw from the confederation, and at this early period established two state arsenals and made other preparations to resist the encroachments of a centralizing power. In 1801, Mr. Jefferson having been elected President, Mr. Madison was made secretary of state, which post he held during the eight years of his administration. In 1809 he was elected president. The European wars of that period, with their blockades and orders in council, were destructive of American commerce. The claim of the English government to impress seamen from American vessels was violently resisted. Mr. Madison vainly endeavored to avoid a war with England, which was declared in 1812, and continued for two years, at a cost of 30,000 lives and $100,000,000. He was one of the four presidents elected for a second term, during which he approved the establishment of a national bank as a financial necessity—a measure he had opposed and vetoed. In 1817 he retired to his seat at Montpelier, Va., where he continued to serve his country as a rector of the university of Virginia, and a promoter of agriculture and public improvements. Without being a brilliant man, he was a statesman of eminent ability and purity of character. He died at Montpelier, Jan. 28, 1836.

MADISON, JAMES (*ante*). The public life and works of James Madison fill a long period of American history, and are marked by a precocity of statesmanship, and calm, logical, judicial wisdom. At 21 years, a graduate of Princeton college, among a class of students who subsequently filled many of the highest judicial, political, and military offices, he appears from the beginning to have taken that intellectual leadership which he subsequently maintained. The exciting period of the opening of the revolution stimulated all young men of noble ambition to the study of the relationship of governors to the governed and of human rights in general; so that political discussions were on the fundamental laws of society in the broad fields of abstract justice, rather than in the ruts of partisan warfare and individual interests. The violence of arbitrary power which England exercised towards the colonies at this time, and the debates in the British parliament in which Chatham, Camden, Burke, and Fox assumed the defense of constitutional against arbitrary power, in opposition to lord North, Mansfield, and others, were calculated to place before the students of that day high ideals of political warfare. The vigorous pen of the masked Junius was a model of style for the more fiery patriots. That of Addison seems to have attracted young Madison, or, rather, his mind was by nature on the philosophic plane, so that it naturally expressed itself in a similar style. The following letter written from college to his father, July 23, 1770, indicates, however, that his mind was fired by the lack of patriotic resistance to British rule of which the merchants of New York had just given proof: "We have no public news," he writes, "but of the base conduct of the New York merchants in breaking through their spirited resolution not to import," etc. . . . "Their letter to the merchants of Philadelphia requesting their concurrence was lately burned by the students in the college yard, all of them appearing in their black gowns, and the bell tolling. There are about 115 in college and school, all of them in American cloth." On his return home from college he read law and miscellaneous literature, and at the same time taught his younger brothers and sisters. A lull took place in the controversy between the colonies and the mother country in consequence of the repeal of the stamp act and port duties, the tax on tea being the only one left; the repeal of which, said lord North, "is not to be thought of till America is prostrate at our feet." An extract of a letter written in 1772 to his college friend Bradford, afterwards attorney-general under the presidency of Washington, shows the grave maturity of his mind: "Pray do not suffer those impertinent fops that abound in every city to divert you from your business and philosophical amusements. You may please them more by admitting them to the pleasure of your company, but you will make them respect and admire you more by showing your indignation at their follies, and by keeping them at a distance. I am luckily out of the way of such troubles; but I learn you are surrounded with them, for they breed in towns and populous places as naturally as flies do in the shambles, because they get food enough for their vanity and impertinence." About this time Madison studied, exhausting the theological works of his time, and the Jewish and Christian Scriptures, and so erudite was he already considered that the founder of the university of Virginia called upon him to furnish a list of theological works for its library. When the question arose in Virginia, in 1774, whether the state church (the church of England) should be maintained, his breadth of view became manifest. The Episcopalians of Virginia and the Puritans of New England were quite ready to practice against others the same exclusion for religious opinions which had caused the migration of the latter. In Virginia the Episcopal had been a state church, and laws were in force to punish

non-conformity. The Baptists were at that time the subjects of the penalties and were then being imprisoned in the county where Madison lived, for "disturbing the public peace by their preaching." In a letter to Bradford, Jan. 24, 1774, Madison shows the intensity of his indignation at this renewal of religious persecution in words contrasting with his usual moderation: "That diabolical, hell-conceived principle of persecution," he writes, "rages among some; and to their eternal infamy, the clergy can furnish their quota of imps for such purposes." Again, writing to Bradford in April he says: "The sentiments of our people of fortune and fashion on this subject are vastly different from what you have been used to. That liberal, catholic, and equitable way of thinking, as to the rights of conscience, which is one of the characteristics of a free people and so strongly marks the people of your province (Pennsylvania), is but little known among the zealous adherents to our hierarchy."

The year 1774 was an exciting one in the colonies. New forms of oppression by the English government raised determined resistance from Boston to Charleston. Madison entered into the struggle in no half-way spirit, but seemed fully to appreciate from the beginning the necessity of speedy military organization to oppose the mother country. As early as Jan. 20, 1775, he writes a friend: "We are very busy at present in raising men, and procuring the necessaries to defend ourselves and our friends in case of a sudden invasion." In an address of thanks to Patrick Henry, written by Madison as the expression of a public meeting held in his own county May 9, 1775, we find this expression: "The blow struck in the Massachusetts government is a hostile attack on this and every other colony, and a sufficient warrant to use violence and reprisal in all cases in which it may be expedient for our security and welfare." Mr. Madison entered public life in May, 1776, as a delegate to the Virginia convention which instructed her delegates in the continental congress to propose the declaration of independence. Though the youngest man in that body, he was by special request made a member of the committee of ten to draft a new constitution for the state. In the committee Mr. Madison distinguished himself by opposing the use of the following phrase of an article on religion, designed to secure freedom of worship: "*toleration* in the exercise of religion, . . . unpunished and unrestrained by the magistrate, unless under color of religion any man disturb the peace, the happiness, or the safety of society," as a dangerous form of guaranty of religious freedom. Toleration, he maintained, belonged to a system where there was an established church, and where it was a thing granted not of right, but of grace. He feared the power, in the hands of a dominant religion, to construe what "may disturb the peace, the happiness, or the safety of society," and ventured to propose a substitute, which was finally adopted. It marks an era in legislative history; and is believed to be the first provision ever embodied in any constitution or law for the security of absolute equality before the law to all religious opinions. We give it entire: "That religion, or the duty that we owe to our creator, and the manner of discharging it, being under the direction of reason and conviction only, not of violence or compulsion, all men are equally entitled to the full and free exercise of it, according to the dictates of conscience; and, therefore, that no man or class of men ought, on account of religion, to be invested with peculiar emoluments or privileges, nor subjected to any penalties or disabilities, unless, under color of religion, the preservation of equal liberty, and the existence of the state be manifestly endangered."

At the first session of the Virginia legislature under the new constitution, beginning in Oct., 1776, Madison and Jefferson first met, and began an intimate friendship that lasted unclouded for half a century. Jefferson long afterwards thus describes him: "Mr. Madison came into the house in 1776, a new member and young; which circumstances, concurring with his extreme modesty, prevented his venturing himself in debate before his removal to the council of state in Nov., 1777. From thence he went to congress, consisting of few members. Trained in these successive schools, he acquired a habit of self-possession, which placed at ready command the rich resources of his luminous and discriminating mind and of his extensive information, and rendered him the first of every assembly afterwards of which he became a member. Never wandering from his subject in vain declamation, but pursuing it closely, in language pure, classical, and copious, soothing always his adversaries by civilities and softness of expression, he rose to the eminent station which he held in the great national convention of 1787. With these consummate powers was united a pure and spotless virtue which no calumny has ever attempted to sully."

In 1777 Madison lost his election by his conscientious abstention from the practice of "treating" on election day. But in November the assembly elected him a member of the council of state, a body of eight members, advisers of the governor, and participating with him in the exercise of executive powers. Chosen to this high position without his own knowledge, the compliment was not more appreciated by him than timely to the state, and a position of more importance during the crisis of war than one in legislative councils. The fact that Madison was the only member of the council versed in foreign languages made his services of additional value to the governor, Patrick Henry; as the number of foreigners in the employ of the state at that time was numerous.

It is told by him that the democratic sentiments of gov. Henry, as well as his own, were a little tried by the custom of French officers to address the governor as his royal highness monsieur Patrick Henry. On one occasion having to explain to a French

officer why power was given to the presiding officer of the delegates to preserve order according to rules established for that purpose, the officer exclaimed, "Ah! I understand you at last; he is a prince of the blood!" In 1779, Jefferson having succeeded Henry as governor of Virginia, Madison was re-elected to the council, but on Dec. 14 the Virginia assembly chose him to represent the state in the congress of the confederation, where he took his seat Mar. 20, 1780. It was the most gloomy period of the revolution. The country was without means or credit to feed the army; the continental money was nearly valueless, and there was nothing yet to take its place; the military situation most discouraging. The arrival of Lafayette, with news of the French fleet and army on its way, momentarily vivified the hope of the nation. But new reverses and the treachery of Arnold almost extinguished them. Mr. Madison had the sagacity to perceive that a better system of money was the radical need. Washington had advised requisitions on the several states for provisions and stores for his army to be furnished direct, in order to stop continental emissions of paper money for their purchase; but the states proceeded to purchase the required articles with their own paper money, thus aggravating the evil which he was hoping to lessen. Madison proposed that congress should address a formal recommendation to the states to discontinue these emissions. His proposition met with a cool reception, not because the recommendation was not approved, but because congress could with ill grace urge the states to abandon a means which itself had continuously employed. About this time efforts were being made by France and the United States to induce Spain to join the alliance against England. Spain required the abandonment of the right of navigation of the Mississippi to the sea as a condition precedent. Madison was made chairman of a committee to draw up the argument on behalf of the United States to be used as the basis of negotiations by Mr. Jay, our minister at Madrid, and Mr. Franklin our minister to France. The argument was unanimously adopted by congress. It is a curious fact that two of the oldest and most sagacious of American statesmen should thus receive their instructions from the most youthful and modest member of the congress. Madison's argument is a masterpiece of ability and discretion, but congress receded from its position. Spain's alliance was sought by the offer of the concession; but through the wisdom of Jay, fully seconding the views of Madison, no formal treaty to that effect was made.

After the capitulation of Yorktown in Oct., 1781, Madison was still strenuous that the government should not relax its preparations for the vigorous prosecution of the war; and secured action by congress to that end. At the same time he urged an amendment to the articles of the confederation, which should expressly grant to congress authority to employ the force of the union against the states in such manner as to force them to fulfill their engagements to it. In a letter to Jefferson, April 16, 1781, he thus alludes to the subject: "The necessity of arming congress with *coercive** powers arises from the shameful deficiencies of some of the states," etc. The letter entire is an admirable statement of the evils of a confederacy that has not the unity of power of a nation. It was not until the beginning of 1781 that the states were asked to vest in congress the power to levy duties on imports. On May 14, 1782, Madison in a letter to Randolph of Virginia gave intelligence of the arrival at New York of a bearer of peace-propositions from England. After reviewing the probable intent of the acts of the British parliament, he concludes: "Congress will, I am persuaded, give a proper verbal answer to any overtures with which he may insult them; but the best answer will come from the states, in such supplies of men and money as will expel our enemies from the United States."

After the recognition of the independence of the United States in 1782, Madison took a conspicuous part in every important legislation of congress; urged a system of national revenue; was principal author of the plan adopted April 18, 1783; and author of the address to the states urging its adoption, which, "for lucid exposition, pregnant conciseness and precision, dignity, eloquence, and force, will ever stand among the model state papers of America." It was in the preparation of this act of congress, and of the address which followed, that the opposition of Alexander Hamilton developed that great antagonism of principles and policy which, a few years later, became the basis of the opposing political organizations of the United States. Madison was the principal promoter of the cession of the north-western territories by Virginia to the United States on March 1, 1784. Vermont was, in 1784, to be admitted as an independent state. No provision had been made in the articles of confederation for the admission of new states. All lands outside the colonies, within the limits of the United States, were supposed to belong to one or another of the colonies. But the cession of Virginia's vast claims to the nation, and the denial of the Vermonters that their territory belonged either to the New York or the New Hampshire grants, opened new questions. Madison opposed the admission at this time and postponed it until the new constitution of 1787 was established. During this session congress entered on the difficult task of paying debts and harmonizing conflicting interests of states. The great state of Virginia was not able to pay its representatives in congress, and Madison was obliged to depend on his father in part for his support, and to have recourse to meet even the simple style of living that he always maintained, to "the favor," as he himself expresses it, "of Haym Salomon, a Jew broker." He returned to his father's residence Dec., 1783; and being ineligible to a con-

* Italics are in Madison's letter.

tinued seat in congress by Virginia's constitution he became an assiduous student of law. "My wish is" he wrote to a friend, "to provide a decent and independent subsistence without encountering the difficulties I foresee in that line. Another of my wishes is to depend as little as possible on the labor of slaves." In April, 1784, he was elected to the Virginia house of delegates. The leading idea of his service there he stated to be to harmonize the state legislation with the necessary assumption of powers required by the federal congress for its efficiency as a government of the United States. He was made chairman of the committee on commerce, of the committee to revise the constitution, and the "committee of religion." In all these he had occasion to imprint on the laws his peculiarly advanced statesmanship. In August, 1784, he met in Baltimore Lafayette, who was then on a visit of congratulation to his American friends, and they joined company in a journey to Ft. Schuyler, where a treaty with the Indians was to be made. Soon after the close of the second session of the Virginia assembly, Madison had another occasion to mark his influence in securing the disseverance of church and state, by exhaustive arguments in opposition to a pressure of petitions for "an assessment for the support of religion," which opposition he embodied in a remonstrance, and so aroused public opinion to its importance that when the bill was taken up the succeeding session it was overwhelmingly negatived. In 1785 Madison resumed his studies at home for a short time; made a visit to New York and the eastern states; to gen. Washington at Mt. Vernon; and returned to duty in the house of delegates in October, where he soon afterwards made a memorable speech to prove that the congress of the confederation should have sole jurisdiction over foreign and domestic commerce in the levying of import or export duties. At this session Madison bore the brunt of the laborious work of codifying the laws of Virginia. On returning to his home he added natural history to the list of studies which he entered upon with ardor, and at the same time pursued farther than before his studies in the philosophical speculations at that time the fashion among great minds, particularly in France. During 1786 he was an active participant in a politico-commercial convention assembled at Annapolis; opposed the project of Mr. Jay to surrender the navigation of the Mississippi to Spain; and re-entered the Virginia legislature in October. Its first work, of which he was one of the authors, was the passage of an act recommending the assembling of a convention of all the states for the formation of a new constitution for the United States. In this convention his thorough preparations for statesmanship became conspicuous. He completed and published papers, long in preparation, on *Ancient and Modern Confederacies; Vices of the Political System of the United States*, etc.; designed to light the way of the convention. He was sent as one of the delegates to that convention, associated with George Washington, Patrick Henry, Edmund Randolph, John Blair, George Mason, and George Wythe. In a letter to gen. Washington, April 16, 1787, he outlines his views at length of the future constitution: "Considering that an individual independence of the states is totally irreconcilable with their aggregate sovereignty, and that a consolidation of the whole would be as inexpedient as it is unattainable, I have sought for some middle ground, which may at once support a due supremacy of the national authority, and not exclude the local authorities wherever they may be subordinately useful. . . . An article should be inserted, expressly guaranteeing the tranquillity of the states against internal as well as external dangers. In like manner, the right of coercion should be expressly declared." It is doubtful if there ever convened an abler body of statesmen than met in the convention to frame the constitution of the United States, which opened in Philadelphia, May 14, 1787. Mr. Madison, if not the most conspicuous, was, by the volume of his labors, and his success in fixing his own views of government in the constitution, certainly the leading member, and it is in this sense that, young as he was compared with most of his associates, he acquired the title of "father of the constitution."

From the labors of the constitutional convention Madison repaired immediately to the federal confederate congress then sitting in New York, where he found strenuous opposition to the new instrument by Richard Henry Lee of Virginia and Nathan Dane of Massachusetts. Triumphing over these, his party in the congress secured a unanimous vote of that body to submit the constitution to the action of the several states. The various forms of opposition to it were met at the outset by a series of essays suggested by Alexander Hamilton and John Jay, in which Madison was invited to join, published over the signature of "Publius," first in a New York paper, but afterward as a distinct issue under the title of *The Federalist*. It grew under the hands of these gentlemen into one of the ablest compendiums of political thought ever published; finally comprising 85 essays, of which 51 were by Hamilton, 29 by Madison, and 5 by Jay. Judge Story in his treatise on the constitution styles it "an incomparable commentary." After eight states had voted their approval of the new constitution it only remained for the ninth to affirm it to secure its adoption. Virginia became the battle ground. A large part of her most eminent citizens took side against its adoption. Madison, at the urgent request of Washington, became a candidate for a seat in the Virginia convention called to take action upon it. The eloquence of Patrick Henry, and his tact in popular persuasion, was met in that convention by gov. Randolph in part, but more thoroughly and comprehensively by Madison; who, by his lucid reasoning, apt citations from his stores of historical knowledge, and masterly review of the errors of the opposition, turned the tide of

opinion in the convention. In the language of Bushrod Washington, who had listened to the debate, to gen. Washington, "Mr. Madison followed, and with such force of reasoning, and a display of such irresistible truths, that opposition seemed to have quitted the field." Yet the forensic battle raged for many weeks; Madison making in one day thirteen speeches in reply to Henry, Mason, Harrison, Monroe, and other brilliant leaders of the opposition. Voices of wisdom prevailed against voices of eloquence; and on June 24, 1788, Virginia ratified the constitution by the slender majority of 89 to 79. Chief justice Marshall being once asked who of all the public speakers he had heard he considered the most eloquent—and he had heard all the illustrious of his time—replied: "Eloquence has been defined to be the art of persuasion. If it includes persuasion by convincing, Mr. Madison was the most eloquent man I ever heard."

New York had not yet given its consent to the new constitution, and under the leadership of gov. Clinton continued to refuse it except under impracticable conditions, one of which was *the reservation of a right to withdraw from the union* if the amendments proposed by her should not be adopted within a limited period. Madison in a letter to Alexander Hamilton at this time writes his unqualified repugnance to all propositions of the kind, and regarded such a conditional ratification as worse than a rejection. At the request of gen. Washington he became a candidate for the new national senate under the constitution; but Richard Henry Lee of the opposition was supported by gov. Henry, and elected; after which Madison was elected from his own district to the house of representatives in congress, in spite of the formation of a district, by the legislature under the control of gov. Henry, for the express purpose of insuring his defeat.

On April 8, 1789, after the assembling of congress in New York and the inaugural address of Washington, Madison presented the first act under the new constitution, for the collection of revenues. This was followed by an act to levy tonnage duties on vessels of nations not having reciprocal commercial treaties with the United States, and especially designed to meet the hostile legislation of England, which had haughtily refused to enter into such treaty, and had excluded the vessels of this country from all trade with her West Indian colonies, admitting them to British ports only on special conditions; while up to this time British vessels had a monopoly of the foreign trade of America. He carried his measure, but against the determined opposition of the city of New York, which, being the capital, exercised an undue influence in the national legislation; and was, as Madison expresses it, "steeped in Anglicism." Early in the same session he brought in declaratory amendments of the constitution, in the nature of a bill of rights, to quiet apprehensions in the public mind which had given ground for much of the opposition to the constitution. On the re-assembling of congress in Jan., 1790, Madison's most conspicuous action was on the report of Hamilton, first secretary of the treasury, recommending the funding of the national debt. The secretary's report started lively speculation in the old state bonds and continental currency; the former being increased in value by their proposed assumption by the United States, and the latter resuscitated from no value to a certain low percentage of their face value. Madison advocated the payment of the domestic debt as equally obligatory as the foreign debt, but since it was impossible to pay the face value of the continental money in gold and silver, and the rate of valuation for payment had been agreed to, he could not consent that the speculators, who had bought these evidences of debt, should receive the whole, and the holders who had parted with them when they were supposed to be valueless should have little or nothing. He puts the case in these words: "As" to pay in full "would far exceed the value received by the public it will not be expected by the creditors themselves. To reject the claims wholly is equally inadmissible. To make the other class (original holders) the sole victims was an idea at which human nature recoiled. A composition then is the only expedient that remains. Let it be a liberal one in favor of the present holders; let them have the highest price which has prevailed in the market; and let the residue belong to the original sufferers." As this position aroused, from those who held these papers, a storm of opposition in favor of the commercial rigor of exact fulfillment, without reference to whose hands those papers were in, he replied: "He must renounce every sentiment he had hitherto cherished, before his complaisance could admit that America ought to erect the monuments of her gratitude, not to those who saved her liberties, but to those who had enriched themselves in her funds."

Madison opposed the assumption of the states' debts by the general government, and three times secured the defeat of the proposition; but it was at last carried by a compromise with those who desired the capital located on the Potomac. During this session of congress the federalists and republicans became distinct parties, Alexander Hamilton being the leading spirit of the former, and James Madison the foremost parliamentarian of the latter.

At the close of this session it devolved upon Mr. Madison to announce to the house the death of Franklin, which was done in words of simplicity as felicitous as the character they commemorated. The result of the first session of the 1st congress in New York was to give the representatives of the southern states a feeling of uneasiness as to the power of New England and New York to control all legislation, in which Mr. Madison participated. In the beginning of the second session a bill for the incorporation of

a national bank passed the senate. Madison opposed it in the house, argued its unconstitutionality, and united the southern states against it; but it was carried by the northern members. President Washington was in painful doubt whether to sign the bill. His attorney-general gave an elaborate opinion that it was unconstitutional. Jefferson was of the same opinion. Hamilton wrote an elaborate reply to prove its constitutionality. Washington requested Madison to reduce to writing the objections to the bill, with a view, it was supposed, to embody them in a veto; and Madison carefully prepared such a paper; but the president, at the last moment, signed the bill out of deference to the majorities which had passed it. Madison soon after opposed a congressional practice of calling on the heads of departments for their opinion; opposed again the assumption of the debts of the states; protested against the demoralizing effects of the banking and funding system of the secretary of the treasury; took spirited ground against the visitation of American ships by the British, and announced that the settled policy of law should be that "free ships make free goods." Washington, when his first term was near its close, requested Madison to prepare for him a valedictory address, which he did prepare; remonstrating with the former at the same time against his determination not to run for a second term. Washington did consent to a second election, and Madison's manuscript was preserved by him and included entire in his noble farewell address to the American people. In the third session of congress Madison made a vigorous criticism on the acts of Hamilton as secretary of the treasury in diverting public moneys, pledged to pay a debt to France, for the use of the national bank, to the discredit of the honor of the country; and, to a series of political articles written by Hamilton over the signature of "Pacificus," broaching doctrines as to the powers of the executive under the constitution, which Madison thought dangerous, he replied by a masterly series of five essays over the title of "Helvidius;" to which Hamilton made no reply. These were written from his father's farm after the close of the 2d congress. In the second session of the 3d congress Madison renewed his resolution for additional duties on the manufactures and shipping of those countries having no commercial treaties with the United States, being especially aimed to counteract the injurious effect of British discrimination against American commerce, embracing a specific retaliation for specific measures of hostile foreign legislation. This was not passed, but postponed till the next session, when new outrages on American commerce on the part of England called for the appointment of special commissioners to England. Towards the close of the session Madison reviewed the acts of congress in a pamphlet entitled *Political Observations,* now of great value.

In the recess of congress, on Sept. 15, 1794, Madison married Mrs. Dorothea Payne Todd, whose beauty, gracious tact, and kindness of heart and lively social qualities made her circle of admirers and her influence as extensive within her sphere, for the remainder of their lives, as her husband's; and as wife of the president, a few years later, she became the model of all the graces of life that adorn high stations.

The so-called whisky rebellion in Pennsylvania furnished Hamilton, secretary of the treasury, with an opportunity to invoke military force in its treatment, in a manner that indicated the tendency to the use of despotic force which was the characteristic of his statesmanship. Democratic societies had sprung up in the country somewhat in the intemperate style of the Jacobins of Paris. The federalists sought to obtain resolutions of condemnation by congress of these societies. Madison, while making no defense of their spirit, made such lucid expositions of the danger of such a resolution that it was finally negatived. The increase of the standing army was vigorously pressed by the federalists; Madison opposed it but the federalists prevailed. In Aug., 1795, he protested against a treaty with England, which yielded the right of search of American vessels, and which he speaks of as adding "to the ruinous bargain with that nation a disqualification to make a good one with any other." In the last session of the 4th congress he bore a conspicuous part in a three weeks' discussion on the constitutional limits of the treaty-making and legislative powers. President Washington assumed a position with reference to this subject that Madison felt called upon to oppose, and in doing so carried more than two-thirds of the house of representatives in his support, and made the precedent for a participation by the legislative department in carrying treaties into effect which has since become a principle of our government. His service in the house of representatives ceased with the administration of Washington.

In the beginning of John Adams's administration, the passage of the alien and sedition laws by the dominant federal majority gave rise to vigorous protests from the state legislatures of Kentucky and Virginia. The latter are known in history as the resolutions of 1798–99, and were drawn by Madison, though he was not a member of the state legislature. They now stand among the highest authorities on constitutional construction. Animadversions upon these drew from Madison the following winter a report in which he fortifies the positions taken in the resolutions by a state paper of signal vigor of style and exhaustive analysis of the reason and philosophy of the resolutions. Though few of the states followed the bold stand of Virginia at this time, the act of congress which called out the resolutions speedily fell into disrepute, and the legal position assumed by Madison became, a few years later, the settled law of public opinion.

On the inauguration of Jefferson as president in 1801, Madison was made secretary of state, and retained this ministerial position during the whole eight years of Jefferson's

administration. The harmony of his principles with those of the president produced a unity and ability of administration rarely continued for so long a period. It is, however, a curious illustration of the accident of events that during the whole time when gratitude, honor, and policy all required the most cordial relations to be maintained with France, and the most spirited opposition to the continued domineering policy of England, the federal policy had permitted a craven treaty to be made with the latter, and an offensive form of neutrality to be needlessly pushed in the face of our revolutionary ally; while now that the friends of that ally were in power, the tyrannous domination of Napoleon in the government of France had taken from our national sympathy its real object—to honor liberty and republicanism. At the close of Jefferson's term, Madison was the leading candidate of the republican party for his successor, and received in the electoral college 122 out of 175 votes. He was inaugurated president, Mar. 4, 1809. He made Roger Smith of Maryland secretary of state until April 2, 1811, when he was succeeded by James Monroe of Virginia; Albert Gallatin of Pennsylvania secretary of the treasury till Feb. 9, 1814, when he was succeeded by George W. Campbell of Tennessee; for secretary of war, William Eustis of Massachusetts till Jan. 13, 1813, when James Monroe acted as secretary of war, *ad interim*, till the appointment of W. H. Crawford, Mar. 3, 1815; for secretary of the navy, Paul Hamilton of South Carolina, till Jan. 12, 1813; succeeded by William Jones of Pennsylvania, till Dec. 17, 1814, and then by B. W. Crowninshield of Massachusetts; for postmaster-general, Gideon Granger of New York, succeeded by R. J. Meigs of Ohio; for attorney-general, successively, Cæsar A. Rodney of Delaware, William Pinckney of Maryland, and Richard Rush of Pennsylvania. The continued arrogance of British claims and acts of interference with American commerce, the seizure and impressment of sailors from American merchant ships, had brought the United States to the verge of war with Great Britain when Madison's administration began. An embargo on British commerce was ordered, followed by a non-intercourse act of congress, prohibiting commerce with France or England until the British orders in council relating to seizure of neutral vessels and impressment of seamen should be repealed; and the decrees of the French emperor concerning the rights of neutrals should be rescinded. Embroilments between the British minister and the American secretary of state followed. Madison requested the recall of the obnoxious minister. The English government recalled him but sent no other in his place. In August the French emperor revoked the obnoxious commercial decree, and in November Madison issued a proclamation for the renewal of trade with France, and of non-intercourse with England. But Napoleon's irritating maritime practices continued; and the prospect was imminent that the national dignity would require a state of war with both England and France. Madison made every effort to preserve peace, and prepared for war. Congress appropriated $1,000,000 for naval and military preparations. On June 1, 1812, he transmitted a special message to congress, reviewing the aggressions of Great Britain, and left it to the judgment of congress to declare war. It was done, and the president signed the declaration of war, June 18, 1812, and issued a proclamation to the people. June 23 following, Great Britain, before the news of the declaration had reached her government, repealed the most obnoxious of her orders in council. Monroe, secretary of state, before the British action could be known, submitted to the American minister in London terms of a proposition for an armistice to be suggested to the government. The London government refused the required concessions, and the American minister returned home. Admiral Warren, of the British navy, was sent out to negotiate with the American government; but yielding no promise to stop the impressment of American seamen, the war began. In Feb., 1813, a British fleet was in Chesapeake bay, and the whole coast of the United States was declared in a state of blockade. Madison had been elected the autumn before for his second term as president, by a vote of 128 in the electoral college to 89 for De Witt Clinton. His inauguration, Mar. 4, 1813, found the war fairly opened. The same month Alexander I. of Russia offered his mediation for peace, which was accepted by the United States and refused by Great Britain in September; but in November she signified a willingness to treat. In Jan., 1814, Henry Clay and Mr. Russell were sent to England for that purpose, but no progress was made, and in August the British troops captured and burned the public buildings of Washington, including the president's house The damages inflicted on British commerce by our privateers, and the battle of New Orleans, brought about a treaty of peace, which was signed by the United States commissioners at Ghent, Dec. 24, 1814. But it contained no concession of the British claim to impress seamen; which, however, though not yielded in theory, was abandoned in fact. The country had made brilliant successes in naval battles with English ships, and had acquitted itself not without honor in its land engagements; but the war developed a low order of patriotism on the part of the commercial or maritime interests of the country, which not only impaired its vigor, but pressed for peace with mercenary haste. The last three years of Madison's administration were marked by no important events, unless his concession to the establishment of a national bank, which he had always opposed, and once vetoed, may be considered one. Its subsequent dishonorable history was a proof of the soundness of his previous objections. Mr. Madison retired from public life with the close of the presidential term, Mar. 4, 1817, to his farm at Montpelier, Va., where he lived his remaining years happy in domestic affection, social enjoyments, farming, and literary labors. In 1829 he per-

formed his last public service, as a member of the Virginia constitutional convention, where his frail and venerable figure and broken voice received the homage of the most profound attention and respect. His wife survived him, living to the age of 82, and died in Washington, July 12, 1849.

MADISON, JAMES, D.D., 1749–1812; b. near Port Republic, Va.; a second cousin of president Madison; graduated at William and Mary college in 1768; was admitted to the bar, but relinquished the law for the ministry; was chosen professor of mathematics in William and Mary college in 1773, and president in 1777. In 1775 and 1777 he visited England, and devoted his time to the study of the higher branches of science. In 1784 he became professor of natural and moral philosophy; in 1790 was consecrated the first bishop of Virginia by the archbishop of Canterbury in Lambeth palace, and also performed the duties of president and professor until his death. Besides some addresses, he published *Eulogy on Washington;* a large *Map of Virginia;* some papers in Barton's *Journal,* and in the *Transactions* of the American society.

MADISON UNIVERSITY, at Hamilton, Madison co., N. Y.; a Baptist institution, was founded as a seminary in 1820; reorganized into an academy, college, and theological seminary in 1832, and chartered under its present name in 1846. It has an endowment of $430,000 (mostly raised since 1864), an annual income of $38,234, and unproductive property amounting to $150,000. It has a library of 11,000 volumes, a fine museum, a cabinet of minerals, and a laboratory and apparatus. The site, elevated about 60 ft. above the waters of the Chenango and the plain below, having pure springs of water in the rear, and in front the village of Hamilton, presents a landscape of great loveliness, and for the student, a home of health and beauty. Besides a president's house, professors' houses, gymnasium, and university boarding hall, there are three edifices of stone, used strictly for college purposes. The hall of alumni and friends, 107×73 ft., has ten lecture rooms, a library, a college chapel, and a large audience room, 107×73 ft., for college commencements. West college, 100×60 ft., and East college, 100×56 ft., are mainly occupied by students' rooms and dormitories; but East college has two halls for literary societies and two academical drill-rooms. West college has, also, an auditorium, a museum of foreign curiosities, a museum of natural history, and a set of rooms for chemistry, geology, and physics. The university awards $500 a year as prizes, and pays of itself $4,500 annually to students on scholarships, and over $5,000 more, through the education society, for the benefit of the needy. Number of instructors in 1880, 22; students in college, 88—in theological seminary, 38. E. Dodge, D.D., LL.D., president.

MÄDLER, JOHANN HEINRICH, 1794–1874; b. Prussia; at first an instructor in the Berlin normal schools. He published a map of the moon, 1834–36; and the latter year he was appointed to a position in the Berlin observatory. The next year his *Allgemeine Selenographie* appeared, in two volumes. In 1840 he was made director of the observatory at Dorpat, where he published, in 1846, *Die Centralsonne,* in which he propounded the theory that the star Alcyone in the Pleiades is, or in its position represents, the center of the stellar universe. He also published a popular astronomy and a history of astronomy. His researches in regard to variable and double stars are of great value, and he ranks as one of the eminent astronomers of the century.

MADOC, son of Owen Gwynnedd, a Welsh prince, is believed by his countrymen to have discovered America about 300 years before Columbus. Compelled, it is said, by civil strife to abandon his native land, he sailed westward in 1170 with a small fleet, and after a voyage of several weeks, reached a country whose productions and inhabitants were quite unlike those of Europe. Here he lived for a long time; then returning to Wales, he gave an account of the new land that he had discovered, equipped another fleet, set sail again, and was never more heard of. The story of Madoc will be found in the *Historie of Cambria, now called Wales, a part of the famous Yland of Brytaine, written in the Brytish Language above 200 years past by Caradoc; translated into English by H. Lloyd, gent.; corrected, augmented, and continued by David Powell* (London, 1584). See also Owen's *British Remains* (1777). There is considerable reason for suspecting the genuineness of this Welsh tradition; and even if true, the Northmen have a prior claim to the discovery of America, for it is beyond doubt that Greenland and the New England states were visited, if not colonized, by Icelanders or Norwegians at a much earlier period. Southey has chosen the story of Madoc as the subject of one of his so-called "epics."

MADONNA, an Italian word signifying *my lady,* and specially applied to the Virgin Mary. It has now become common in other languages, particularly in reference to works of art. The earliest Christian art, however, did not attempt any representation of the mother of Christ; such representations first make their appearance after the 5th c., when the Virgin was declared to be the "Mother of God." The face of the mother is generally full, oval, and of a mild expression; a veil adorns the hair. At first, the lineaments of the Virgin's countenance were copied from the older pictures of Christ, according to the tradition which declared that the Savior resembled his mother. A chronological arrangement of the pictures of the Virgin would exhibit in a remarkable manner the development of the Roman Catholic doctrine on this subject. The Madonna has been a principal subject of the pencils of the great masters. The grandest success has been

achieved by Raphael, in whose pictures of the Madonna there prevails now the loving mother, now the ideal of feminine beauty, until in that of St. Sixtus he reaches the most glorious representation of the "Queen of Heaven." Among symbolic representations may be mentioned Mary with the white mantle, i.e., the mantle of love under which she receives the faithful; and the Virgin with the half-moon or with the globe under her feet, according to the meaning put upon the twelfth chapter of Revelation. The Virgin was never represented without the child until comparatively recent times. For further information, the reader should consult Mrs. Jameson's delightful work, *Legends of the Madonna* (Lond. 1852).

MADOCKAWANDO, about 1645–1700, an Indian chief of the Etchemin tribe of the Penobscot. In the French and English wars he at first favored the English; but a French baron having married his daughter, he took the other side and for years devastated the New England borders.

MADOQUA, *Antilope saltiana*, or *Neotragus saltianus*, a species of antelope, abundant in Abyssinia; one of the smallest, if not the very smallest of horned animals, being scarcely the size of a hare. Its legs are long and slender; its tail very short; its horns short and conical, the males alone having horns; the general color is gray, the fore-parts reddish.

MADOU, JEAN BAPTISTE, 1796; b. in Brussels; early distinguished for his talent in depicting picturesque phases of life. In 1855 he sent to the exposition of Paris two pictures entitled a "Trouble-fête" and the "Fête-au-Château" for which he obtained the second medal and the cross of honor. He became professor of the royal school of Brussels and member of the academy of Antwerp. In 1821 he published a superior lithographic work entitled *Voyage Pitteresque dans le Pays Bas*, which attracted much attention. This was followed by works on the ancient and modern costumes of the Low Countries, and scenes in the lives of the Flemish and Holland painters. His latest work was *Physionomie de la Société en Europe, de Louis XI à nos Jours*, with 120 plates, 1835, which has a high value.

MADOZ', PASCUAL, 1806–70; b. Spain; was educated at Saragossa, but was expelled from the university as a schismatic, and resided for some time in France. He returned to Spain, and edited the *Diccionario Geográfico Universal*, and a *Coleccion de Causas Célebres*. He became prominent in politics, was appointed a judge, and was made military governor of the valley of Aran. In his new office he conducted operations against the Carlists, and was elected a member of the cortes. He opposed Espartero, and eventually took the lead of the party known as *progresista* in the cortes. He became minister of finance in 1855, but retired after holding the office a few months, and in the following year opposed the O'Donnell ministry and was obliged to flee. He was active in the revolution of 1868, was governor of the province of Madrid, and a member of the constituent cortes. He died while accompanying the Spanish deputation to Rome, to offer the crown of Spain to Amadeus. He left an important work of which he was both editor and publisher, printing it in the office which he had established. This work is the *Diccionario Geográfico Estadistico y Historico de España;* 16 vols. 4to, Madrid, 1848–50.

MADRAS', one of the several local governments of British India, still commonly called the "presidency of Madras," occupies the southern part of the Indian peninsula. The 21 districts immediately under the governor of Madras had in 1871 a pop. of 31,672,613, and an area of 138,318 English sq.m.; and the tributary states of Travancore, Pudukota, and Cochin, with an area of 9,471 sq.m., have a pop. of 3,226,427. Mysore is for military purposes attached to Madras. On the Malabar coast, where more rain falls than on the eastern side of the peninsula, the mean temperature is 78°; on the Coromandel coast the average is 84°, and the barometer occasionally stands at above 100°. Rice, cotton, indigo, coffee, sugar, maize, millet, are extensively cultivated, and the minerals are iron, manganese, copper, magnesia, antimony, lead, and silver. The revenue for 1876 was £8,360,488; the expenditure, £5,991,449.

MADRAS (called by the natives *Chennapatanam*, "the city of Chennappa," an Indian prince), a maritime city of British India, capital of the government of the same name, is situated on the Coromandel coast, the western shore of the bay of Bengal, in lat. 13° 5′ north. No commercial center of equal size and importance is so unfortunate in its site. The roadstead is open to every wind except that from the w., and in the case of a sudden gale, vessels are obliged to run for the open sea. The city is not built on a navigable river; the soil of the vicinity is but moderately productive; and during the hot months the thermometer, even in a well-appointed room, rises to 96°. In calm weather the surf breaks 300 ft. from the shore, and its wave is 3 ft. in height; during a storm, it breaks 1000 ft. from shore, with a wave 14 ft. high, and at such a time any attempt to land, even in the boats of the natives built for this purpose, is most dangerous. The seasons are distinctively marked by the monsoons, the n.e. lasting from October to February and the s.w. from May to October. The force of the latter, however, is so much broken by the Ghats that its influence is hardly felt. During the hot months, the climate of Madras is pleasantly modified by a sea-breeze, called by the residents "the doctor," which sets in at noon and lasts till night. The city, with its suburbs, which are nine in number, extends along the coast for 9 miles, and has an average breadth of 3½

miles. On the coast, and midway between the n. and s. extremities of the city, is fort St. George, strongly fortified, and garrisoned usually by a regiment of European troops and two companies of artillery; there are also, however, three regiments of native infantry generally stationed here. Within the fort are comprised the council-house and a number of civil and military offices. The district of Black Town, n. from the fort, lies low, in some places being only 6 in. above sea-level at spring-tides. It is defended, like the fort, from the encroachments of the sea by a strong stone bulwark. In Black Town are the seven wells, the water of which, filtered through a bed of fine sand, is exceedingly pure and wholesome. The principal buildings and institutions are government house, a handsome edifice, though much inferior to the similar establishments in Calcutta, and even in Bombay; the light-house, to the n. of the fort, 128 ft. above sea-level, and having a light, said to be one of the most brilliant in the world; the Scotch church of St. Andrew, founded in 1818, a stately and beautiful edifice; the university, with European professors, and numerous teachers, both European and native, and containing a valuable museum and a library; St. George's cathedral, from which a magnificent view of the city and its vicinity may be obtained, and containing several monuments by Chantrey (including one of bishop Heber), and some figures by Flaxman. There are also military male and female orphan asylums, a medical school, a branch of the royal Asiatic society, the Madras polytechnic institution, the government observatory, a mint, the churches of numerous Christian denominations, and the Madras club, to which members of the Bengal and Bombay clubs are admitted as honorary members. Madras stucco, or *chunam*, is largely employed in the decoration of public buildings. When laid upon walls, pillars, etc., dried and polished, it has the appearance of the finest Parian marble. The first British settlement on this coast was at Armagon, 60 m. n. of Madras; but the seat of the present fort being granted by a native prince in 1639, a removal took place, and the nucleus of the present city was at once formed. Madras is now the residence of the government of the presidency, including the governor, the members of council, etc., and of the judges of the supreme court. The tables of Europeans in this city are supplied with beef, mutton, and many other home luxuries. Pop. '71, 397,552 of whom about 20,000 are Europeans, and the great body of the remainder Hindus. The chief articles of export are rice, cotton, hides, skins, and especially coffee. The value of the exports from the Madras ports in 1876 was £4,548,830. The imports for the same year amounted in value to £2,038,330. Madras has telegraphic communication with England, and therefore America; and, in 1871, cables connecting it with Hong-Kong were laid. Madras has railway communication with Bombay, Calcutta, and consequently with the main system of Indian lines.

MADRAS SYSTEM. See MUTUAL INSTRUCTION.

MAD'REPORE, *Madrepora*, a genus of zoophytes (*anthozoa*), the type of a family, *madreporidæ*, in which the polyps have twelve short tentacles, and the polypidom is stony. The name, however, is often more extended in signification, and popularly is not clearly distinguished from CORAL. The polypidom is sometimes arborescent and branched, sometimes spread out in a leaf-like form. The cells in the true madrepores are isolated and lamellated, spread over the surface of the polypidom like little stars. The variety of forms among the madrepores is very great, and many of them are very beautiful. They are all found in the seas of warm parts of the world. The *astræas* are generally in large convex masses, the surface hollowed with crowded stars. They increase with great rapidity, as do some of the other madrepores, and are often found in huge masses, composing some of the most recently formed rocks.

MADRID', a province of central Spain, in New Castile, bounded by the provinces of Toledo, Segovia, Avila, Cuenca, and Guadalajara; watered by the Tagus river; 2,997 sq.m.; pop. '70, 487,482. It is a mountainous region, with a mean elevation above the sea level of 3,500 ft., a severe climate, and little vegetation. In the s. and w. parts, where the soil is fertile, there is a large yield of hemp, barley, oats, wheat, and rye; and there is a slight production of olive oil and wine. Capital, Madrid.

MADRID', the capital city of Spain, in the province of the same name in New Castile (see CASTILE), is situated near the center of the country, on the left bank of the Manzanares, a small stream whose waters join those of the Jamara, an affluent of the Tagus. It is built on a hilly, barren, and ill-watered plateau, 2,060 ft. above sea-level, offering on the one hand, no protection against the bitter n. winds from the snowy peaks of the Guadurrama mountains, and on the other, open to the *Solano*, the south-eastern wind, which, aided by a glaring sun, often raises the temperature to 90° and even to 105° in the shade. In winter, the temperature sometimes falls to 18°. Summer, however, is the most trying period. During this season, the sunny and shady sides of the same street may differ 20° in temperature. Not without justice has the climate of Madrid been proverbially described as *tres meses de invierno y nueve del infierno* (three months of winter and nine months of hell). The rate of mortality is 1 in 30 to 34. The city is circular in shape, and is surrounded by low walls pierced by 16 gates. It contains 32 churches, 14 barracks, 13 hospitals, 18 public libraries, 4 foundling hospitals, 13 royal academies, numerous elementary schools, a university, 7 leading and numerous minor theaters, an ample supply of newspapers, many literary and artistic institutions, above a dozen nunneries—44 monasteries were suppressed in 1836. The number of palaces is great. The

principal architectural feature is the royal palace (*palacio real*), a splendid edifice, built of granite, and of a stone resembling white marble. It is a square 470 ft. in length on each side, and 100 ft. in height, and incloses a court 240 ft. square. There are two libraries, the public and the private royal libraries: the former, containing 230,000 vols., is well kept and tended; the latter, with 100,000 vols., is rapidly falling to decay. The royal armory is one of the finest in the world; the Toledo blades, the artistic armor, and shields from Augsburg and Milan, are superb. The armory contains relics of the greatest Spanish epochs, and furnishes in itself a realization of Spanish history. The *Museo*, said to be one of the finest picture-galleries in the world, besides specimens of many other famous painters, contains 10 of Claude, 22 of Van Dyck, 16 of Guido, 46 of Murillo, 21 of N. Poussin, 10 of Raphael, 62 of Rubens, 52 of Teniers, 43 of Titian, 27 of Tintoretto, 62 of Velasquez, 24 of Paul Veronese, and 10 of Wouvermans. Of all these pictures, the most wonderful are those by Velasquez, whose finest work is here, and who, indeed, can here only be studied to advantage. The general aspect of Madrid is that of a new city, with fine houses, streets, and squares. In the squares are numerous statues—as that of Philip IV. (in the *plaza de Oriente*), a splendid equestrian work, 19 ft. in height, and weighing 180 cwt.; the statue of Cervantes, etc. In and around the city, also, are numerous public walks. The manufactures of the city are unimportant. The artisans and tradesmen are supported by the court, the nobility, the officials, and the innumerable body of place-hunters. Pop. '70, 332,024; of the province, 484,541.

The first historical mention of Madrid occurs under Ramiro II., king of Leon, who took this city in 932. In 1083, when Madrid, or, as it was then called, Majerit, was captured by Alfonso VI. of Castile, it was merely a Moorish fortified outpost of Toledo. It rose into some importance in the beginning of the 16th c., when Charles I. (afterwards the emperor Charles V.) removed his court hither. In 1560 is was declared the only court by Philip II. A number of memorable treaties have been concluded in Madrid, and bear its name, particularly that between Charles V. and Francis I. of France in 1526; that between Spain and Venice in 1617; and that between Portugal and Spain in 1800. In the Spanish war of succession, it favored the French party; and in the war of freedom against France, it gave the signal for a general rising by an insurrection against Murat on May 2, 1808, in which 1500 of the citizens of Madrid lost their lives. From 1809 till 1812 it was held by the French; but in the latter year, the duke of Wellington entered it and replaced it in the hands of its legitimate rulers. Madrid, always opposed to the Carlists during the recent civil strife of Spain, adopted the cause of king Alfonso in 1874.

MADRIGAL, a word of uncertain etymology, denotes a short lyrical poem, adapted to the quaint and terse expression of some pleasant thought, generally on the subject of love. The proper madrigal consists of three verses or strophes, generally bound together by rhymes; but this form is not always adhered to, and the name is sometimes applied to little love-poems of any form. Among the Italians, the best writers of madrigals are Petrarch and Tasso; among the French, Montreuil, Lainez, and Moncrif; among the Germans, Ziegler (the earliest), Voss, Manso, Goethe, and A. W. Schlegel; and among the English, the poets of the Elizabethan and Caroline ages, several of whom, such as Lodge, Withers, Carew, and Suckling, have written verses, sometimes called madrigals, sometimes songs, the grace and elegance of which have never been matched.—The name madrigal is also applied to pieces of vocal music of a corresponding character. The musical madrigal, which originally was a simple song sung in a rich artistic style, but afterwards with an instrumental accompaniment (generally the organ), is believed to have originated with the Flemings, and dates from the middle of the 16th century. It went out of fashion about the beginning of the 18th c., but the later *glee* may be regarded as a similar composition. The English madrigalists are especially famous. Neither Italy nor the Netherlands has produced greater names than Morley, Wilbye, Bennett, Ward, Orlando Gibbons, Dowland, and Ford.

MADURA, a maritime district in the s. of British India, in the presidency of Madras, is bounded on the e. by the strait which separates Hindustan from the island of Ceylon. It has an area of 9,502 sq.m., and a population in 1871 of 2,266,615. Eastward from the shore runs a narrow ridge of sand and rocks, mostly dry, and which almost connects Ceylon with the continent. Cotton is the chief commercial crop; and sugar-cane, betel-nut, and tobacco are also grown. The principal town is Madura, on the river Vygat, with several noteworthy public buildings.

MADU'RA, the capital of the district of Madura, in the province of Madras; 270 m. s.w. from the city of Madras; pop. 36,000. It was anciently the seat of the Pandian kingdom, which was founded 500 B.C. Ambassadors from the king of Pandya visited Rome in the time of Augustus. Early in the Christian era a college was founded here for the cultivation of Tamil literature, and was distinguished throughout India for the learning of its professors. They took great pains to keep the language free from Sanskrit words, which were then beginning to be brought from the north, and to this day no Tamil is there considered pure that has any mixture of the northern tongues. The last sovereign, queen Menakshi Amman, was dethroned by Chunder Saib, 1736; from 1740 to 1760 the city was repeatedly besieged, and was often in the hands of rebels. Till recently it had a double wall with 72 towers surrounded by a ditch from 60 to 70 ft.

wide. Some of the native edifices give evidence of ancient splendor, but most of the dwellings are very inferior. The temple of Meenarchi or Fish mother is in the center of the city, and is the fourth of the seven strongholds of idolatry in India. It is said to have been partially destroyed in the flood of Menu, and to have been rebuilt by Sekhara Pandian in the 2d or 3d c., to have been nearly destroyed during the second Mohammedan conquest in the 14th c., and renewed by Viswanatha Naick. Its present splendor is due to Tirumal Naick, the last rajah, who reigned 1622–62. The outer wall of the temple is a parallelogram of 800 by 700 ft., within which are 50 buildings devoted to the various purposes of the temple worship, and the use of those who conduct it. The wall is of granite with a parapet of brick, and is 37 ft. high. The main entrances are by four gateways 30 ft. high, through towers 50 or 60 ft. wide at the base which rise in 11 stories to the height of 150 feet. One choultrie or rest-house within the inclosure built by Tirumal Naick is 312 ft. by 125, the roof supported by 162 columns, many of them wrought from a single stone. Fifty-four of these columns are 30 ft. high, of 2 stones fitted face to face so as to look like one solid block 4½ ft. thick, carved on all sides with life-size figures in full or in bas-relief. The granite roof of one room is supported by 1,000 columns, and the columns in the whole temple number 10,000. There are also remains of a palace of considerable magnificence built by Tirumal Naick. Madura has been the metropolis of Hinduism for southern India. Early in the 17th c. a Roman Catholic mission was established here, and continued for about 150 years. In 1837 the mission was re-established, and has prospered. Up to 1835 no Protestant missionary had ever resided in the city. In that year a mission was established by the Rev. Daniel Poor and others of the American board, and much has been accomplished for the enlightenment of the people. From this center Christian work has extended to several other cities and many villages; between 30 and 40 native churches have been formed, more than 150 native congregations gathered, and about 7,000 converts recorded; a large number of children are under instruction in over 100 schools, and there are faithful educated native pastors, catechists, and teachers.

MADU'RA (Sanskrit, sweet), an island, separated by a narrow strait from the n.e. of Java, in 6° 52′ to 7° 17′ s. lat., and 112° 39′ to 113° 9′ e., long., about 90 m. long and 24 broad. It consists of three kingdoms—Madura, west; Pamakasan, middle; and Sumanap, east. The princes are vassals of the Dutch, but Pamakasan only is directly under their rule; and the prince, who is colonel, has a small active army trained by European officers, and maintained at the cost of the Netherlands.

On Dec. 31, 1873, the pop. was 731,321, of whom 719,238 were natives, 478 Europeans, 5,547 Chinese, and 8,383 Arabs, etc. Births, 26,396; deaths, 13,993. The natives are active, honest, brave, and industrious, but quick-tempered and revengeful. They are mostly Mohammedan. They quarry stone, burn lime, make saquerus palm sugar, vegetable oils, mats, and baskets; weave coarse fabrics, make salt; carve wood, fish, and cultivate rice, maize, tobacco, indigo, etc. The rivers are small, and the hills never attain to a great height; Padjūdan, the highest, being 1364 ft. above the sea. In some districts petroleum springs out of the ground, and is burned in lamps. A low chain of limestone hills crosses the island. The exports are sugar, tobacco, indigo, cocoa-nut oil, edible nests, stone, trepang, buffaloes, horses, and horned cattle.

MADURA DISTRICT (*ante*), bounded n. by the district of Trichinopoly and Coimbatoor, e. by Tanjore and Palk's strait, s. by the gulf of Manaar, w. by Travancore. The principal river is Vygah, which after a course of 180 m. falls into Palk's strait. The district has an elevated range of mountains, the highest peak being 7,000 ft. above the level of the sea. The district of Madura has four general divisions, which are subdivided into talooks or counties. In the entire district there are 1015 villages, and a population of 1,306,725. The climate of the hills is mild in summer, but cold in January; that of the plain is dry and hot; the thermometer sometimes reaching 115°. It partakes of the vicissitudes of the two monsoons. The district came into the possession of the English in 1801.

MADVIG, JOHANN NIKOLAI, b. at Svanike, in the island of Bornholm, 1804; was educated at the university of Copenhagen, and obtained there the professorship of the Latin language and literature when he was only 25 years of age. Although his life has been chiefly devoted to philological studies, and to the careful editing of classical works, he has held important official positions in Denmark, where he was minister of public worship in 1848, director of public instruction in 1852, and a member of the diet in 1854. He has published a *Glance at the Constitutions of Antiquity;* a *Latin Grammar for Schools; Adversaria Critica ad Scriptores Græcos et Latinos; The Creation, Development, and Life of Language;* and other works.

MÆANDER (now *Meinder*), the ancient name of a river of Asia Minor, rising near Celænæ, in Phrygia, and flowing in a s.w. direction into the Icarian sea at Miletus. It is noted for its numerous windings—whence the English word *meander*, applied to any stream, signifies to flow in a winding course.

MÆCE'NAS, C. CILNIUS, a Roman statesman, celebrated for his patronage of letters, was b. in the early part of the first century before Christ. His family was of Etruscan origin, and of royal descent (Hor. *Carm.* i 1), perhaps from Porsena. He received an

excellent education, was familiar with Greek and Roman literature, and occasionally did a little in the way of authorship himself. His first appearance in public life dates after the assassination of Julius Cæsar (44 B.C.), when he figures as the friend and adviser of Octavian. He had, it is clear, a talent for private diplomacy, and was employed mainly in that capacity. He "arranged" a marriage between Octavian and Scribonia, made up (temporarily) the differences between Octavian and Antony, and brought about the peace of Brundisium. In 36 B.C. he was in Sicily, helping Octavian, as usual. Five years later, when the latter was fighting the great and decisive sea-battle of Actium with his rival Antony and the Egyptian princess Cleopatra, Mæcenas proved himself a vigilant governor of Rome by crushing a conspiracy of the younger Lepidus, and thereby preventing a second civil war. When Octavian became emperor under the title of Augustus (a step which he is said to have taken by the advice of Mæcenas, who was profoundly impressed with the necessity of a "strong government" to repress the anarchic elements of the period), the latter was appointed administrator of all Italy. The nature and extent of his official power are not very precisely understood, but they were undoubtedly great, though the influence and authority of Mæcenas are to be estimated rather from his intimacy with the emperor than his mere position as a public servant. This intimacy —friendship it might, perhaps, be called—continued uninterrupted for many years; but some time before 16 B.C. it was ruptured from causes which cannot now be ascertained. No enmity, however, ensued. Mæcenas was a thoroughly sincere imperialist. He had a belief in the value of an established government; and when he found that he no longer retained the confidence of his sovereign, he did not lapse into a conspirator; but, as a modern minister might do, retired into the obscurity of private life. Literature and the society of literary men now occupied all his time. He was immensely rich, and kept an open table for men of parts at his fine house on the Esquiline hill. Mæcenas's intercourse with Horace especially was of the most cordial nature, and equally honorable to both. So far as personal morality went, Mæcenas was a thorough pagan—not a bad man in the usual sense of the word, but copiously addicted to sensual delights. His adulteries—if not worse—were the talk of the city; he dressed effeminately, had a passion for theatrical entertainments, paid great attention to cookery, gardening, etc.; and, in short, in his theory of life, was an epicurean of "the baser sort." It does not, therefore, surprise us to find that he was a valetudinarian and a hypochondriac, and that he died childless, 8 B.C. He left the bulk of his property to Augustus.

MAE'LAR, LAKE, one of the largest and most beautiful lakes in Sweden, about 81 m. in length; its average breadth about 13, and its area about 525 sq. miles. It contains upwards of 1200 islands. Its e. end is close by Stockholm, where its waters are poured into the Baltic sea, the difference of level being scarcely six feet. The banks are very much varied with wood, lawn, and cliffs, and are adorned with many castles, country-seats, and villas. They are very fertile, and well cultivated, and upon them are, besides Stockholm, the towns of Enköping, Westeras, Köping, Arboga, Strengnäs, Thorshälla, Mariefried, and Sigtuna.

MAELSTROM. See MALSTRÖM, *ante*.

MAERLANT, JAKOB, 1235–1300; a Dutch poet, regarded as the father of poetry in the Low Countries. His *Heimelijkheid der Heimelijkheden* was published in Dort in 1838; *Wapen Martijn* in Antwerp in 1496 and in Dort in 1834. In 1270 he completed a versified version of the Bible, *Rijmbibel*, published in 1858–60. In 1283 he wrote *Spieghel Historiael*, and among his works is one entitled *Der Naturen Bloeme*, published in Brussels in 1857.

MAESHOWE', an artificial mound with an interior chamber, of unknown antiquity, situated on the main-land of Orkney, about 9 m. in a westerly direction from Kirkwall, and little more than a mile from the famed standing stones of Stennis. Maeshowe is described as follows by Dr. William Chambers in a work (*My Holidays*) privately circulated in 1867: "It is situated in an open, heathy spot; outwardly there is little to be seen—only a circular grassy tumulus, or barrow, as it is called by antiquaries, measuring 36 ft. high, and about 92 ft. in diameter at the base, at which a low door presents itself. Made aware of our errand, a girl from the neighboring farm-house arrives with the key of the door, a couple of candles, and a box of lucifer matches. We have also bits of candles with us; and with the whole lighted, we enter the aperture, crouching as we advance along a passage varying from a width of 2 ft. 4 in. at the entrance, to 3 ft. 4 in. at the opening into the interior chamber. The height, low at first, expands to 4 ft. 8 inches. The passage is formed by slabs of stone, above, below, and along the sides. On issuing into the central chamber, our candles at first feebly enable us to comprehend its dimensions. These we at length discover. We are in a vault built of slabs of stone, measuring 15 ft. square, except at the corners, where there are buttresses. The height is 13 feet. On each of the sides, except that with the entrance, at a height of 3 ft. from the floor, there is a square opening to a cell or recess, the largest of which is 7 ft. in length by 4 ft. 6 in. in breadth. The roof of the vault had originally been constructed with slabs advancing successively layer above layer to the center; but as a result of recent repairs, when the structure was cleared out and restored to something like its former condition, the roof is now partly composed of arched masonry, with an aperture for ventilation. As can be easily supposed, this strange subterranean chamber is cold and

clammy. The slabs of stone are wet with damp, and nothing induces a protracted stay but the wish to examine certain Runic inscriptions and emblematic or fanciful figures carved on a few of the stones. These carvings were discovered only at the opening and repairing the chamber, an operation undertaken at the instance of Mr. James Farrer, M.P., a learned and enthusiastic antiquary. In a privately circulated work on Maeshowe, by Mr. Farrer, and also in a work by Mr. J. M. Mitchell, the carvings have been explained partly through the assistance of Norwegian scholars. All refer to Vikings and other Scandinavian heroes, or to transactions in the middle ages. According to Mr. Farrer's interpretation, it signifies: 'Molf Kolbainson carved these runes to Ghaut'—Ghaut being possibly a comrade who fell in battle. Mr. Mitchell's translation runs thus: 'Tholfe Kobainsson cut these runes (on) this cave.' Such is a pretty fair specimen of the interpretations of the different inscriptions; scarcely two persons agreeing in the signification. [We have reason to believe that the diversity here referred to arises from the fact that imperfect transcriptions of the Runes had been submitted to the foreign scholars who acted as interpreters. We are sorry to learn that damp is likely soon to deface these interesting inscriptions.] Several purport to refer to hidden treasure, a circumstance which throws a degree of ridicule over the whole, for no one carves inscriptions on stones, telling the world where money is secretly deposited. Of the emblematic or fanciful figures, nothing can be made. One is a figure of a horse with an animal like an otter in its mouth, a second is a winged dragon, and a third is a worm knot. These figures may represent the names of ships, or may be whimsicalities signifying nothing.

"There is nothing in these runes to explain the origin or use of the structure. We are left to conjecture that it was erected as a sepulchral vault in extremely remote times; and being opened by Scandinavian rovers, in the hope of discovering hidden treasure, they used it as a resort or hiding-place, and carved the inscriptions which still remain to attest their visits. Obviously the building and the passage communicating with it were erected on the open plain, and then covered with the earth which forms the tumulus. There is at some distance an environing mound and ditch, still pretty entire. The whole structure bears a resemblance to the vaulted tumuli in other parts of the British islands. In one at Newgrange, on the banks of the Boyne, near Drogheda, the walls are composed of tall blocks set on end; whereas, at Maeshowe, the slabs are built one above another (without mortar), as in an ordinary wall. This general resemblance points to a common origin." Capt. Burton's *Ultima Thule* (1875) asserts a resemblance or connection between the runes of Maeshowe and a Syrian cipher called El Mushajjar. For a minute account of Maeshowe, see a paper by Mr. John Stuart, secretary of the Scottish society of antiquaries, 1867.

MAES, or MAAS, NICOLAS, 1632–93; a Dutch painter, pupil of Rembrandt; Acquired a fortune by his skill as a portrait painter at Amsterdam, and his works command a high price to this day. In other lines of painting he also achieved fame, and there is a painting in the Louvre at Paris representing a wife reproaching her husband that exhibits his characteristics as a painter.

MAESTO'SA, a term in music, meaning with majesty or dignity. It is frequently followed by *con gravita*.

MAES'TRI, PIETRO, 1816–71; b. in Milan. He took a prominent part in the revolutionary movements in Italy in 1848, and became one of the heads of the provisional government; afterwards exiled and resident in France till 1859, when he joined the movement of Garibaldi for the unity of Italy. He founded and edited the *Statistica Generale* at Milan in 1861. In 1863 he published *La Francia Contemporanea*. He was connected with the Italian department of the Paris exposition of 1867 and published *L'Italia Economica*, which he continued to edit. He died in Florence, and his native city of Milan honored him with a cenotaph.

MAES'TRICHT. See MAASTRICHT, *ante*.

MAES'TRICHT BEDS. In Britain, the chalk with flints is covered with tertiary strata, but at Maastricht in Holland there occurs a thickness of 100 ft. of soft yellowish limestone, abounding in the remains of corals and bryozoa, sometimes, indeed, entirely made up of them. The fossils are peculiar, and quite distinct from tertiary species. Yet a considerable interval must have elapsed between the deposition of the Maestricht beds and the underlying chalk, for that has been abraded before the deposition of the newer beds. The most remarkable fossil found in these strata is the gigantic marine reptile mososaurus (q.v.).

MAFFEI, FRANCESCO SCIPIONE, Marchese, an eminent Italian author, was b. at Verona, June 1, 1675, and studied in the Jesuit college at Parma. He spent part of his youth in military service, under his brother ALESSANDRO, who greatly distinguished himself in the Spanish war of succession, and who finally rose to the rank of a field-marshal; but his love of literature prevailed over the desire of military renown, and he devoted himself to literary pursuits. He was for some time one of the editors of a critical journal, intended to promote among the Italians an acquaintance with foreign literature. His tragedy of *Merope* (Modena, 1713) was received with great approbation, and went through 70 editions in Maffei's lifetime. His comedy of *La Ceremonia* soon

followed, and was also successful. Maffei was a zealous promoter of the study of the Greek language and literature in Italy, and bestowed much labor on the examination of ancient manuscripts. His *Verona Illustrata* (Ver. 1731–32; new ed. 8 vols. Ver. 1792–93) is a work of much value and learning. He died Feb. 11, 1755. A collective edition of his works was published at Venice in 1790, in 21 vols.

MAFFITT, JOHN NEWLAND, D.D., 1794–1850; b. Dublin; joined the Wesleyan Methodists; came to the United States in 1819, and was received into the New England Methodist Episcopal conference. He was pastor for 12 years of several important churches. In 1831 he removed to New York, and traveled in various parts of the country, lecturing and preaching. In 1833 in connection with the Rev. L. Garrett he founded in Nashville, Tenn., the *Western Methodist*, a weekly journal. He preached extensively as a revivalist, his brilliant eloquence attracting immense congregations. In 1837 he was elected professor of elocution and belles-lettres in the La Grange college, Alabama. This position he held until chosen chaplain to congress in 1841. In 1845 he established at Auburn, N.Y., and edited *Calvary Token*, a literary and religious monthly. He was exceedingly dramatic and emotional in his style both of language and delivery.

MA'FRA, a small t. of Portugal, in the province of Estremadura, 18 m. n.w. of Lisbon. Pop. 3,500. It is remarkable only for its palace and convent, which form an enormously large and most striking edifice. It is 780 ft. in length and 690 ft. in width, contains in all 866 rooms, with 5,200 windows, and about as many doors: 10,000 men, it has been said, could be reviewed on its roof. It was built by king John V. (1717–31), and is splendidly fitted up and decorated. The library contains 30,000 vols., and is 300 ft. in length: its pavement consists of white and red marble; and the book-cases are made of the most costly woods.

MAGADOX'O, or MUKDIS'HA, a commercial t. on the eastern coast of Africa, on the Somali coast, in lat. 2° 2′ north. It was built by the Arabs in 924, for the purposes of trade, and was a flourishing place when the Portuguese first visited it. It now belongs to the imaum of Muscat, whose flag floats above the town. Pop., inclusive of slaves, about 5,000. It exports dhurra, beans, peas, cattle, cotton, spices, etc.

MAGALHA'ENS, DOMINGOS JOSÉ GONÇALVES DE, 1810; b. in Rio Janeiro, of an old Portuguese family; educated a physician. In 1836 he was attached to the Brazilian embassy to Paris. Returning to Rio in 1838 he became professor of philosophy, and then successively member of the chamber of deputies, and ambassador at Naples, Turin, and Berlin. He remained for many years in the latter position. He first published lyric poems in 1832 and subsequently has published from time to time works that have exhibited a constantly improving genius, and tendency to philosophical speculation. His *Mysterios* is one of the most esteemed of his works. *Antonio José* and *Olgiato* are two tragedies dealing with facts in the history of Brazil, and have been used on the stage. His most popular work in Brazil is entitled *A Confederaçao dos Tumoyos*, published in Rio Janeiro in 1857. It is a vivid picture of the defense of the Indians against the Portuguese, describes the founding of the city of Rio Janeiro, and is considered the national lyric of Brazil.

MAGALHA'ENS, or MAGELLA'NES, FERNANDO. See MAGELLAN, *ante*.

MAGALHA'ENS, FRAY GABRIEL DE, 1609–77; b. at Pedrogao, Portugal; united with the order of Jesuits at 16 years of age; sent as a missionary to India in 1634. In 1640 he set out for Japan, but having stopped at Macao he concluded to explore the interior of China. Having studied the Chinese language at Macao, he went to the western province of Szechuen, where he met with great success as a Christian teacher. A rebellion in the province while he was there exposed him to great peril, but nothing worse happened to him than to be wounded on one occasion by an arrow. He accompanied the victorious imperial army to the capital in 1648, where he gained the favor of the emperor and was permitted to build a church. But on the accession of a new emperor he was subjected to persecution, twice put to torture, and condemned to death, from which he escaped by the intervention of the regency. Three years later he was again arrested and ordered to leave the country; but an earthquake at the time caused a panic which diverted attention from him, and he remained in the country until his death at Pekin, when he was honorably buried by the emperor's order. He was of the same family as the great navigator, and his work in the French language, entitled *Nouvelle Relation de la Chine, contenant la Description des Particularités les plus Remarquables de ce Grand Empire*, is very highly esteemed by scholars.

MAGAZINE (a word derived from the Arabic *makhzan*), literally means any place where stores are kept; but as a military expression magazine always means a *powder-magazine*, although arms may at times be kept in it. A magazine may be a depot where vast quantities of gunpowder are held in reserve, an entrepôt for the supply of several advanced works, a battery magazine for the wants of a fortress during a siege, or merely an expense magazine for the daily requirements of the special battery in which it may be situated. The last is usually temporary, and hollowed out in the back of the rampart; but the other forms require most careful structure. They must be bomb-proof, and therefore necessitate very thick walls; they must be quite free from damp; and they should admit sufficient daylight to render the use of lanterns within generally

unnecessary. Magazines are commonly built of brick, the solid masonry being arched over within, and a thickness of earth sometimes added above the brick-work to insure impermeability to shells. The entrance is protected by shot-proof traverses, lest an opening should be forced by ricochet shots. Within, a magazine is divided into bins or compartments, and one of these should always be kept empty in order that the barrels of powder may frequently be moved from one place to another, a process necessary to keep it in good condition. A battery magazine commonly contains 500 rounds for the guns dependent on it. Depot magazines should, when possible, be limited to 1000 barrels of powder.

In a ship the magazine is strongly built in the hold; it is divided by a transparent screen from the *light-room*, in which are kept properly provided lanterns, the introduction of fire in any form into the magazine itself being absolutely forbidden. The explosion of the magazine is, of course, equivalent to the destruction of the ship, and therefore means are devised by which, on the least appearance of fire in its vicinity, the magazine may be immediately flooded.

The term magazine has been applied to a well-known class of periodical publications, usually issued monthly, and containing miscellaneous pieces in prose and verse, to which at one time was appended a chronicle of public events. The oldest of this class of works is the *Gentleman's Magazine*, begun by Edward Cave in 1731.

MAGAZINE GUNS. See BREECH-LOADING GUNS.

MAGDA'LA, a t. of Abyssinia, about 120 m. s.e. of Gondar, on the left bank of the Bachilo, a feeder of the Blue Nile, at an elevation of about 9,000 ft. above the level of the sea, and within a few miles of the mountains of the Falla country, the peaks of which are covered with snow for nine months of the year. Magdala was a small town, having a pop. of only 3,000 or 4,000, but it recently acquired note as the place of residence of the negus or king of Abyssinia, and as the place of captivity of the British prisoners, for whose rescue an expedition was at last sent out, in 1867, by the British government. Its rock fortress, approachable only by a narrow path up a steep ascent of 300 ft., and through a double line of defense, was regarded by the Abyssinians as impregnable; but it was forced, after a short but brave defense on the part of the few attendants who up to the last remained faithful to Theodore, on April 13, 1868. The town was found to be of the meanest description, the church and royal palace being in nowise exceptions to the prevailing dirtiness. The wealth of Magdala was insignificant. Before the departure of the English troops the town was burned and its defenses thoroughly destroyed.

MAGDA'LA, in Galatia, probably the birth-place of Mary Magdalene, i.e., Mary of Magdala. The name signifies tower or castle. It was on the lake Gennesaret, on the western shore. After the destruction of Jerusalem it was a seat of Jewish learning, and the rabbins of Magdala are often mentioned in the Talmud. A small Moslem village, now found on the shore of the lake, 3 m. w. of Tiberias, is supposed to represent the Magdala of Scripture.

MAGDALE'NA, the principal river of the United States of Colombia, South America, has its origin in a mountain lake at the s. extremity of the eastern Cordilleras. After a northern course of 900 m. it falls into the Caribbean sea, in lat. 11° n., long. 75° west. Of its course, the upper portion is rapid, and interrupted by many cataracts; the lower portion is through a great plain. It is navigable to Honda, 540 m. from its mouth; chief affluent, the Cauca. The area drained by the Magdalena is estimated at 110,000 sq. miles.

MAGDALE'NA, a state of Colombia, on the Caribbean sea, having Venezuela on the e., Santander on the s., and Bolivar on the w.; 26,950 sq.m.; pop. '70, 85,255. The surface is varied with mountains and valleys in all parts; the country is watered by the river Magdalena and its branches. The climate is severe, the temperature being generally oppressively warm. Yellow fever occurs at the sea-ports. The productions are tropical fruits, rice, cotton, coffee, sugar, tobacco, and cacao. Gold is found in the interior.

MAGDALEN COLLEGE, Oxford; in full, the college of St. Mary Magdalene. William Patten, commonly called Waynflete, from the place of his birth, successively head master of Winchester, head master and provost of Eton college, bishop of Winchester, and at the same time lord high chancellor, founded the hall of St. Mary Magdalene in 1448. In 1457 he obtained a license from the king to found a college, into which he transferred the president and scholars of the hall. Magdalen is in many respects the most remarkable college in Oxford, and Wood declares it to be "the most noble and rich structure in the learned world, that is to say, that if you have regard to its endowment, it excelleth, all things considered, any society in Europe." There were on the original foundation a president, 40 fellows, 30 scholars called demies, 4 chaplains, and 16 choristers. The fellowships and demyships were confined to certain specified dioceses and counties. By ordinances passed under the powers of 17 and 18 Vict. c. 81, the constitution of the college has been considerably changed. Certain statutable restrictions on fellowships and demyships are abolished. The demyships are of the value of £95 per annum, and 10 are to be added to the statutable number. Twenty

exhibitions of the same value were at the same time founded. Four professorships—of moral philosophy, chemistry, mineralogy, and physical geography—of the value of £600 per annum, are to take the place of three lectureships—of divinity, moral philosophy, and natural philosophy, which were founded by Waynflete. In order to carry out these changes, ten of the fellowships are suspended. By the same ordinance it is directed that the fellowships are not to exceed £300 per annum, exclusive of rooms. This college is one of great beauty, and, as is well known, is rich in historical associations. It has 41 benefices in its gift.

MAG'DALENE, MARY, or MARY OF MAGDALA, so named from a town on the sea of Galilee, a woman "out of whom Jesus cast seven devils," and who believed in him and followed him. She was one of the women who stood by his cross, and one of those who went with sweet spices to the sepulcher. To her he first appeared after his resurrection. In consequence of an unfounded notion identifying her with the woman mentioned in Luke vii. 36–50, who anointed our Lord's feet with ointment, and wiped them with the hairs of her head, Mary Magdalene has been long and generally regarded as a woman whose early life had been very profligate, although of this there is no hint whatever in the narratives of the evangelists; and the Magdalenes so frequent amongst works of art represent her according to this prevalent opinion. The very name Magdalene has come to be applied to women who have fallen from chastity, and institutions for the reception of repentant prostitutes are known as *Magdalene asylums.* See PENITENTIARIES.

MAGDALENE COLLEGE, Cambridge, was founded in 1519 by Thomas, baron Audley of Walden, who left for this purpose the impropriate parsonage of St. Catherine Cree church, London, and also a considerable part of the city, anciently called Covent garden, Christ church. It has eight open fellowships on the foundation. Four of the fellowships are named after persons who have made benefactions to the college—Spendluffe, Wray, Drury, and Millington. Magdalene college has 12 scholarships—3 of £60, 3 of £40, and 6 of £20 each—all of which are likewise named after their founders; besides 13 exhibitions, 5 of which are for scholars from Shrewsbury school, 4 for scholars from Wisbeach school, and 4 for scholars from Leeds, Halifax, and Heversham schools. There is also an annual benefaction, called the Pepysian, worth £50, in the gift of the master, and generally bestowed by him upon poor and deserving students. Magdalene college, in 1879, counted 62 undergraduates, 129 members of the senate, and 228 members on the boards.

MAGDALEN HALL, Oxford. This hall was founded at the same time as Magdalen college. Up to 1602 it was a sort of school for students, previous to admission to the college, and was governed by one of the college fellows. It then became an independent hall, and in 1822 was removed to the seat of the former Hertford college. This hall presents to one benefice, and possesses 8 scholarships and 4 exhibitions, all tenable for 3 years.

MAGDALEN ISLANDS, a small group near the center of the gulf of St. Lawrence, 54 m. n.w. of Cape Breton island, and about the same distance n. from Prince Edward's island. They consist chiefly of Coffin, Amherst, and Grindstone islands, with about 2,000 inhabitants, who are supported by the productive cod, herring, and seal fisheries of the neighboring waters.

MAGDEBURG, chief t. of Prussian Saxony, is situated in 52° 8′ n. lat., and 11° 40 e. long., has a pop. '75, of 122,789 (including its suburbs and its citadel), and is one of the most strongly fortified and most important commercial towns of Prussia, and the focus of four of the principal lines of railway in Germany. It lies on the left bank of the Elbe, and is surrounded by extensive suburbs, known as Neustadt and Sudenburg, but with the exception of one long and wide thoroughfare, the *Breite Weg* (Broadway), it consists mostly of narrow and crooked streets. Magdeburg is the seat of the governmental courts of appeal and administration, and of a superintendent-general of the evangelical church. It has two gymnasia, a normal school, institutions for the deaf and dumb, and blind; schools of arts, trades, practical mining, medicine, surgery, and midwifery; and is well provided with institutions for the promotion of charitable purposes. Its most remarkable buildings are the cathedral, built between 1208 and 1363, and containing the graves of the emperor Otho, the founder of the city, and of his first wife, the English princess Editha, and the sarcophagus of archbishop Ernest, sculptured in 1497 by P. Vischer of Nuremberg; the town hall, in front of which stands the memorial of Otho the great, erected after his death, in 973, by the magistracy of Magdeburg, in grateful remembrance of the favors which he had conferred upon the city; the government house, the barracks, and the theater. The industrial products of Magdeburg embrace silk, cotton, and woolen goods, gloves, ribbons, and leather, and it has manufactories of tobacco, chicory, lead, sugar, and vinegar, and extensive breweries and distilleries. The transit and commission trade is very considerable; there are annual wool and other markets; and trade is facilitated by rail, and by steam and canal navigation. In 967 Magdeburg was raised to the dignity of being selected by pope John XIII. as the see of the primate of Germany, while it had already acquired the rights of a free city under Charlemagne. During the middle ages, the archbishops and the magistracy were frequently at war; and Magdeburg early adopted the reform doctrines, and thus

brought upon itself the combined wrath of the emperor and the archbishops. Its greatest troubles are, however, connected with the thirty years' war, when, after sustaining a siege for 28 weeks against the imperialists, under Tilly, the city was taken, sacked, and nearly burned to the ground; the cathedral and about 150 houses being all that remained after the three days' sack to which it had been exposed. Thirty thousand of the inhabitants were slain, and numbers threw themselves into the Elbe, to escape the fury of the invaders. In 1648 the archbishopric was converted into a secular duchy, and conferred upon the house of Brandenburg in compensation for the loss of Pomerania. In 1806 it was taken by the French and annexed by them to the kingdom of Westphalia; but finally restored to Prussia in consequence of the downfall of Napoleon. in 1814.
